A snction sand dredge with a capacity of 4000 tons per hour has been built by the Naval Construction and Armaments Co., of Barrow-in-Furness, England, for work on the Mersey bar, near Liverpool, says the *Engineering News*. The sand-pumping machinery consists of two centrifugal pumps with 36-inch suction and delivery pipes. These pumps are on each side of a well and draw from a T-head at the top of the suction pipe, and around this head as a trunnion the tnbe can be raised or lowered to snit the depth of the water, and a ball and socket joint gives a certain amount of lateral mo-

tion. The suction nozzle is turned over at the bottom with its aperture almost at right angles to the axis of the tube.

The hull of the dredge is 320 feet long by 46 feet 10 inches wide, with a depth of 20 feet 6 inches, and the loaded draft is 16 feet 4 inches. She has twin-screw engines and a speed of 10 knots loaded. The sand is pumped into hoppers, and on a recent trial on the Mersey these hoppers were filled at the rate of 100 tons per minute.

To Raise the San Pedro.

Moran Brothers, foundrymen of Seattle, are about to undertake the wrecking of the steamer San Pedro, lying on Brotchie ledge, Victoria harbor. They will proceed on the same lines adopted without success by Captain Lachlan for the owners, the Southern Pacific Company. Moran Brothers will, however, bring into service, in addition to the powerful machinery utilized by Captain Lachlan, twelve large centrifugal pumps, which have been specially manufactured for the occasion. Each of these has a capacity of over twenty tons of water a minute, a continuous stream of about the diameter of a good-sized barrel, and, provided the holes in the hull are stopped, can empty the San Pedro of water in less than a quarter of an hour. The first detail of the work is repairing the injuries received by the coffer dam during the recent gale. Then active operations will commence.

Fast Passenger Whaleback.

The whaleback passenger steamship Christopher Columbus, says *Seaboard*, has created consternation in the circles of the passenger trade all over the lakes because of the records she has made between Chicago and Milwaukee for speed. She has been making twenty miles an hour easily, and this with but 2600-horse power in a vessel 361 feet long, 45 feet beam and 24 feet depth of hold. The secret is that she is of a type that sets aside the notions that have dominated in ship construction since it began and, instead of building a great freeboard with a corresponding waste of material and weight in order to "overcome" or "combat" the seas and the wind, she presents to both a surface that is specifically designed to minimize the effect of the wind and to offer no resistance to the seas above the water line.

Consolidating Steel Ingots.

At the Nykroppa Iron Works, in Sweden, steel ingots are consolidated by pressure arising from centrifugal action. In the center of the casting pit is an upright shaft carrying four arms, to each of which is jointed an ingot mold. The molds are filled, and then the shaft is set in motion. As the speed increases the molds gradually move from the vertical to the horizontal position, and a pressure is developed in the fluid metal equal to 30 times that due to the head in the first instance. This drives out the gases and produces solid castings. The circumference of the circle described by the molds is 67 feet, and the velocity is nearly 10,000 feet per minute. The inventor of the process is Mr. L. Sebenius.

Utilizing a Waterfall.

It is proposed to distribute power from a fall on the River Aar at Wynau, Switzerland. There is some 2000-horse power available, and it is intended to use two media in its distribution, namely, compressed air for distances up to three miles, and electricity up to twelve miles. The high-tension current will be transmitted by naked copper conductors, carried on special insulators, at a pressure of 8000 volts. In the turbine-house at Wynau will be five compressors capable of furnishing 2500 cubic metres of air per hour at eight atmospheres pressures.

Books on Working Ores.
BY GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.
This rare book on the treatment of gold and silver ore without quicksilver is herally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco
BY C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Useful Information.

Germany's Zinc Product.

Germany produces more zinc than any other country in the world; the exportation of zinc is accordingly very heavy, amounting to 28,000 tons, against an importation of not quite 9000 tons, says *Kuhlows*. The main zinc-production district is in Upper Silesia, where the metal is made from calamine, and also more and more from zinc blende, by distillation. The smelting of zinc blende has led here, as in other places, to the establishment of very perfect arrangements for utilizing and preventing the deleterious effects of the sulphurous acid generated in the roasting of the ore. In Germany, in 1890, 139,000 tons of zinc were smelted, in which work 9271 men were employed. The value of the output was 62,000,000 marks ($15,500,000 approx.), of which 64 per cent was produced in Upper Silesia, 20 per cent in the Arnsburg district, and the remainder in the Government districts of Dusseldorf and Aachen (Aix-la-Chapelle) and the kingdom of Saxony. The ore in the western parts of the country is in the main zinc blende. The smelting of zinc is made very difficult, in most localities, by the presence of other metals in the ore. However, by a careful preparation of the ores and purification of the zinc obtained, this difficulty has been overcome. By the use of regenerative gas heating furnaces and well-adapted condensers the cost of production has been reduced and loss of metal prevented. With the smelting of zinc a small production of cadmium is connected.

Abuse of the Stomach.

Different constitutions have peculiarities in regard to the way in which they assimilate food, and the old adage that what is one man's meat is another's poison, is a very true one, says the *Popular Science Monthly*. There is no ailment more common in middle life and in old age than indigestion. This, of course, depends upon improper food taken too frequently and in undue quantity. As a rule, the victim of indigestion flies to medicines for relief, or to one of the thousand-and-one quack remedies that are advertised to cure everything.

How much more rational would it be to alter the diet, and to give the stomach the food for which it is craving? If the stomach could talk, I can imagine it, after pills, and gin, and bitters, and quack remedies of every description have been poured into it, begging to be relieved of such horrors, and saying, "Give me a little rest, and a cup of beef tea and a biscuit, and go and take a little fresh air and exercise yourself." Instead of this, the miserable organ has to be dosed with all sorts of horrible concoctions in the way of drugs, brandies and sodas, and champagne, to endeavor to stimulate it into action. There is no doubt that the stomach that requires stimulants and potions to enable it to act efficiently, can hardly be said to be in a healthy state, or can long continue to do its work properly.

The digestive organs, unfortunately, are the first to sympathize with any mental worry. They are like a barometer, and indicate the errors of malnutrition and its consequences. The healthy action of every organ depends upon the proper assimilation of the food taken. As soon as the digestive process fails, everything fails, and ill-health results with all its disastrous concomitants.

Remedy for Toadstool Poisoning.

Captain McIlvane's recommendation when, by mischance, any of the poisonous toadstools have been eaten, published by him in the *Therapeutic Gazette*, is as follows: "The physician called upon to treat a case of toadstool poisoning need not wait to query after the variety eaten; he need not wish to see a sample. His first endeavor should be to ascertain the exact time elapsed between the eating of the toadstool and the first feeling of discomfort. If this time is within four or five hours, one of the minor poisons is at work, and rapid relief will be given by the administration of an emetic, followed by one or two moderate doses of sweet oil and whisky in equal parts. Vinegar is effective as a substitute for oil. If from 8 to 12 hours have elapsed, the physician may rest assured that amanitine is present and should administer one sixteenth of a grain of atropine at once."

The atropine should be subcutaneously injected, and the injection repeated every half hour until one-twentieth of a grain has been given or the patient's life has been saved.

Healthy Bed Clothing.

In hospital, as well as in private practice, great errors are made in the matter of bed clothing for the sick, and particularly for the sick who are suffering from febrile affections. We have got rid of the heavy curtains around the bed; of the grand accumulator of dust and other uncleanliness, the tester; of the heavy valiance which converted the underpart of the bed into a close cuphoard, in which all kinds of unwholesome and cumbrous articles lay concealed, including sometimes excreted matter itself; and we have banished the carpet, which, often a hard-trodden, dust-laden rag, made the floor beneath the bed persistently impure, says *Hall's Journal of Health*. But the old feather beds, flock mattresses, heavy blankets, thick, impermeable and dense counterpanes still encumber many a patient, rendering ventilation of his body as impossible as in the days of our forefathers. The thick, dense bed and mattress require to be replaced by the light steel elastic bed, and the clothing under and upon the patient, now so close and heavy, requires to be replaced by clothing that is porous, so that it can be permeated with pure air from without, and can at the same time permit the warm and impure air from the patient to have free exit. The mistake now so generally made lies in the idea that the warmth which the bed calls for is best obtained by close material and close packing. The error is positive. There is nothing that retains warmth in so good and equable a manner as common air at rest. Dense materials cannot keep the body respirably warm. Materials, therefore, both for the bed and for the bed clothing, ought to be porous to a free mechanical extent of porosity. The rule holds good for the clothing of the body in health; in sickness it is imperative.

Rest in Motion.

"If I am harried or wearied by care or work," said a man who works with his brains, "I can always find rest in motion. I just stop work and get out and walk. As I walk, the weight is lifted, and finally it is gone altogether, and in place of that tired feeling comes tranquility succeeded by elation. It was a pleasing discovery to make, that I could walk out of depression into buoyancy. At first when the exercise was new to me, I needed to go but a little distance to accomplish this happy result, and so clearly defined was the change that I could locate almost exactly the spot where my burdens disappeared and I found myself in the pleasant company of my hopeful, kindly friend, Cheerfulness. I still seek Cheerfulness by that road and I find him unfailingly; but I have to go farther and farther to meet him, for, like any other stimulant, the walk must be taken in constantly increasing doses in order to produce the same results. At first a brisk walk of a quarter of a mile brought me to the boundary line; now I find it about a mile and a quarter away. It may be that I will have to seek Cheerfulness nearer home as a permanent atmosphere, for it is obvious that if I must go greater and greater distances to meet the personified Cheerfulness, he might one day be practically beyond reach."

The Annual Ring in Trees.

The average rings in trees exist as such in all timber grown in the temperate zone, says the *Builders' Gazette*. Their structure is so different in different groups of timber that, from their appearance alone, the quality of the timber may be judged to some extent. For this purpose the absolute width of the rings in regularity in width from year to year, and the proportion of spring wood to the autumn wood must be taken into account. Spring wood is characterized by less substantial elements, the vessels of the thin-walled cells being in greater abundance, while autumn wood is formed of cells with thicker walls, which appear darker in color. In conifers and deciduous trees the annual rings are very distinct, while in trees like the birch, linden and maple the distinction is not so marked because the vessels are more evenly distributed. Sometimes the gradual change in appearance of the annual ring from spring to autumn wood, which is due to the difference in its component elements, is interrupted in such a manner that a more or less pronounced layer of autumn wood can apparently be recognized, which again gradually changes to spring or summer wood, and gradually finishes with the regular autumn wood. This irregularity may occur even more than once in the same ring, and this has led to the notion that the annual rings are not a true indication of age; but the double or counterfeit rings can be distinguished by a practical eye with the aid of a magnifying glass. These irregularities are due to some interruptions of the functions of the tree, caused by defoliation, extreme climatic conditions or sudden changes of temperature. The breadth of the ring depends on the length of the period of vegetation; also when the soil is deep and rich, and light has much influence on the tree, the rings will be broader. The amount of light and the consequent development of foliage, is perhaps the most powerful factor in wood formations, and it is upon the proper use of this that the forester depends for his means of regulating the development and quantity of his crop.

Why Better Western Than Eastern Records?

A correspondent writes to the New York *Commercial Bulletin* asking why better western than eastern records are made by the European steamships crossing the Atlantic? The interrogation editor says in reply that the gain or loss of time between noon and noon in going east or west has no effect upon the comparative time of passages across the Atlantic. Allowance is made for this in announcing the time of passage. That the westward record is the better arises mainly from the following facts: (1.) The Welsh bituminous coal, which steamers burn going west, gives better results than the American bituminous coal used upon the return trip. (2.) The usual western track is from 20 to 30 miles shorter than the eastern. The quickest westward passage was made over a track of 2782 miles, and the best eastward passage over one of 2811 miles—a difference of 29 miles in favor of the western record. (3.) Vessels coming in this direction are assisted by the Southwest current.

New Safety Matches.

Safety matches that can be used without a box are to be placed on the English market by a German inventor. The idea is to tip the two ends of the wood separately with those compositions which in the ordinary way go one on the box and the other on the match. To use, break the wood across the middle and rub the ends together.

Electricity.

Is Electricity to Replace Steam?

In a pamphlet recently compiled by a British civil engineer, Mr. F. B. Behr, it is argued that existing railways are unequal to sustained speeds of 120 or 150 miles an hour, because (1) their curves are too sharp (2), the lateral strain from centrifugal force with such velocities is too great for an outer rail unless it be elevated to an undesirable degree, and (3) the drivers of steam locomotives are inadequate to the rapid rotations required. The present maximum with safety he assumes to be 50 or 60 miles an hour, and this he believes cannot be exceeded without constructing new lines, and after new designs. He therefore recommends the separation of lightning express traffic from the slower passenger and heavy freight service, the elimination of way stations requiring frequent slowing down and starting up, flatter curves and the use of electric motors attached to each car in the train (as in the Intramural road in Chicago) rather than one locomotive to haul them all, thus dispensing with much needless weight, yet securing superior efficiency. His most radical proposition, however, is to operate such electric cars upon a one-rail road.

This structure will be about five or six feet high, with a triangular cross-section, and lengthwise it would be a continuous girder or cantilever. A heavier rail than is now in use (say 120 pounds to the yard) would surmount the trestle, and on each side, down about three feet from the crest, there would be guide rails. Upon this "permanent way" the cars would ride, saddle-fashion, the sustaining wheels being mounted in the crotch of each one, and the lower edges on either side would carry bearing wheels on their inner surfaces, touching the guide rails. The bottom of a car therefore would be only two or three feet above the ground. The engineering details have all been worked out quite carefully, the cost of constructing has been estimated, and even the luxurious fittings of the coaches have been considered. Mr. Behr also proposes to reduce atmospheric resistance by providing wedge-shaped fronts to his vehicles, and there are some original features to his method of connecting dynamos to axles.

The New York *Tribune* tells of a single rail system, such as Mr. Behr would adopt for fast service but with various modifications, which has been in operation for several years in Ireland, on a line 9½ miles long, between Listowel and Ballybunion, and is called the Lartigue system, presumably after the inventor. And another road of exactly the same character has recently been constructed from Feurs to Panissieres, in the Department of the Loire, France, and it was to be opened for business last month. Neither line was built with a view to extraordinary speed, but both are equipped with electric cars, each with its own motor, and run in trains, not singly.

Electricity in Gardening.

By the use of electric light the Hon. W. W. Rawson of Arlington, Mass., claims he makes a gain of five days in each of his three crops of lettuce—that is, two weeks in a season; that the gain on one crop pays all the expense of the electric lighting for the season, thus giving him the gain on the other two for extra profit. His attention was first called to the usefulness of the light by the advance made in the growth at the ends of the greenhouse next the street and in the glare of the electric light. This was so marked that he introduced the light through his lettuce and cucumber houses. Dr. Bailey of Cornell University says, as the results of his own experiments, that the influence of the light is greatly modified by the interposition of a glass roof. Plants injured by a naked light were benefited by the pro-

tected light. Five hours light per night at a distance of 12 feet hastened maturity a week or ten days, hut proved injurious to new plants and those newly transplanted.

Agricultural Electricity.

An interesting example of electricity as applied to farm work is now in operation at a Scotch farm, says the *Scientific American*. The whole of the nsnal farm machinery, such as thrashing, sowing, corn thrashing and the like, is here driven by an electric motor. The electricity is generated hy water-power, the tnrbine wheel which drives the dynamo heing abont 1000 yards from the farm. The electric current is conveyed hy nndergrond wires to the honse and farm, in each of which a storage battery is placed. These supply the electric cnrrent for lighting and motive purposes when the machinery is not working. The whole of the mansion is illuminated by electric light, and an electric motor is provided for pnmping the water for domestic purposes.

Inexpensive Electric Clock.

Herr Von Hefner-Alleneck, of Berlin, has devised a clock which is claimed to solve the problem of providing an inexpensive yet effective system of electric control of clocks. It is placed in circuit like an ordinary incandescent lamp. The current keeps the clock wound at an annual cost oot exceeding that of one 16 candle lamp bnrning for ten hours —perhaps eight or ten cents. Shonld the circuit be broken, the clock will run without cnrrent ahout 12 hours. The regulation can he performed hy hand from the dynamo-room or automatically from an observatory, and consists of a momentary lowering of the circnit potential by six to ten volts at 5 A. M., the effect being to set all the clocks in the circuit at 5. The lamps are not appreciably affected.

Electric Ambulance.

An electric ambnlance is the latest development in St. Lonis. It will be as swift and steadier than a vehicle drawn by horses, and will be given right of way by the street-car companies. In some cities the electric street railways want to undertake the carriage of the city scavenging, and there seems no reason why they should not do the work well. In Ottawa the street railway has offered to carry the mails between the depots and the postoffice. It looks as if the time was coming, says the *Electrical Review*, when a citizen wonld have to take an electric ride out into the country to see a horse.

Against Paraffin.

The accidents caused by high-tension electric currents have lately heen discussed by the electrotechnicians of St. Petersburg, and we understand they have passed a unanimous resolution against the use of paraffin in the construction of accnmulators, and resolved that when putting an accumulator together a way of escape shall always be left for gasses.—Invention.

To Record Changes of Temperature.

Changes of temperatnre are now recorded hy an electrical apparatus produced by a Frenchman. It is a metal ampulla half full of ether hermetically sealed, and when the temperature rises the ether expands and slightly raises the cover, which completes an electric circuit, rings a bell, and warns those who want to know that the temperature is going np.

From Nothing to Near a Billion.

A writer gives an illustration of the progress of electricity as a mechanical power. He says that 25 years ago it was unknown, and that $900,000,000 is now invested in various kinds of electrical machinery.

FRANCIS SMITH & CO.,
MANUFACTURER OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pips on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

THOMAS PRICE & SON,
ASSAY OFFICE, SAMPLING WORKS,
AND
CHEMICAL LABORATORY,
525 SACRAMENTO STREET, - - SAN FRANCISCO, CAL.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.
THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill supplies.

Extra sizes and lengths made to order on short notice.
611 & 613 Front St., San Francisco, Cal.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.
THE BEST NEWSPAPER published in the district is
THE TIDINGS.
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.
H. S. SPAULDING, Publisher.

PRACTICAL TREATISE ON HYDRAULIC MINING.
By AUG. J. BOWIE, Jr.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Gradee, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

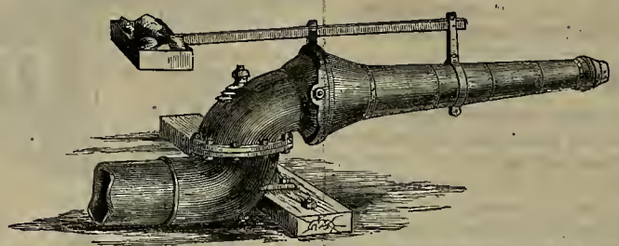
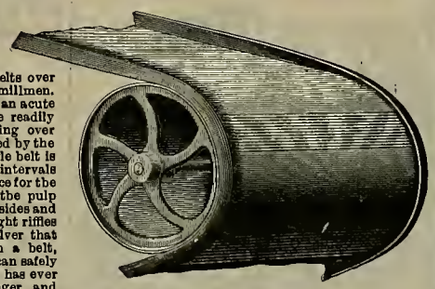
IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 51 Fremont St., San Francisco.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

A Letter to Miners.

The Fair Committee of the State Miners' Association has gone systematically to work in the preparation of the proposed mining exhibit at the Midwinter Fair. It has just issued a circular letter, which is as follows:

No complete and full representation of the mining industry has ever been made at any public exhibition or fair on this coast. The varied agricultural and horticultural features of the State have, however, been so fully and frequently brought to public notice in this way that they have, in a measure, overshadowed those of the mines, and many have come to believe that the mining industry of California is of small proportions. In fact, it is largely owing to these circumstances that in public estimation, for instance, either the wine, raisin or orange crop of each year is supposed to be of more value than the mineral products of the State. The fact is, however, that all three combined do not nearly reach a value of $13,000,000 annually, as our gold product alone does. Nor is the mineral industry of California confined to gold alone, but includes silver, lead, quicksilver, borax, chrome, antimony, manganese, lime, marble, building stone, petroleum, asphaltum, bituminous rock, clays, coal, salt, alum, asbestos, bismuth, tin, cement, plumbago, gypsum, iron, infusorial earth, kaolin, metallic paint, mica, nickel, ochre, rock soap, slate, sulphur, talc and other substances. It is not out of place to state, in this connection, that in the mass of "immigration literature" issued in this State few, if any, of these substances are even mentioned as products of California, yet in several instances they are produced nowhere else in the United States.

The value of the total mineral products of California is about $20,000,000 per annum. The record of California for gold alone is one to be proud of, for it leads all the geographical divisions of the world and eclipses everything in history. Over $1,250,000,000 in gold has this State given to the world in 43 years; nearly $1,300,000,000 added to the world's wealth by this one State of the Union. It is not a past record alone on which this industry bases deserved recognition, for though California has always, since the discovery, far distanced annually all the other States in gold yield, it to-day turns out over $7,000,000 a year more than any other State, notwithstanding the decreased yield owing to the mistaken policy of closing down the hydraulic mines, which produced about $10,000,000 more. California alone produces to-day over one-third of the annual gold output of the United States.

The gold product of the State may be still further increased by the investment of capital in undeveloped properties. One of the main objects of the proposed display at the coming Midwinter Fair is to bring prominently before the public the importance of the mining interests, that the attention of capital may be attracted here. But, as stated, it is not on gold alone that the mines of California depend. Work in none of the departments of the mineral industry has ceased; it is still being carried on in all and with success. But only those directly interested understand or realize the importance of the different branches.

An adequate and proper display, which shall represent all these varied branches of the mining industry, will be of incalculable advantage. Probable investors, not only in our own communities, but from outside our borders, must be shown what we have to become interested. It rests with the mining men of this State to see their industry represented before the people in a suitable manner. The California mining display at Chicago was by no means equal to those of other less important mining sections of the country, but the judgment of the public is based upon what they see, and the miners of this State cannot afford to let this opportunity pass—the first one they have had on this coast—without making an earnest effort for a grand display, which shall show to the world how important and varied is the mining industry of California.

The Midwinter Fair management has granted free for this purpose 10,000 square feet of space in which to make the proper representation of the mining industry. If special mining or mineral exhibits by separate counties, individuals or corporations are made elsewhere, the necessary space must be obtained from and will be charged for by the Midwinter Fair Commission, which fact should be understood by the county committees. In the space already set aside for the general State mining exhibit, allotments will be made to the counties without charge and they will be allowed to make their own installations, if so preferred. These must be, however, under the supervision of the executive committee, so that there shall be a harmonious whole when completed. The space being limited the exhibits must be compactly arranged, and upon one general plan, for which reason the miners' executive committee reserves the right of supervision. They will be prepared to give receipts for all articles sent to the exhibition. Safes will be provided for valuable specimens, police protection given, watchmen will be employed by night and day, and every possible care taken of articles on exhibition, but the committee can assume no financial responsibility in this connection.

Counties making separate installations must provide their own cases for specimens, etc., but if articles are sent directly to the committee show-cases will be provided. It is expected that each county, at its own expense and for its own benefit, will provide a competent representative, who shall not only have care of its exhibit, but be able to describe the mineral resources of the section.

The exhibits of ore, quartz or other minerals for the mining department will be transported both ways free of charge by the Southern Pacific Company, it being understood that the same are for exhibition only, having no commercial value or, if valuable, not being intended for sale. It is understood that if any lots of ore are turned over to the smelter, or otherwise disposed of commercially, the company shall be guaranteed regular freight rates on the same.

The County Commissioners are urged to make as much haste as possible in their collection of exhibits and promptly inform the executive committee of the space required. The executive committee reserves the right to so arrange the space at command as to allot it in proportion to the importance of the display.

Coast Industrial Notes.

—Shingle certificates circulate as currency at Blaine, Wash., stores.

—An effort is being made to organize a union of sealers at Victoria, B. C.

—The Prescott & Arizona Central railroad has withdrawn its trains. The road is 72 miles long, but since the building of the Santa Fe, Prescott & Phœnix road the latter has had all the business.

—Subscriptions amounting to $2000 have been received for improving the Big Tree road at Santa Cruz, which will be one of the points of attraction for Eastern and foreign visitors during the Midwinter Fair.

—The San Francisco and San Mateo railway has commenced to run cars through from the ferries at Market street to Baden, or new South San Francisco. Half-hourly trips are made and a tariff of 15 cents charged for the fourteen-mile ride to the meat city.

—The North Pacific Coast railway has passed into the hands of James B. Stetson, A. Borel, Mr. Coleman of Grass Valley, C. de Guigne and the Scottish-American Investment Company. J. B. Stetson is now president, A. Borel vice-president and the directors are the new owners mentioned above.

—A receiver has been appointed for the Pullman Mercantile Company at Pullman, Wash., of which L. M. Ringer, a respected citizen of 20 years' residence, is president. The assets are $200,000 and the liabilities $135,000. H. G. Depledge, cashier of the First National Bank of Pullman, is the receiver.

—A disastrous fire occurred at Gold Beach, Or., October 18th, by which R. D. Hume's salmon cannery, hatchery, merchandise store and several other buildings were destroyed. The fire started in the lacquer room of the cannery and it is said that evidence points strongly to incendiary work. The loss will reach $75,000.

—The new board of directors of the Northern Pacific has organized by electing Drayton Ives president, Robert Harris vice-president, C. H. Scott of Tacoma second vice-president, George S. Baxter treasurer, George H. Earl secretary. S. W. Petrit was appointed general attorney and J. A. Barker general auditor.

—The steamer Mariposa, which sailed last week for Honolulu, carried from Captain Whitelaw's wrecking establishment an anchor weighing 10,280 pounds, a large steam pump and eleven purchase blocks, to be used in attempting to get the stranded steamship Miowera off the coral reef near the entrance to Honolulu harbor.

—The changing current of the Santiam in Oregon is threatening to render useless the Sanderson bridge. It has already cost about $30,000, and the Linn county, Or., officials are debating whether it will be cheaper to keep following up the changing channel or tear the bridge down and rebuild it at some point where it is more permanent.

—The creditors of the Geyser Water Company have petitioned the Supreme Court to have the company declared insolvent. The petitioners and the amounts due them are as follows: Dickman, Jones & Co., $11,272; Holbrook, Merrill & Stetson, $624; Abrahamson & Bacon, $555; Solomon & Co., $260; M. H. de Young, $3228.

The directors of the Washington Aluminum Manufacturing Company at Ellensburg, Wash., have elected J. M. Hirsh of Chicago president and voted to set aside 20,000 shares to begin with as a working capital. Work will begin on the preparatory features of the plant as soon as possible. The aluminum will be extracted by Hirsh's electric process, and the dynamos and other machinery will be run by water power.

—The powder-house of the Kutner-Goldstein Company at Fresno was set on fire and blown up one night last week. Nearly all the homes near by were wrecked. On Mariposa street, nearly a mile and a half from the explosion, the sidewalk is covered with broken glass. The Hughes hotel suffered heavily. Twenty-seven windows are broken. This building is a mile and a half from the powder-house.

—The mercantile agency of R. G. Dunn & Co. reports that Wright, Browne & Co., ship chandlers and commission merchants at 34 and 36 Steuart street, have placed their business property in the hands of a trustee for the benefit of their creditors to meet liabilities aggregating $130,000. The firm is one of the oldest in its line on this coast and until three weeks ago was considered "solid as a rock."

—The Southern Pacific shops are to be run on full time. The change has gone into effect and applies to all points on the system between Portland and El Paso. During the time of the greatest stringency the working days in the company shops were reduced to four a week. In returning to the old schedule the men will work six days a week of eight hours each. This order will affect about 5000 men, and will increase the pay-roll about $100,000 a month, or $1,200,000 a year.

—The winter-time schedule of the coast division, Southern Pacific railroad, has gone into effect, and the Sunday excursion trains to Palo Alto and Monterey have been discontinued. Another noteworthy change in the movement of trains is the leaving time of the early San Jose train, which leaves the Third and Townsend-street depot at 6:45 A. M. instead of 7. This change is chiefly for the benefit of pupils attending school at Palo Alto. The midday train for the cemetery and Palo Alto will leave at 12:25 P. M. instead of 12:05 P. M.

—The Dickens-Hobart Lumber Company of San Francisco decided at a meeting of its stockholders, held October 4th, to transfer to J. B. Dowling, in trust for the benefit of creditors, all of its assets. The cause alleged for the course is inability to meet current debts. Mr. Dowling will assume management of the corporation's affairs and will conduct its business in accordance with the wishes of a majority of the creditors. The inventory of assets and liabilities filed in the Hall of Records shows that the concern has debts aggregating $21,651, and assets amounting to $29,794.63.

—The League of Progress has been investigating the telephone rates of San Francisco, and it announces that they are higher than elsewhere. The cost here is from $150 to $300 annually, and the rates in other cities average about one-third of this sum. Some of the rates are as follows: Memphis, $48 and $60, residence and business rates respectively; Detroit, $50 and $72; Louisville, $60 and $72; Chicago, $100 and $125; Baltimore, $78 each; St. Paul, $60, and from $72 to $96; Minneapolis, $60 and $72; and in Buffalo, a flat rate of from $50 to $130, according to the number of calls.

—The special committee of the Oakland City Council on water supply has prepared a basis upon which estimates will be received from companies desiring to bid for a city water system. Every bidder must agree to deliver water at a graduated price per 1000 gallons, under a pressure of 50 pounds per square inch, and in a minimum quantity of 2,300,000 gallons and a maximum quantity of 10,000,000 gallons. The successful bidder must agree to give the city an option to purchase the plant within ten years at a price not to exceed 10 per cent in excess of the cost, with interest at 6 per cent per annum until purchased.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

MINING AND SCIENTIFIC PRESS. The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW STAMP MILL.—*Ledger*, Oct. 20: The five-stamp mill recently purchased by the Farrell Mining Company at Middle Bar, is rapidly being placed in position.

The Argonant Company, whose property is located south of the famous Kennedy, broke ground Wednesday, for its three-compartment shaft.

The tunnels now being driven through the Albany grounds are cutting stringers of quartz giving low assays.

The property which for some time has been prospected by Farrell, Wise & Seligman at Middle Bar has been incorporated under the name of Farrell Mining Company.

J. B. Francis returned from a trip to San Francisco Wednesday night, and brought back with him coin to pay off the employes of the Alma. Work is progressing on that property as rapidly as number for the various buildings arrives, two men being engaged in framing timbers. The hoist and engine are on the road from San Francisco, and will be put in position as soon as they arrive. The shaft is now down about 70 feet, as far as it is profitable to go until the new hoist is in position.

Butte.

ONE MORE QUARTZ MILL.—Marysville *Democrat*: G. W. Price of Forbestown has let a contract for the erection of a new ten-stamp mill on a quartz ledge owned by him and known as the Colorado. The ledge is within a short distance of Forbestown, and development work has shown it to be extensive and rich, the ore running high in free gold. Mr. Price is to have his mill running inside of 60 days. To supply water to this and other mines in that vicinity the Forbestown Ditch Company is now engaged in reconstructing an old line ditch running to the north and west of Forbestown. The expenses of this repair will be about $1000, and water can be supplied to several mines now being developed. When this mill is completed there will be 90 stamps in operation in the Forbestown district, not including those of the "R. C." mine, near Brownsville."

LIVELY TIMES.—*Bulletin*, Oct. 24: Butte county is experiencing a revival of mining. Major A. F. Jones of Oroville, who was in this city yesterday, says there is more activity in mining in Butte than the county has seen at any time for ten years past. This activity is in the direction of quartz and drift mining. So far as the Major knows, there is no movement to reopen any of the gravel mines by the hydraulic process under the Caminetti act, but a number of the old hydraulic mines are likely to be worked by drifting. Among these is the great mine at Cherokee, which has been closed four years. At Bangor and others points in the mountains or hills there is a good deal of mining in progress. There is some prospect of the reopening of the famous Perschbacker gravel mine at Magalia, which, the Major says, is probably the richest gold mine in the world. It is owned by N. D. Rideout.

Mono.

BEAUTIFUL ONYX.—San Francisco *Examiner*. California is always turning up some new resource, and now Mono county comes forward with an onyx discovery and a beautiful exhibit for the Midwinter Fair.

The travertine and onyx discoveries near Bridgeport, Mono county, are attracting much deserved attention, and promise to materialize into a great industry. It is strange that such an inexhaustible, valuable, scarce and most beautiful material for ornamental and building purposes should have so long escaped the eagle eyes of the modern prospector and scientific men who have so often visited this section. Scientific men have pronounced it a "wonderful formation," but none seemed to know that the immense backbone protruding above the Hot Springs basin, Mono county, is a mass of travertine and onyx, of which the former is the only known heavy deposit in this country, all of that material used in the United States being imported from Italy, Rome being built mostly of travertine. The pavement of the vestibule of the Mills Building in this city is Italian travertine. Bridgeport is opening the quarry in Antelope valley and will make a grand and valuable display at the Midwinter Fair, and Monoites will not be ashamed of it. This week a block of travertine was quarried seven by four and a half feet and two feet thick, and weighing about five tons. It will be dressed and polished and shipped to the Fair, where it will attract great attention. There will be also an exhibit of fine blocks of onyx, comprising black, white and variegated, all of which make a beautiful and attractive display.

Nevada.

ST. JOHN MINE.—*Union*, Oct. 21: Some good-looking quartz specimens from the St. John mine were brought into town yesterday afternoon by Superintendent Wheeler. The rock was taken from a crosscut in the 300-foot level, where there is a good-sized ledge. A ledge 12 feet in width, showing well in mineral, has also been encountered in the bottom level of the St. John.

THE CENTENNIAL.—Virginia City *Chronicle*: Secretary James of the Centennial on Monday received a letter from Superintendent Richards stating that he has started another side drift, 1800 feet in from the mouth of the main tunnel. At this point the gravel is much less cemented than in the first side drift, and shows coarser gold. The drift is in about 20 feet and making

good progress, the ground working very favorably. The San Jose mine, adjoining on the south, has a fine deposit of the same gravel, which is paying well. The Centennial tunnel is 2600 feet long. This mine is above Nevada City, California, on the Washington road.

LOOKING WELL.—*Transcript*: The "93" is the name of a gravel mine in the upper part of the county that is owned by Nevada City and Grass Valley parties. Frank and Will Worthington, of this city, are interested in the mine and have been working there for several weeks past. Good prospects have been met with and it is believed that a channel of rich gravel will be found. The mine is located near the line of Towle Bros.' railroad.

THE ORLEANS.—*Union*: Superintendent Geo. L. Thurston of the Orleans mine informs our reporter that the shaft is now down 100 feet and it is proposed to continue sinking until a depth of 250 feet is attained. The hoisting-works building has been completed, and shortly the hoisting and pumping works will be put in place under the efficient management of Joseph Bennallack.

THE GREEN MOUNTAIN MINE.—*Telegraph*: In the Green Mountain mine Superintendent Dan Coflin tells us that there is a ledge in the 300-foot level that surpasses anything he has yet seen underground in that property, and from indications presenting themselves, Mr. Coflin expects in a very few days to strike something far beyond the ordinary. The level at the 300 will soon be started and then drifting to the north and south will he commenced. While the drifting is going on the miners will still continue sinking the shaft.

RICH SHOOT.—*Herald*: It is rumored that a rich shoot has been struck in the Spanish mine, this district. The Nevada City, too, is shipping to the smelter some of the richest ore ever mined at Woods Ravine. The managers do not care to say how rich it is, bot the fignres are high. A new hoisting works is being built at this mine, and the machinery from the lower works will be moved into it, and various surface improvements made.

Plumas.

THE SHENANDOAH.—*National-Bulletin*, Oct. 19: The Shenandoah Mining Company has been erecting several small huildings at the mine in French Ravine—boarding house, blacksmith shop, cabins, etc., and laying in snpplies preparatory to winter. The mill has heen running steadily since it started a few weeks ago, with what results we do not know, bnt inasmuch as the company continnes making improvements, we presume the output of gold is satisfactory. It has been closed down for the winter, however, and from Mr. King, who came out yesterday, we learn that Capt. Smith and he will start to Oakland on Friday, where the Captain has important bnsiness demanding his attention. Fonr men will remain at the mine and continue the extraction of ore dnring the winter. The mine is looking better than for some months past.

NO CHINASA.—*National-Bulletin*: Mr. White, superintendent of the Qoincy Mining and Water Company, informs us that it was the policy of the company to employ no Chinese on the mining enterprise inaugurated by them. At the present time a large force of white labor—men—is employed in all the work connected with the property, including those erecting the sawmill for C. R. Thompson. This means an expenditnre for labor, in round numbers, of $200 per day.

San Diego.

REOPENED.—San Diego *Union*: The stock of the Escondido Gold Mining Company has recently passed into the hands of Los Angeles parties, and, throngh the efforts of W. W. Thomas, who also has an interest, the new owners have heen indnced to commence work on the property. Last Monday evening a party of five miners arrived in Escondido, proceeded to the old Mexican mines southeast of town, and commenced the work of cleaning out one of the shafts. The party is in charge of G. W. Fredericks, who is snperintending the work. It is stated that the new company has purchased 75 per cent of the stock in the company which controlled the mines, and that it has plenty of money to prosecute the work. The new owners state that after an investigation as to the work formerly done in the mines they were satisfied that it would repay all the expenses of operation and leave a good profit for the stockholders, and it was after arriving at these conclnsions that they decided to commence work. At present there is no machinery on the ground, but as soon as the work progresses far enough to require pumps and hoisting machinery they will be forthcoming. The men with Mr. Frederick are all practical miners, and all are of the opinion from indications of the old works that it had paid good money when operated, and have no donht as to the result of the work they have in hand paying after they get the mines opened up.

Tuolumne.

RICH STRIKE.—*Independent*. A wonderfully rich chnte of gold-hearing quartz was struck a few days ago in the old Rawhide mine near Sonora, Tnolumne county. Experts in quartz mining who have examined the vein and the rock taken out estimate that the ore will run very high.

The rich find was made on the 400-foot level of the mine, on what is known in that section as the east vein of the famous mother lode. The chnte opened to a width of eight feet and last week the rich ore had been followed to the depth of 14 feet with prospects of growing richer and wider. The discovery created considerable excitement in and ahont Sonora and many men visited the mine to inspect the ore for themselves. It was apparent to all old miners that the vein wonld yield more gold than any other mine in recent history of the county, and if the prospects are realized the old Rawhide mine will be the greatest gold producer the world hss ever known.

The directors of the Tuolumne Connty Fair association realized the importancs of the great striks and a messenger was hurried to the mine to secure a large sample for exhibition in the pavilion. A piece of quartz ahout three feet long, fourteen inches wide and five or six inches in thickness wss carried to the pavilion and displayed for the amazement of visitors. The rock was literally sprinkled with the precious metal, showing a character that is full of promise to the lucky owners of the mine. The exhibit was carefully guarded and proved to be the most attractive thing in the large pavilion. The day after the fair the big specimen was carried back to the mine and placed on a large dump pile of the precious ore.

An experienced miner who visited the mine last Monday says the lucky owners have in sight fully $150,000 in the rich rock uncovered. It is believed that the vein will increase in richness as the drift is extended and that the find will soon surprise the world of mining men and attract renewed attention to prospecting along the great mother lode. All the rich discoveries along this great quartz formation have been on what is called the east vein. The main body of the mother lode does not carry gold, but there are chutes on either side which yield enormous returns. The new Rawhide vein has all the characteristics of a steady prodncer and being an east vein it is believed to be permanent.

The Rawhide mine was opened in 1860 hy a wealthy eastern company and a valnable mill was huilt to work the ore. The yield of gold was heavy for a long time and the mine was recognized as a very rich one. Finally the vein was worked ont and the mine was closed. A few years later the mill was destroyed. The mine remained closed for npward of 20 years nntil W. A. Nevills of San Francisco reopened it a conple of years ago. He found good milling ore and made a deal with Ballard & Martin of that city to erect a mill. They recently finished a 40-stamp mill on the mine at an expense of $65,000 and thus became the owners of two-thirds of the mine. The mill will be started up this month, when wonderful reports may be expected from the old Rawhide.

Nevills, Ballard & Martin are also working the old App mine at Qoartz mountain near Jamestown. They recently made a very rich strike in that mine, which will warrant the building of a new mill on that old property. These two discoveries have given a new impetus to the qnartz mining industry in Tuolumne county.

NEVADA.

Washoe District.

SUMMARY OF COMSTOCK OPERATIONS.—The only place in the Consolidated California and Virginia mine from which ore was extracted last week was in the south drift from the winze, 52 feet below the 1650-foot level. From this point 18 tons of ore, assaying $28.08 per ton, were taken ont. Most of the work in other parts of the mine is on repairs. The gallows frame (inclnding foundation) at the Con. Virginia shaft has been thoroughly repaired. The expense of this work has been paid in full, amounting to a little over $900. Everything is now in readiness to proceed with the work of making necessary repairs to the shaft between the surface and the 1000 level.

The recently started prospecting work on the 1465 level of the Ophir and Mexican mines continnes, but no important changes in formation have yet occurred. On the 900-foot level of the Union shaft the joint Sierra Nevada and Union north drift from the west drift, 1520 feet west of the shaft, has been advanced 10 feet; total length, 224 feet; face in clay and quartz giving low assays. Wednesday we struck a strong flow of water, since which time have been engaged in cutting a drain and repairing the drift. In the Best & Belcher and Gould & Curry mines the usnal prospecting work is being done, without any changes of importance.

In the Hale & Norcross mine, on the 1300-foot level, they have sunk the winze 5 feet during the week, continning in ore. Total depth of winze, 33 feet. Have extracted 10 cars of ore, assaying, per car sample, $26.40, and 10 cars of ore assaying $15.78 per car sample. In the Chollar mine the north drift, 145 feet north of south line, 100-foot level, is out 138 feet; face is in quartz and porphyry. Eighteen feet back from the face of this drift we have started a crosscnt west, which is now out 20 feet; face in porphyry. They are yet engaged in making repairs to the main incline below the 930 level. In the Potosi mine the north drift is 63 feet below the 1000 level, which is ont 70 feet; face shows 3 feet of fair-grade ore. Extracted and sent to the mill the past week 187 tons 500 pounds of ore from the 1150 level. Milled during the week, 187 tons. On hand at mill, 100 tons and 1200 pounds. Average battery assays, $17.33; average car sample assays, $18.68. At the Ward shaft the west drift from the station, 820 level, is out 250 feet from the shaft; face in porphyry. In the Occidental Con. mine they have extracted from the stopes above the 400 level about 10 tons of ore of the average value, as per car samples, of $38 per ton. The west crosscnt from No. 2 npraise, started at a point 75 feet below the 300 level, is in 71 feet; face in porphyry, with seams of quartz.

Silver City District.

RUNNING FULL BLAST.—Dayton *Times*: The Mt. Bnllion mine, owned hy F. S. Lacronts, is rnnning full blast, and good ore is coming out lively.

Butch Geyer has struck it pretty rich in his mine. He says the "yellow stnff" shows np so thick in all parts of the ledge that he has to get above ground occasionally to keep from going blind.

Lockerman and Collier had a rich clean-up from the ore they sent to the Dazet mill. Some of the ore is said to have been worth $1000 per ton. They are having trouhle over the division, however, and will settle their differences before Justice Walker.

White Horse District.

NEW MILL.—*State Journal*, Oct. 21: The Whits Horse mines near Wadsworth are coming to the front. W. H. A. Pike says Walter Schmidt of White Plains has completed arrangements to bnild a small mill at the mines. He has the machinery, and will commence hauling it to the mines immediately. He says there is ore enongh to run a ten-stamp mill, bot money is scarce and he cannot afford to build snch a mill at present. Mr. Schmidt has had considerable experience in mining. He owned the Rye Patch mines in Hnmboldt county in early days. He is a practical assayer, and fully nnderstands working gold as well as silver ores.

ARIZONA.

DOING WELL.—Prescott *Courier:* John S. Jones' mill, Chaparral gulch, finished, about two weeks ago, a run on Little Jessie ore, on which its stamps have heen dropping since April last. Rich ore continues to be taken from the Little Jessie by F. L. Wright, lessee. The main shaft is now down 165 feet. Quite a force of miners are at work on the claim. Mr. Jones has finished a shaft honse and will place hoisting machinery in it as it arrives, and proceed to sink a deep working shaft. This mine has produced many thousands of dollars the past year, and as development work progresses holds out as well in richness and size as at first. The ledge is strong and well defined. The ore plates on an average about $50 per ton, and concentrates abont 100 ponnds the ton; concentrates rnn $200 per ton.

GOLD FAVORED.—*Journal-Miner*, Oct. 18: D. P. Nichols, the well-known miner and farmer of Skull valley, says that either the hard times or the low price of silver has made his section a favored one with gold-hunters, there being at present over 40 men in the foothills east of the valley engaged in placer mining with dry washers. These old-time fields have produced thousands of dollars in placer gold, and being easy of access and as the pay dirt lies but a few inches from the surface, less labor and expense is met with than is usual in this character of mining. He says in two days he cleaned up an ounce of fine gold, while from the other camps in the district miners are making from $3 to $7 per day.

A PRACTICAL MAN.—Prescott *Courier*: A four or five days' sojonrn among the mines of Big Bng convinces your correspondent of the trnth of what has so often been claimed, namely, that when pnt under the management of practical men many of the mines in this locality, now considered too low grade, will he added to the dividend list. As an example of what a man of experience can do, Mr. J. R. Ritchie, who has for months heen running on the low-grade ore of the Old Bullion, may be cited. Paying a 10 per cent royalty for the lease of the mine, hanling the ore two miles over a steep mountain road to a five-stamp mill, for which he must pay $50 per month rent, paying his help the top wages, this generous, nnassuming, thoroughly practical man has succeeded in extracting a good margin of profit from an ore that would for others before him not pay expenses of mining and milling.

MOHAVE NOTES.—Kingman *Miner:* The White Hills Company will soon erect a five-stamp silver mill on the G. A. R. mine.

A number of men are working on the mines in Minnesota and Weaver districts, and some of them are taking out nice little stakes.

This part of Arizona will receive a great deal of attention dnring the year 1894 in the matter of irrigation schemes and the working of mines with electric plants.

More mills are necessary for the working of ores in Mohave county.

There are 16 leasers working on the Norma mine, at White Hills, nearly all of whom are doing well. G. C. Blaine has the best showing, and has taken out more rich ore than any other man in White Hills.

A new csmp has been opened up 35 miles west of El Dorado Canyon, and the mines are heing worked by several companies. A claim was sold there for $8000 one day last week, and several more sales are on the tapis.

There is a project on foot to start np the Todd Basin mill. This mill, in good hands, could he made to pay a hig profit to the owners. There is plenty of good ore in the vicinity of the mill that can he worked profitably, hut is considered too low grade to ship to the smelters.

All damage done hy the hig flood at El Dorado Canyon has been repaired, and now the mill of the Southwestern Mining Company is ponnding away on good ore. The Canyon has been one of the hest producing camps on the Pacific Coast, and will undoubtedly he prodncing hullion when more recent camps have passed in their checks.

A number of Pennsylvania companies are looking over the country with a view to investing in some of our gold mines.

The rock work on the Nevada Southern railroad, near Vanderbilt, is being pushed as fast as possible, hut it will be some months before Dry Lake valley is reached.

Work on the Nighthawk mine is developing as rich a body of ore as has ever before been uncovered in that property. Gaddis & Co. are the lucky lessees of this mine.

Jackson, Mix Bros. and Cleve are delving in the Old Grey Eagle, in Wallapai mountain, and are extracting some rich silver ore. They have a fine prospect and will soon commence shipments to the sampler with the regularity of clockwork.

The ten-stamp mill recently erected in Yellow Pine district, to work the Keystone ores, has been ponnding away for some weeke. Returns from the first bars of bullion were recsived hy the Needles National Bank Thursday from the Denver mint. The bnllion was nearly 1000 fine.

The Keystone is said to be a valuable property and is owned by I. E. Blake and W. S. Godbie.

An average of 91 sample assays made at the Kingman sampler gave an average of over $500 per ton in gold and silver. The greater number of the samples were the basis of settlements of ore purchases.

By Collins and Ton Stinson are working the stopes of the Blackfoot mine, sitnated between Todd Basin and Stockton Hill, and are getting splendid copper ore. This ore carries from $100 to $1000 in gold per ton. They have a nice block of ground to cnt out and will get many carloads of ore before they strike grass roots. They have let out some of their surface ground and the lessees are getting good ore.

OREGON.

MINE SOLD.—Ashland *Tidings*, Oct. 20: The Ophir mine near Ashland, owned by McCarthy, Beswick, Martin, Roper and others, has been sold to a Mr. Lawrence, cousin of the mayor of Brooklyn, N. Y., for $1500, cash sale, money to be paid in 30 days. The Ophir has two prospect tnnnels in it, and some fine prospects have been strnck. It is near the Golden Fleece, upon which the Huntington mill is to be put up immediately, and is supposed to be a similar formation. Mr. Lawrence started for New York last week, and is expected back soon.

Another quartz mill will begin its musical hum in this neighborhood soon. Dr. W. H. Flanagan of Grant's Pass has taken an interest with Hill & Shannon in the Golden Fleece mine, north of town, and is moving his Hontington mill to the mine, which has been operated on Williams creek, in Josephine county. The Golden Fleece is a claim on E. K. Anderson's land, crossing the upper end of the old McCall & Anderson gravel mines, which have been worked by hydraulic pressnre for many years. Mr. Hill, who is an experienced miner, became convinced that this placer mine was fed by a mineralized dyke or ledge near at hand, and in his prospecting fonnd the sonrce of the gold to be an extensive body of ore which had been cnt into at the upper end of the gravel mine. He and R. T. Shannon secured a hond or long-time lease of the gronnd from E. K. Anderson, and have been actively at work prospecting it doring the past few months. Different parties have examined the nroperty with a view to putting a mill upon it; but, as the formation is pecnliar and unlike what most of them have been familiar with, they hesitated until Hill & Shannon grew tired of waiting and began negotiations with Dr. Flanagan. Some 30 sacks of the ore were carted over to Williams creek and tested in the Flanagan mill, and the result was so satisfactory that it was determined to move the mill to the mine at once. It is being transported now by wagons, and will be put at work jnst as soon as the necessary bnildings and accessories can be constrncted. Mr. Hill not half a dozen men at work last Monday, fixing the wagon-roads and bridges across the gulches. The power is to be supplied hy a 20-foot overshot wheel (20-horse power) which I. O. Miller is now making. The mill—a Hnntington rotary—works np about 1½ tons of the ore per hour, and sconrs the gold so that much of it which would be lost in the hydraulic operations by failure to amalgamate will be saved on the plates. The battery is also supplemented with a first-class concentrator, and very little gold will get through to the tailings. Mr. Hill calls the ore deposit a boil between walls. The walls are a long distance apart, bnt he helieves it is a genuine fissure and that the mine will be a deep one. However that may he, there is a vast body of ore on the surface. It can he worked for about $1 a ton, and, if it yields as the prospects indicate, the miners will have a bonanza.

W. L. McClnre and W. T. Shaffer were in town last Monday from Gold Hill, and a few mining items of interest were obtained from them. Joe Cox, who was with Lucky Bart in the discovery of the mine sold to Lindley, has made another rich discovery on Sardine or Murphy creek which he thinks will be a good thing. Lindley's mill is running steadily at the Lncky Bart mine, and everything is reported favorable there. At the Hammersly mine, at the head of Jump-off-Joe, the mill is disahled, but the mine is opening out handsomely—ledge getting bigger as they go down, and as rich as ever.

S. D. Taylor came over a few days ago from his mine at the head of Hongry creek, and reports everything looking hright at the mine. Staples & Van Vactor's new five-stamp mill, not far from his mine, runs like clock-work and gives encouragement to prospecting in that region.

H. C. Dollarhide and Harvey Roach continue work at their coal mine in the Siskiyous, and with constant enconragement at the improvement of the prospect as their work progresses. They have found a good lignite coal, and believe that a tunnel which they are now rnnning will strike a vein of sufficient thickness to pay well for working. Their mine is within three miles of the railroad and within 300 yards of a wsgon-road.

COW CREEK MINES.—Jacksonville *Times*: C. S. Goodnow, of Cow creek, an old miner, started up his hydraulic works on the 20th of September. He thinks that he will clean np $5 worth of gold per hour when his works are in full operation. He has a hlne-gravel lead snch as is pecnliar to Califorvia, and snch leads are considered hy old miners to give the hest results from work performed.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 26, 1893.

The imminence of the repeal of the Sherman silver purchase law has had the effect of depressing the New York silver market, though the London market has remained practically unchanged during the week. The effect in this country, however, has been by no means what might have been anticipated, in view of the recent history of the market. When the Indian Government suspended purchases, the effect was instantaneous, and a drop of 20 cents per ounce occurred. The market subsequently partially recovered, but now, when it seems certain that this Government will likewise totally cease purchases, the result is a drop of less than one cent. The reason doubtless lies in a feeling of confidence, more or less well founded, that remedial legislation will follow repeal of the Sherman Act, and that the United States will soon again be a silver customer.

The really notable feature of the week has been the drop in lead. The New York quotation was yesterday 3.2 cents per pound, which is very nearest the lowest recorded—3 cents in 1879. The partial resumption of the silver-lead mines, the size of stocks on hand, and general business prostration, seem to be the leading causes.

Copper is dull and low.

Treasury Purchases of Silver.

A statement prepared at the Mint Bureau of the treasury shows that during the first quarter of the present fiscal year the Treasury Department, acting under authority of the Sherman Silver Act, purchased 8,923,108 fine ounces of silver at a cost of $6,479,003, and treasury notes to that amount were issued against the silver so purchased. In detail the purchases were:

Month—	Fine Ounces.	Cost.
July	2,218,982	$1,583,230
August	3,934,497	2,907,344
September	2,769,629	1,988,429

"If the full amount of 4,500,000 ounces had been purchased each month," says the *American Banker* of New York, "the silver purchase for the first quarter of the present fiscal year would have been 13,500,000 ounces which, at an average of 74 cents per ounce, would have made the treasury notes issued against the purchases foot up $9,990,000."

Silver Sales Light.

The total offerings of silver to the Government for the past half of the month were only 1,820,000 ounces. The total includes some lots that were offered two or more times. Silver was offered on six days during that period. On each occasion the proposals were declined, because above the London parity, and counter offers made for the whole quantity representing that parity. As the result of these counter offers, 666,000 ounces were secured at an average of 73½c per ounce. If the purchases for the last half of the month are not on a more liberal scale, the quantity secured will be under 1,500,000 ounces, against 4,500,000 authorized by law.

Silver and the Metals.

NEW YORK, Oct. 26.—Following are the closing prices for the week:

Mining Share Market.

SAN FRANCISCO, Oct. 26, 1893.

The Comstock market experienced something like a boom during the latter part of last week and Monday of the present. On the latter date the Board rooms and their approaches were crowded with interested people, and a total of fully 50,000 shares of all stocks changed hands at both exchanges during the forenoon. The leading stocks of the present speculation—Consolidated California and Virginia, Best & Belcher, Ophir, etc.—not only had a strong advance, but all the other Comstocks were higher. It really looked like old times on Pine street. After awhile the market receded a little under the liberal sales of traders who had profits in sight or who wished to sell short.

At the Pacific Board the crowd was so great it was hard to get in. The brokers had as much business as they could attend to, and the Comstocks opened with great activity and stronger prices. At the 9:30 A. M. session of the San Francisco Board the sales amounted to nearly 18,000 shares and were the largest of any session for over six months past. Ophir touched $1.60, Con. California & Virginia $3, Best & Belcher $1.50, and all the other stocks along the line moved up strongly in sympathy.

At the second session of the San Francisco Board the market continued very active. Prices had a small decline along the line. At the close $2.70 was bid for Con. California & Virginia and $2.75 asked.

On succeeding days there was strong pressure to sell and prices went back to about where they were a week ago.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INSULATING JOINT.—No. 506,034. Dated Oct. 3, 1893. Samuel W. Burtchaell of San Francisco, Cal. This joint is for connecting gas fixtures with house pipes in such manner that the proper insulation will be made for the attachment to the fixture of electric lighting apparatus. The improvement in the joint lies in its being non-rotatory, to which end the several parts interlock in a novel manner.

CAR COUPLING.—Joseph McDonogh. No. 506,528. Dated Oct. 10, 1893. This invention relates to safety appliances for coupling cars and it consists of a device by which the coupling link may be presented so as to enter the opening in the draw bar without danger to the operator. The coupling pin has a chain by which it is connected with an arm projecting from a horizontal shaft which is journaled upon the end of the car, and has a crank arm within easy reach from the outside, so that by turning the crank the pin may be let down, or withdrawn. Connected with this shaft are locking bars, by which it may be locked in any desired position to retain the pin in an elevated position, or to prevent its coming out when the cars are coupled.

CASH REGISTER AND INDICATOR.—Fred W. Vanghn, S. F., assignor of one-half to John D. Sibley of same place. No. 506,891. Dated Oct. 17, 1893. The object of this invention is to provide a cash register which, while exhibiting to the customer the amount of his purchase as in ordinary cases, also makes provision for the indication to the operator of a progressive amount or sum total, representing the entire amount of sales for any given time, the arrangement of the parts being such as to enable them to be manipulated easily and readily and at the same time preventing any tampering with the machine, by which its proper function and operation may possibly be perverted.

TRAVELING BALING PRESS.—John Wiebe, S. F. No. 506,892. Dated Oct. 17, 1893. The object of this device is to take up the hay as the machine is being drawn over the field and to deliver it to the baling portion of the implement, wherein it is pressed by the draft of the horses in moving the machine. It consists of a wheeled frame having means for taking up the hay, a baling chamber to which the hay is delivered, and means operated by the transference of the draft of the horses for actuating the follower of the baling chamber.

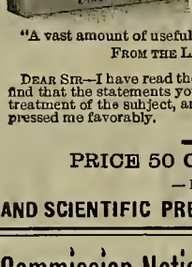
ABC OF ELECTRICITY

By WILLIAM H. MEADOWCROFT

Endorsed by THOS. A. EDISON.



WHAT THE PRESS SAYS.

"A clear and comprehensive little treatise."—*N. Y. Sun.*

"Electric Science is making magnificent strides and this book fills a useful office in setting forth the features and characters of these advances."—*Brooklyn Times.*

"The need of such a book has undoubtedly been felt by many . . . we predict for it a splendid sale."—*The Age of Steel.*

"A book like this should be largely read."—*N. Y. Herald.*

"The book is well illustrated, and no pains have been spared to make it accurate and reliable throughout."—*Electrical Review.*

"In simple language, the author lays bare the secrets of electrical science and application."—*Electrical World.*

"A vast amount of useful importance."—*Washington Post.*

FROM THE LABORATORY OF THOS. A. EDISON,
ORANGE, N. J., Sept., 24, 1888.

DEAR SIR—I have read the MS. of your "A B C of Electricity," and find that the statements you have made therein are correct. Your treatment of the subject, and arrangement of the matter, have impressed me favorably. Yours truly,

THOS. A. EDISON.

PRICE 50 CENTS, POST PAID.

Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, having received petitions to mine by the hydraulic process from Westall and Hughes, in the New York mine in Sierra county, to deposit tailings behind a dam in Howard creek; from Corbiere and Bean, near Clipper Mills, Yuba county, to deposit tailings behind a dam in Hampshire creek; from W. A. and M. E. Schofield, in the Phoenix mine, near Hepsidam, Sierra county, to deposit tailings behind dams in Whisky creek and the North Fork of Slate creek; from the Craycroft Mining Company, in the Craycroft Hill mine, near Downieville, Sierra county, to deposit tailings behind dams in Davidson ravine; from the Excelsior Mining Company, in the Excelsior hydraulic mine, near Downieville, Sierra county, to deposit tailings in and near Eagle ravine; from the Eureka Mining Company, in the Eureka mining claim, near Downieville, Sierra county, to deposit tailings behind dams in Kanaka and Sawmill ravines, and from the Quincy Mining and Water Company, in the Bean Hill, Jack's Hill, Mountain House, Gopher Hill and Shore's Hill claims, near Spanish Ranch, Plumas county, to deposit tailings in old hydraulic pits and behind dams in Maurer ravine, Spanish creek and Green flat, gives notice to all concerned that a hearing will be held at the office of the Commission, Room 92, Flood Building, San Francisco, on November 7, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary of the Commission.

WANTED—A PARTNER

TO TAKE OUT PATENTS IN FOREIGN COUNTRIES on Endless Self-Laying Tracks for Vehicles and Trains. A. P. ANDERSON, Oriental, Nev.

$1000 WORTH OF LAW

FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save many times, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

Address THE DEWEY PUBLISHING CO.,

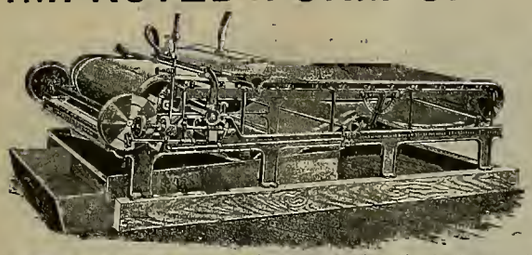
SEND FOR ILLUSTRATED CATALOGUE.

IMPROVED FORM OF "TRIUMPH" ORE CONCENTRATORS.



The annexed cut illustrates the "TRIUMPH" CONCENTRATORS, and shows the recent improvements which have been introduced into their construction, by which many advantages are gained over any other form of Vanners, Vanning Machines or Concentrators.

These advantages are obtained by reason of the fact, as will be observed, that the crank-shaft is now placed and fitted at the head of the Concentrator, clear of the belt and in direct view of the operator or attendant. This, of course, greatly facilitates the oiling of the bearings of the shaft and connecting rod and precludes the possibility of any sand or detritus, passing over the belt, from reaching or getting into the bearings.

The forms of the bearings and as well of the connecting-rod brassee have also been very much improved, making them stronger, simpler and more easy of adjustment. Important changes have also been made in the feed screw and quadrant for regulating the belt, with the view of making all parts of the machine stronger, more accessible and as easy of regulation as is possible.

We furnish the "TRIUMPH" Concentrators with either the plain or "Blasdel" Riffled Belt and shall be pleased to quote prices with the adaptation of either, as may be requested, and shall further be pleased to show one of the improved form, set up ready for operation, at our office.

REDDING, CAL., April 22, 1893.

Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco, Cal.—Gentlemen:—Following the testimonial letter which I addressed to you December 9th, 1890, in relation to the superiority of the "Triumph" Concentratore over either the "Frue" Vanners or "Woodbury" Concentrators for concentrating our Texas ores, I hold now to the opinion then expreseed; and with nearly two yeare and a half further experience in their operation I can confidently assert and am more fully convinced than then, that the "Triumph" Concentrators are better in all reepects than any other form for concentrating our Texas and Bully Choop ores, and in evidence of such confidence I refer with pleasure to the order recently placed with you for four (4) of the "IMPROVED TRIUMPHS," to make up the complement required for use in the new twenty (20) stamp mill at the "Cleveland Conolidated Mining Co.'s mines in Bully Choop Mining Dietriot in Shasta and Trinity Counties, this State, and I feel assured that the improvements lately introduced into their construction will make them even better than the old form which I have had in operation for so many years past in the different mills under my supervsion. I am, very truly,

(Signed) R. G. HART, Sr., Manager Texas and Cleveland Cons. Mining Co's.

Portable Elevator Screen and Conveyor.

The accompanying illustration represents a practical and efficient machine for the handling of sand and gravel, manufactured by the Jeffrey Manufacturing Company, at Columbus, Ohio. The machine is designed to dig sand and gravel from the bank and then separate it and deposit it in separate cars. The capacity of this machine is about 40 cars per day of ten hours, making it possible to load 30 cars of sand to 10 of gravel, this depending largely upon the per cent of sand in the bank.

The machine is very substantially constructed, and can be built for larger or smaller capacities. The lower timber work is mounted on truck wheels to suit standard railroad gauge. On this truck is placed a circular gear rack engaging with a gear pinion which is fastened to an upright shaft on the upper frame work. Castor wheels and center plates are placed between the upper and lower frame work for the purpose of revolving the entire upper part of the machine on the lower frame work in a complete circular movement, thus enabling the operator to reach the bank from either side of track.

The elevator is constructed of Jeffrey special steel chain, being double strand, to which suitable buckets are attached. The buckets are made of heavy sheet steel handed on top edge, with teeth riveted to front lip for the purpose of digging the material from the bank. This elevator is mounted on a wrought iron angle ladder frame which is allowed to swing from the upper or delivery end of elevator by means of two wire cables fastened to lower end of ladder and passing over sheave wheels at end of jib timbers and down on to two spools on frame work.

By means of crank and gearing the elevator is raised up on to the bank and then is allowed to work its way down to a line even with the track.

The sand and gravel are elevated and discharged upon a shaking screen, the mesh of which can be made to suit the grade of sand desired, the gravel passing off over the screen on to a rubber belt conveyor into car, the sand passing through the screen to chute below and into the car. If it is desired at any time to work the elevator at an angle with the track, the shaking screen, chute and conveyor are arranged to swing at an angle, in order to keep them about square with the cars. Further particulars can be obtained of the makers.

PORTABLE ELEVATOR SCREEN AND CONVEYOR.

In this issue is contained an admirable review of the causes that have conspired to fill up the Sacramento and tributary streams, and of the obligations of the Government to erect restraining works at the outlets of unnavigable streams. The author is Hon. Tirey L. Ford, State Senator, framer of the Ford mining law and the State Debris Commission law, and chairman of the legislative committee of the State Miners' Association. Mr. Ford points out clearly that hydraulic mining has contributed only a small part of the detritus which has poured down from the mountains and filled up the rivers; and that construction of restraining dams is solely for the purpose of protecting navigable streams and therefore in strict accord with public policy. Any benefit to the farmer, to the miner, or to other private interests, is incidental. Mr. Ford's statement of the situation and of the Government's duty is complete and logical, and his argument is incontrovertible.

The falling price of lead has again affected the Cœur d'Alene mines, and it is questionable what will be the result, if there is no improvement in the early future. The Bunker Hill & Sullivan at Wardner, which started operations recently, has curtailed expenses in every possible manner, and for the present the night shift has been dispensed with. The statistical situation in lead gives promise of better prices, and it is to be hoped that an advance will soon occur.

What is seigniorage? is often asked. Seigniorage represents the difference between the actual cost of a metal and the making of it into money, including alloy, wastage, etc., and the nominal sum for which the coin thus made is paid out by the Government. For instance, if the Government makes a silver dollar at an expense of only 60 cents, the Government has made an apparent profit of 40 cents on each $1, this profit being seigniorage. There are fixed charges at the mint in making all coins. These include the cost of alloy and for refining and making the coin from the prepared metal. These fixed charges are added to the actual cost of the metal, and the difference between this sum and the nominal value at which the coin is passed by the Government represents the seigniorage or Government profit.

The Georgetown (El Dorado county) *Gazette* severely criticizes the figures recently compiled by Mr. Chas. G. Yale as to the California output of small and Chinese mines, and claims that "gross injustice has been done to El Dorado county as a gold producer." The *Gazette* complains that the output of the Taylor 40-stamp mill alone exceeds the amount given as the total gold product of the county, $198,321. The *Gazette* appears to misunderstand the situation. These statistics prepared by Mr. Yale represent only the product of small and Chinese mines, and exclude all large mines. They were taken from the records of the Government and not, therefore, from original sources. He is not responsible for the statement that the total El Dorado output is only $198,321. Other newspapers besides the *Gazette* have fallen into the same error and have given the Government estimate of $12,571,000 for the output of California in 1892 as Mr. Yale's. That gentleman became Government Statistician as late as August, 1893. The county totals used by him were first published in the volume of the director of the mint for "Production of Gold and Silver for 1892."

An effort has recently been made to secure the removal of the California Wire Works from this city to the East, representations being made to the owners that they would there be nearer a large and growing market, and therefore in better position to enlarge their business than in San Francisco. The removal of the plant would be a distinct loss to the manufacturing enterprises of this city. Employment is given at the works to 150 men, and, directly and indirectly, thousands of dollars are added to the business of the community by their operation. It is noteworthy that during the recent stagnation of business the works have been in full and active operation in the rope works, ropeway and wire mill departments. Large Eastern orders have required the concern to give employment to a full complement of workmen. It is therefore gratifying to know that removal is not contemplated by the wire-works people. They have secured much Eastern business by turning out a superior product, and they expect a continuance of such methods in the future as in the past.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 303.

THE electrical display at the forthcoming Midwinter Fair is expected to show the development of that branch of invention in a very complete manner. It is stated that electrical concerns from both Europe and America have applied for space to exhibit their various appliances and the Western Electric Company has just been awarded the contract for furnishing light upon the proposed electric tower. It is this company that designed the Pompeiian electrical room at the Chicago Fair, the great electrical wheel with its 850 changes, the marvelous imitation of a stroke of lightning, and many other strangely beautiful sights. The electrical machinery will be placed in the Palace of Mechanical Arts. There will be electric motors and batteries, illustrations of lighting and heating by electricity, and exemplifications of electro-metallurgy and electro-chemistry. There will also be among the electric exhibits complete systems of intricate electric signals and of the application of electricity in every conceivable way. Phonographs will also have a place here, and one of the interesting features will be representations of the use of electricity in surgery and dentistry. Altogether visitors at the fair who have not been at Chicago may prepare to see everything in the electric line short of a Sing Sing electrocution.

A NEW ENGLISH AMALGAMATOR is being introduced in Colorado. As described, the machine employs a system of forcing the pulp through the quick. The apparatus consists mainly of a casing with inlet and outlet ways which lead into and from a lower and upper chamber, said chambers being separated from each other by a plate, but communicating with a central space common to both. At the bottom of the central space is the mercury stratum, space, or well. The entering of the pulp by ports leading under the mercury stratum to the central space and the reversed flow of the tailings through tangentially arranged curved wings and ports of a dividing wall in the upper chamber to the outlet way is easily understood by giving a little attention to the matter. Electricity is employed with the mercury in the treatment of refractory ores.

THE transactions of the Technical Society of the Pacific Coast for October contain a paper on "County Road Construction," by Julius H. Striedinger and Otto Von Geldern, read October 6, 1893, and prepared for the State Road Convention recently held at Sacramento. The notes are compiled from Nessenius, a leading European authority, with revision and additions adapted to road-building practice in California, such as suggest themselves to engineers of the ability and experience of the authors. A new chapter on dirt roads is introduced, under the belief that macadamized and gravel roads are best adapted in point of economy for our more important county roads, and that such improved and well-kept highways will be most commonly used for some time to come. It is a valuable publication.

The Assessment Work Bill.

Reports from Washington as to the status of the bill suspending the period of assessment work on unpatented mining claims are conflicting. There is, besides, much doubt as to the exact provisions of the bill, the text of which has not been received. The measure was presented by Representative Bell, of Colorado, and was first stated and understood to provide that the assessment year should end September 30th of each year, instead of December 31st as at present, and virtually that the year of 1893 should be extended to September 30, 1894. Late reports, however, say that the Bell bill really provides only for the suspension of the present statute for one year, and that the bill will probably pass with a proviso excepting South Dakota from its operations. This is in consequence of the hostility of Black Hills miners to the measure.

It is impossible to discuss the measure intelligently while its provisions are in doubt. The California miners are not united on the subject, though the late Miners' Convention placed itself on record as opposed to any change in this respect of section 2324 of the Revised Federal Statutes. That is to say, the miners declared themselves opposed to the Stewart bill, which proposed to make the assessment year begin October 1st instead of January 1st. No serious differences exist amongst the miners as to the inadvisability of the change; but there is more or less objection to the suspension of work for one year. It comes mostly from working miners, who are accustomed to perform labor on claims for non-resident owners and who will seriously miss any intermission of the annual $100.

The PRESS expects very soon to be in possession of the text of the Bell bill and its provisions will then be given in full.

LATER (Thursday).—The following press dispatch from Washington, under date of November 1st, explains the present status of the bill:

At 3 o'clock Chairman Weadock of the House Mining Committee called up the bill suspending for one year the performance of assessment work on unpatented mining claims, which has been in conference for several days.

The conferrees yesterday agreed on the bill, but excepted South Dakota from its operations in lieu of Senator Pettigrew's amendment which limited the benefits of the act to actual residents of the State or Territory in which a claim was situated.

Representative Pence, in a five-minute speech, explained the objects of the bill. He said that by the action of the Administration 10,000 miners in Colorado alone would be compelled to leave their mining claims and seek other means of earning a living for the coming winter, and that this measure, by relieving them of the necessity of performing their assessment work this year, would give them an opportunity to engage in other pursuits.

Representative Hartman of Montana also spoke in favor of the bill.

Representative Lucas of South Dakota briefly explained why South Dakota was excepted. He said that conditions in his State were different from those in other mining States. The suspension of assessment work would be of little benefit to miners, but would relieve a vast number of wealthy corporations from this obligation.

Ray of New York then took the floor and strongly opposed the clause in the bill excepting South Dakota. He considered it a great injustice to the owners of mining claims in New York, a good many of whom resided in his district. In spite of Ray's strong protest a viva voce vote disclosed a large majority in favor of the adoption of the conferrees' report. Ray demand a call for a quorum. A roll-call showed the presence of a quorum, and the report was adopted.

The bill now only needs the President's signature to become a law.

THE production of the Rand for September showed a falling off from the previous month, due, it is said, to the scarcity of native labor. The record for 1893 is as follows:

	Ounces.
January	108,374
February	93,252
March	111,474
April	112,053
May	116,911
June	122,907
July	126,169
August	136,069
September	129,585

The record for the past seven years has been as follows:

	Ozs.		Ozs.
1887	23,155	1891	729,237
1888	208,121	1892	1,210,868
1889	369,557	1893 (partial)	1,056,794
1890	494,817		

The total output of the Rand to date is 3,857,482 ounces, or about $75,000,000. California has produced altogether $1,300,000,000. It will thus be seen that South Africa will have to do a great deal of very hard hustling before it makes good its boast that it is going to beat the California record.

CONGRESSMAN NEWLANDS, of Nevada, is of opinion that after the Sherman law is repealed the administration will favor a measure that will retire all the present one, two, five and ten dollar currency notes and substitute silver in their place by coining the bullion now stacked up in the treasury. The design will be to educate the people of the East to the use of silver money, and in that way perhaps bring about a more friendly feeling for the white metal. The prejudice of Eastern people against the use of metal money, and their preference for notes, arises largely out of tradition and custom. There are the best of reasons why they should use metal money, and it is hoped and believed that this desirable end will finally be accomplished.

Silver Purchases Stopped.

The repeal bill is now a law, and the Government has totally suspended its purchases of silver. The power of the administration and the clamor of banking and financial circles for repeal finally broke the spirit of the minority in the Senate. The final vote was reached there Tuesday. The amended bill was on Wednesday rushed through the House with indecent haste and immediately signed by the President.

It is too soon to state what the effect of repeal will have on silver. The market has declined, but not as seriously as might have been expected. The effect of repeal seems to have been largely anticipated, and the hope of favorable subsequent legislation has checked any very heavy slump. The administration will doubtless seek to control any bill that may be presented hereafter in the interest of silver; but it has yet given no sufficient indication of what it wants. It is said that the retirement of all paper money under $10 will be sought, and the use of metal money substituted. Bills are the sole media of exchange in the East, but there is no good reason why the silver should not be substituted. Remedial legislation of this kind will be inadequate to restore silver to its place as a money metal, but it is something to have the entire United States accustomed to the sight and use of silver.

The bill as passed by the House and Senate, and signed by the President, is as follows:

Be it enacted, etc., That so much of the act, approved July 14, 1890, entitled "An act directing the purchase of silver bullion and issue of treasury notes thereon, and for other purposes," as directs the Secretary of the Treasury to purchase, from time to time, silver bullion to the aggregate amount of 4,500,000 ounces, or so much thereof as may be offered, in each month, at the market price thereof, not exceeding $1 for 371.25 grains of pure silver, and to issue in payment for such purchases treasury notes of the United States, be and the same is hereby repealed. And it is hereby declared to be the policy of the United States to continue the use of both gold and silver as standard money, and to coin both gold and silver into money of equal intrinsic and unchangeable value, such equality to be secured through international agreement, or by such safeguards of legislation as will secure the maintenance of the parity in value of the coins of the two metals, and the equal power of every dollar at all times in the markets and in the payment of debts. And it is hereby further declared that the efforts of the Government should be steadily directed to the establishment of such a safe system of bimetallism as will maintain at all times the equal power of every dollar coined or issued by the United States in the markets and in the payment of debts.

Foundry Notes.

THE California Wire Works have just forwarded to St. Louis the second of an order for 14 wire ropes placed with them several weeks since. The weight was 40 tons (79,283 pounds), length 28,300 feet, diameter 1¼ inches, and 40 horses were needed to haul the great load to the railroad freight yards, where the rope was forwarded to St. Louis via the Atchison, Topeka & Santa Fe. Two more ropes are ready for shipment and will shortly be sent on. Of the remaining ten, one will be the largest ever turned out by the California Wire Works, and, therefore, the longest and heaviest in the world. It will be 31,500 feet long, 1 5-16 inches in diameter, and will weigh 103,000 pounds. This will exceed by 3000 feet the longest cables previously turned out by the works, and by nearly 8000 feet the record-breaker recently manufactured in England. The California Wire Works have been awarded the medal for wire rope and cables at the World's Fair. The exhibit of A. S. Hallidie secured three medals, one each for ropeway, grip pulley, and cable railway. Mr. Hallidie has donated his historical cable-railway exhibit to the new Columbian museum at Chicago, where it will be displayed permanently in connection with other interesting exhibits from the World's Fair and elsewhere. The chief feature of this collection, it will be remembered, is the original car and dummy used by Mr. Hallidie on Clay street in 1873, and presented to him by the Ferries & Cliff House Railway Company (successor of the Clay street line).

THE Parke & Lacy Company have recently furnished a ropeway 15,000 feet between centers for the Compania Minera de San Andreas de la Sierra of Durango, Mexico. It is to be used for the conveyance of charcoal and wood, and, having a very severe grade, will be operated solely by gravity. The length of the ropeway is notable. With the same shipment were forwarded two hoisting engines, boilers (75-horse power) with feed pumps, pumps for mine, Ingersoll-Sergeant piston inlet compressor, Ingersoll drills, etc. Among other mining appliances recently furnished by this firm is a Dodge pulverizing plant to the Arkansas & San Antonio Mining Co., of Kingman, Arizona, and another to the Porfirio Diaz Gold and Silver Mining Company of Sonora, Mexico.

THE Union Iron Works have just shipped a five-stamp mill with iron frame, engine, etc., to the Drew Mining Company, Woodville, Oregon.

THE status of ownership of an unpatented mining claim is that the holder has simply a possessory right, which does not confer title, but entitles a person who has made and marked his discovery and performed and kept up the work necessary to a valid and subsisting location, for the purpose of developing the mine, to the exclusive possession and enjoyment thereof against the whole world. As this right of possession entitles the party to work the mine, take out its ore and appropriate it to his own uses and profit, it is a valuable right and accorded full protection by the law.

River Protection and Hydraulic Mining.

By Senator Tirey L. Ford of Sierra County.

I have heen freqnently asked what interest the general Government has in the construction of works for the restraining of mountain dehris, and what duty rests upon the general Government in that behalf. As a partial answer to tbese questions, the following is submitted:

It goes without saying that the navigahle streams of California must he protected. It is also true that commerce needs the millions of gold now locked up in the hydraulic grâvel beds in the Sierra Nevada mountains. These desirable objects can both he readily attained through the proper application of engineering skill, and at a cost that need he bnt trifling when compared with the transcendent value of the results to he accomplished.

In order to better appreciate the character of means necessary to accomplish these dsirable ends, it is well to understand something of the canses that have led to the present condition of affairs.

It is a well known geological fact that the Sacramento valley was once a vast inland sea, and that when an outlet was made for its waters through the Golden Gate, its bed was left covered to an immense depth with the accumulated sediment of prehistoric centuries. The vast watershed of the surrounding monntain ranges continued to pour its annnal volume of water into the new-created valley and a central channel or river hed was the necessary and natural result. Thus came into existence the Sacramento river and its numerous trihutaries. Then began that peculiar geological process from which resulted the strange anomaly of a river followiug the einuosities of the elevated rather than the depressed portions of a great valley. The cause for this seemingly unnatural condition of aflairs is quite apparent and easy to understand. From deep canyons and mountain gorges, from sloping hillsides and sheltered vales, there came annually vast quantities of earth and detritus ponring into the river channels; and, as the heavy rains of spring joined the rushing waters from the melting snow, the swollen rivers were unahle to csrry their tremendous burdens, and, as a result, the earth and detritus brought down from the higher altitndes overflowed into the adjoining country where the same were deposited. Thus the banks of the Sacramento river and the adjacent land were gradually raised, year hy year, through the deposits thns annually spread over them, with, of course, a corresponding elevation of the river bed from like deposits, until to-day the Sacramento river is virtually the center of a ridge meandering through the Sacramento valley.

Such was the condition of aflairs when civilization, in its westward march, crossed the mountain barriers that guard this empire of the Pacific. Then the causes which had led to the gradual filling up of the river channel, and the corresponding elevation of the river banks and adjacent land, were suddenly multiplied. Among these additional causss may be mentioned the following:

The most potent factor added by man consisted in the construction of artificial hanks or levees along the river channels. Prior to the building of levees the overcharged rivers found relief through numerous sloughs and natural outlets that aided in keeping the dehris-ladened waters within the confines of the river channel proper. When the rains of spring, however, hrought down the melting snows from the mountains, the rushing waters, with their hurden of accumnlated dehris, overflowed and spread out over the adjacent country, carrying with them the larger part of such accumulations and leaving a smaller part only in the river channels. Thus, while the river hed was gradually filled and raised, the hanks of the adjacent lands were receiving their quota of sedimentary accretions, and were keeping company with the river hed in its gradual elevation. The levees put a stop to all this. By cntting off all means of escape through sloughs and other natural outlets, the levees confined the waters to the river channel proper and thus imposed upon the rivers a new and heavy burden. Nor was this all. When the freshets of springtime came with their volume of earthy sediment, the river hed was compelled to receive the entire deposit of accumulated sediment, except such as found its way through broken levees into new and unaccustomed places, or was carried in suspension to the hroad waters of our western sea. Thns the river channel, unable to relieve itself through its accustomed outlets and overflows, became more rapidly filled with mountain dehris, necessitating constant additions to the levees on either side.

A second and powerful added cause was the denudation of the mountain-sides of their magnificent forests. Before the inauguration of the gigantic lumber enterprises which, aided hy numerous forest fires, have rohhed our mountains of their best friend and protector, the washing down of dehris from the rocky soil of forest-covered mountain-sides was far more difficult and gradual than now. The protection aflorded by the forests was twofold. First, the shade of the forest caused the winter snow to melt more gradually, and, as a consequence, the freshets of spring were less frequent than now. Second, the roots of the trees, interlaced and interwoven with one another as they were, held the loose and rocky soil in place and provided a sponge-like receptacle for the water created by the melting snow. But now the forests are gone, the snow melts more rapidly, spring freshets multiply, and the loose and rocky soil, no longer held in place, is washed down into the canyons and thence into the levee-choked streams of the valley.

Again, tbe thousands of small farms and gardens scattered throughout the mountains have heen constantly loosening the soil and sending it on its way to the valley helow.

Another factor of no mean proportions is the grazing of numerous flocks and herds of sheep and cattle throughout the mountain regions. Only those who have lived in the mountains and witnessed the constant destruction of roads and trails hy vast droves of cattle and sheep can appreciate the prodigious amount of damage done hy the means ahove suggested. The naturally loose soil of steep mountain sides is still further loosened and made an easy prey to the ever-suhduing freshets of our rainy season.

The last of the causss added by man to the filling up of our valley streams was that of hydraulic mining. This industry, while it added to the flow of detritus from the mountains into our navigahle streams, did not and could not produce such serious and far-reaching results as some of the other causes above mentioned. This is now a generally recognized and admitted fact, though for a time, and until the matter became more perfectly understood, hydraulic mining was given undue prominence in the discussion of the causes that were productive of injury to our navigable waters. Nor was this without apparent reason, for the results of hydraulic mining were at once ascertainable and mathematically demonstrable, and, quite naturally, first attracted puhlic attention, while the more powerful, though less sharply apparent causes, escaped for a time the attention that has heen more recently directed to them.

A moment's reflection is sufficient to convince any reasonable man that the hydraulic miner, operating hut a few months in the year, in isolated places within a limited area of the placer mining belt, can send to the valleys hut a small accumulation of detritus as compared with the powerful and constant agencies unceasingly at work throughout the entire length and breadth of the Sierra Nevada mountains. The work of depositing detritus from the mountains and foothills in the valley streams and upon adjacent lands began centuries hefore hydraulic mining hecame a recognized industry, and, unless checked hy the application of appropriate means under governmental direction and authority, will continue for centuries after the last gravel hed has disappeared from the auriferous regions of California. The miner does not ask that the levee harriers be removed or that the lumberman be restrained in his devastation of the monntain forests, or that the thousands of small mountain farms and gardens he abandoned, or that the stock-raiser be prohihited from making a proper use of mountain ranges, but he *does* ask that the injuries wrought by nature, aided and ahetted hy the levee huilder, the lumherman, the forest fires, the gardener and the stock-raiser, be not all charged to the one comparatively small industry of hydraulic mining.

It is the plain duty of the General Government to protect its navigable waters—a duty fully recognized by the Federal authorities. Nor should the Federal Government be wholly unmindful of those to whom it has sold its puhlic lands. The farmer is entitled to whatever protection the Government can reasonahly afford him, and will, of course, reap the henefit of whatever means may he adopted hy the Government for the protection of its navigable streams, for the protection of the streams will mean the protection of the adjacent lands; and the hydraulic miner, who purchased his land from the Federal Government, with the full knowledge upon the part of the Government that the land thus purchased was to he mined by the hydraulic process, is entitled to some consideration at the hands of those who make and enforce our Federal laws.

Just how the Government should perform its duty with reference to the preservation of the Sacramento and Feather rivers has been a much discussed question and a suhject of repeated engineering experiments. It is clearly impracticable to properly preserve the rivers in question under the methods heretofore employed. The cessation of hydraulic mining (and there has been suhstantially no hydraulic mining for some years past) has not tended in any appreciahle degree to aid in the solution of the question, for it was but one of many causes leading to the same result. Nor is it wise to restrict the production of gold except for grave and clearly sufficient reasons. It is equally undesirable to prohihit or hamper the other important industries that have done much toward filling up our valley rivers, and no one wonld ask for the removal of the restraining levees notwithstanding their constant tendency to choke up the rivers with accumulated sediment. Lastly, it is absolutely impossihle to stop the neverceasing work of nature in her eflorts to level the mountains and wash them into the sea. There is then but one course to pursue, and, thanks to the genius of American engineers coupled with the practical experiments of the last few years, that course is now a plain, certain and feasihle one. It has heen fully and clearly demonstrated, hy means that no longer admit of the slightest question, that it is practicahle to construct restraining works and settling basins that will effectually impound all dehris from whatever cause arising that could work any material injury to the navigable streams or adjacent lands. Innumerahle sites, admirahly adapted for tbe construction of such works, can he readily found all along the mountains and foothills with abundant material for their construction immediately at hand. As was aptly said hy Senator Cross at the recent annual meeting of the California Miners' Association, the Almighty has prepared and placed at our disposal storage sites of unlimited capacity that only require a reasonable expenditure under proper engineering skill to be made availahle for the full and complete protection of every interest affected hy the flow of detritus from the mountains.

A practical view of the question was taken by our State Legislature at its last session when the plan here suggested was given the sanction of legislative endorsement. After wrestling with the question in its multifarious forms and phases for over ten years, the law-making body of our State finally adopted a policy based upon that true, though homely, adage, "An ounce of preventive is worth a pound of cure." It was ascertained that it would he far less expensive to lodge and permanently impound the dehris in mountain canyons and foothill basins than to remove the same after it had reached the valley streams. In fact the latter method, in view of the added material confined to the streams by the present system of levees, was found wholly impracticable and totally ineffective. After defining the term "hydraulic mining," as used and understood in California, and laying down the principle that hydraulic mining might he carried on wherever the same could be carried on without material injury to other interests, which was but a restatement of the principle laid down by our State and Federal courts, the Legislature proceeded to enunciate its policy concerning the protection of our rivers and valley lands from the flow of mountain dehris. The sum of $250,000 was appropriated for the purpose of constructing the necessary restraining works and a Commissioner provided who should superintend the construction of the same. This appropriation, however, is not to become availahle until Congress shall have appropriated at least as great a sum for similar purposes. In addition the Legislature provided for a system of public works, under the supervision of a compstent Commissioner, which should include the construction of artificial waterways to relieve the tremendous burdens imposed on our valley rivers at flood time, and thus compensate, in some degree, the unavoidahle evils of our levee system.

California has so far certainly done her full share toward working out a just and final solution of this more than ordinarily important question. The Federal Government can as certainly not afford to do less. Congress has already awakened to the necessities of the situation and has manifested its good intentions through the Congressional act commonly known as the "Caminetti Act," which has for its purpose the regulation of hydraulic mining and the protection of our navigahle streams. Let the good work so happily begun be carried on to a successful conclusion. Let financial aid come from the Treasury vaults at Washington to he supplemented by contrihutions from the Treasury of our own State; let American genius point out the way; and let well-paid American lahor construct the necessary works. Then will the songs of prosperity once more echo through the hills and canyons of our loved Sierras; the contented farmer in the valley will rest in conscious security; while millions of gold will be added to the channels of commerce; and the relieved waters of the Sacramento will flow "unvexed to the sea."

TIREY L. FORD.

NOTWITHSTANDING repeal of the purchase clause of the Sherman law, Colorado takes a hopeful view of the situation. The effect of repeal has heen anticipated in that State, and it has already directed its attention to development of its other fine resources. The opinion is generally expressed in Denver that repeal will aid rather than retard the cause of silver, and that a reaction is certain to be hrought ahout hy the necessity of the country for an enlarged use of silver. Meanwhile Colorado expects to produce from one-fourth to one-third the total gold output of the United States for 1893, and to that end is developing its gold fields with characteristic energy.

Slickens.

THE Herold Mill and Mining Company have filed a petition in insolvency. Its liabilities amonnt to $2151.92.

THE De Lamar Mining Company, of Idaho, October 24th paid its tenth dividend at the rate of 25 cents per share, amonnting to $100,000.

THE Homestake Mining Company of South Dakota paid its 133d consecutive dividend at the rate of 10 cents per share, aggregating $12,500, on October 25th.

TEN stamps are to be added to the mill of the Spanish mine, Nevada county, recently purchased by Colgate & Co., New York. Developments have been most satisfactory.

A NEW Colorado gold camp has been started sonthwest of the town of Monnment, which is abont 20 miles north of Colorado Springs. A large uumber of location certificates have been filed.

A NEW ledge has been discovered in the Crown Point quartz mine at Grass Valley. The ledge is abont 60 feet northeast of the main ledge, and is three feet thick, showing free gold, sulphurets and galena.

THE Alpha Consolidated Mill and Mining Company have re-elected the old officers, with Charles Hirshfield as president, A. K. P. Harmon vice-president, Cbarles E. Elliott secretary, and A. C. Hamilton superiutendent.

THE New York Placer Mining Company has incorporated to work mines in California. Directors—W. G. Roberts, Wm. E. Sbephan, Eugene J. Duffy, C. A. Malm and Joseph Roylance. Capital stock, $9000, and $250 subscribed.

THE Altman Gold and Silver Mining Company has incorporated to operate in El Dorado county. Directors—Wm. A. McNanghton, Edward A. Ayer, Daniel Hanlon, A. M. Brown and D. M. Angier. Capital, $2,000,000, and $500 snbscribed.

THE Sunset Gold Mining and Milling Company has filed articles of incorporation in this city. Directors—Geo. Beebe, Delos Pratt, Thomas R. Dunn, Mark Webber and Orson H. Elliott. Capital stock, $400,000, of which $40,000 has been snbscribed.

ARTICLES OF INCORPORATION have been filed iu tbis city on behalf of the Cienega Land, Marble and Granite Company. Directors—F. A. Berlin, M. H. Turrill, T. B. Key, F. P. Bacon, J. J. Burt. Capital, $1,000,000, of whicb $100,000 has been actually subscribed.

THE Black Hills Gold and Silver Extraction Mining and Milling Company has moved from Hill City to Deadwood, S. D. The company owns the exclusive rights of tbe cyanide process for the Black Hills. A mill has been in course of erection, and will soon be completed.

BETWEEN Jannary 1st and August 31, 1893, the mines of the Broken Hill Proprietary Company, Australia, prodnced 8,037,668 ounces of silver, and all Broken Hill mines 9,146,762 ounces. There seems to be no diminution of the Australia ontput despite the low price of silver.

THE Belmont mine, of Gilpin connty, is reported sold to California men for $150,000. A Colorado paper makes the sage remark that Colorado men go to California to bny mines and California men come to Colorado for the same purpose. The best things are always a long way from home.

THE Johannesbnrg (Transvaal) *Moon* of September 9th contains a fnll page portrait of Mr. Charles Butters, well known in this State. Comment of the *Moon* on the illustration is: "The portrait of Mr. Charles Butters, the eminent metallnrgist, jnst hits the bull's-eye in the middle." The *Moon* meant to cast no reflections ou Mr. Butters.

THE following appointments to positions in the San Francisco Branch Mint have been made: Jesse S. Wall of Alameda, cashier; Cbarles M. Otrom of Modoc, chip clerk; Wm. S. Linn of Alameda, helper; James Joyes of San Francisco, doorkeeper; John M. White of Santa Rosa, condnctor; John E. Graves of Monterey, watchman. The appointees have assumed their positions.

THE following is the cabled estimated return of Harqua Hala for the month of September: Crnshed during the month, 2700 tons; gross value of gold produced, $32,000; estimated total expenses, $11,200; estimated profit, $20,800; add miscellaneons revenue for qnarter ending September 30th, $1500—$22,300. The directors have declared an interim dividend of 18c per share (free from income tax) for the qnarter euding September 30th.

THE steamer Topeka, from Alaska, brought to Victoria on Sunday a uumber of Ynkon miners whose combined pile of "dnst" amounted to $60,000. They say there are some 300 prospectors in the conntry and all mainly doing well, there being enough gold there for the work. The men who go in, however, must be prepared to rough it. The results of mining for the past snmmer have been fitful, some men doing well and others the reverse.

A MINING camp for the Midway Plaisance at the Midwinter Fair is proposed. Admission will be charged. It will consist of one street, with a mountain backgronnd showing flumes and mines in operatiou. The streets will have "The Rest for the Weary" hotel and "The Dew Drop Inn," also a canvas saloon with the sign "Keno Here To-night." The arrival of the stage, the prospector driving his bnrro and other incidents to enliven it will be introduced.

THE Caruth Gold Mining Company has been organized at Baker City, Or. The capital stock is fixed at $1,500,000, divided into shares of $1 each. The incorporators are C. A. Johns, N. A. McMillan and J. H. Parker. The mines iucluded in this incorporation are what is knowu as the Norwood group, south extensions of the Virtue mine and which are being developed under a working bond to Messrs. N. A. McMillan and John Bolland, of Fort Worth, Texas.

THE dredging and amalgamating process is abont to be tried on the fine gold of the Columbia and Snake rivers. The matter is receiving the snpport of capital, and as a result three boats are being fitted np near Pasco. The largest of these will carry the dredging macbinery (Bncyrus). The second carries the amalgamator (Bennett), while the third serves as a supply boat to carry fnel and stores. The machinery is to be honsed in, and the boats fitted up so that work can be done with considerable comfort in all kinds of weather. The managers of the new project are anxions to get the machinery in place as soon as possible, and give the scheme a test before the winter begins.

ARTICLES OF INCORPORATION of the Pine Monntain Mining and Milling Company have been filed. The objecta as stated are to purchase and operate and mill properties in Pine Mountain mining district, connty of Inyo, Cal. The bnsiness is to be transacted at Big Pine, and the corporation to exist for 50 years. The directors are J. H. Bnlpitt and R. J. Scbober, Bishop; C. A. Collins, Laws; R. W. Thomas, Big Pine; P. W. Forbes, Independence. The capital stock is $20,000, divided into 20,000 shares of $1 each.

A YAKIMA (Wash.) man has an invention designed to elevate water for irrigating pnrposes. He claims that it is the most successfnl device yet invented for raising water by the power of the stream from which it is taken. An iron paddle-wheel, with long, thin steel paddles or wings, is placed near the bottom of a stream, at the small end of a long sheet-iron flume or cylinder. The cylinder is large at the upstream end, and the water, being forced through it, accnmnlates a strong head at the small end. To the wheel is attached a sprocket wheel and endless chain by which a bucket elevator or pump on the shore is operated. It is claimed that water can be raised to a height of 25 feet, and in snfficieut qnantity to irrigate a 160-acre farm.

IN all the experiments made with sulphurets that come out of the river between here and Empire, says the Dayton (Nev.) *Times*, it is fonnd that gold largely predominates in them. The ore worked in tbe mills on the river has been mostly silver ore, some gold, of conrse, being mixed in with it, but as it is easier to save the gold than silver when crnshing the ore, it is strange why gold predominates to snch a large degree in the sulphurets. There is only one way we can see that this can be accouuted for, and tbat is that the gold must come from the washes that have occurred from time to time for ages part. There is gold in almost every pound of dirt on all the hills arouud here, and the floods and rains have probably washed a great deal of it into the river, where it has been caught to considerable exteut by the amalgam and qnicksilver that has flowed from the mills.

England and the Midwinter Fair.

The London *Mining Journal*, one of the oldest and best of Englisb mining papers, in a recent issue contains an extended notice of the proposed Midwlnter Fair in San Francisco. It reviews the hlstory of the enterprise and says:

"Our American cousins are evldently not satisfied with having brought together at Chicago the very biggest thing in exhibitions the world has ever seen. They sigh for more World's Fairs, and they propose to have one at San Francisco. This show, wbich promises to be big also, though it is unlikely, of course, to assume the enormous dimensions of the Chicago display, will be a midwinter instead of a summer exhibition. It will open on January 1, 1894, and remain open for six months.

"As California spells nuggets—or did—the exhibition may be expected to hold open especial indncements for mining people. When the average English reader hears the words San Francisco he immediately thinks of Bret Harte and *The Luck of the Roaring Camp*. Visions of mining camps, "squar men," "heathen Chinese," and lovely young school "marms" in big top coats and heavy boots, immediately arise before his eyes. But the California of which Bret Harte sings so well no longer exists save in the author's fertile vision. It is many years since Mr. Harte left California to make his home in England, and since that time there have been many changes in his native land, especially in the States bordering on the Pacific ocean. Forty years will make as many changes in a comparatively new country as centuries would in an old and well developed land such as England. The rough mining camps of the early days, with their frame shanty "bars" and gambling saloons, have given place to handsome churches, luxurious hotels and busy factories. There are now a million and a half people where Bret Harte travelled for days meeting only a stray prospector engaged in his indefatigable search for gold. San Francisco is the eighth city in the United States. The "heathen Chinee" is still with the Californians, however, there being over 70,000 of the almond-eyed ones in the State. While gold mining is not the only industry in the country, it still holds its own as a producer of wealth. Since the discovery of gold in 1849 the production of California's gold mines has added $1,250,000,000 to the bullion wealth of the world and a still larger amount is believed yet to remain to be mined. But now mining has settled down to a business basis, and the mining people are no longer the rough and uncouth characters depicted by various writers, but they are intelligent, enterprising, and hospitable, and mining is pnrsued amid all the surroundings of civllization.

"But the Californian of to-day does not spend his time in seeking for gold only. The people have realized that the soil may yield more wealth than the mines. The lovely climate, whose balmy skies rival those of Nice and Cannes, and the fruitful soil make agriculture a pastime. The wheat crop of the State in 1892 was 38,554,000 bushels, the raisin crop 57,162,000 pounds, petroleum products 500,000 barrels, barley crop 12,333,000 bushels, wool crop 34,000,000 pounds, wine crop 15,000,000 gallons, and brandy product 2,000,000 gallons, and of fresh fruit 108,828,667 pounds were shipped from the State. In manufactures and fisheries as well as mining and agriculture the State made a favorable showing. The total value of San Francisco manufactures in 1892 was $94,000,000 and the average annual product of the California fisheries is $4,500,000. But enough of dry statistics, we have given figures enough to show that big nuggets do not form the sole topic of conversation in the polite circles of San Francisco. On the contrary, civilization has reached such a plane in San Francisco that it is possible to hold an International Exposition of the arts and sciences there."

Advice to Tenderfeet.

In a late issue of a Utah exchange, E. R. Cody gives advice to prospectors and tenderfeet. A prospector's outfit, he says, should consist of two ponies or jacks, a pail, pick, shovel, compass, gold pan, tin plate, tin cup, knife, fork, spoon, coffee pot, four double blankets, oil-cloth coat, rubber boots, a small tent and a supply of provisions.

The first thing to do is to examine the gravel and boulders of the mountain streams and note carefully the structure and character of the gravel wash. This will reveal the geological formations that are intersected by the streams. Try the sand at the head of the gravel bars for free gold, or any crystallized mineral-bearing quartz. If the structure of the quartz boulders or vein matter is favorable, go up the stream until the geological zone is found that has produced the quartz or other mineral-bearing rock; then follow the supposed mineral-bearing zone on its line, and make especially careful examination wherever eruptive dykes are found intersecting the formation. When a lode or vein is found, note carefully its relation to the country rock, especially any difference in the opposite walls of the vein; then follow it on the line of outcrop, and note carefully the points where the best ore is seen, so as to determine the position of the best ore chutes before making any location on the lode.

The first work should consist of shallow cuts across the vein at intervals of 50 to 100 feet, or if the vein is small and partially covered with soil and debris, a small trench along the line of the outcrop is preferable. If the surface is stationary and the true line of the strike has been determined, then survey your claim and stake off its boundaries according to the requirements of the laws of the United States.

Exploring the vein underground is the next thing in order. To do this intelligently you must select that point on the line of outcrop where the best ore is found; then sink a shaft on the vein following the angle of dip, keeping both foot and hanging walls exposed, if possible. If the vein is too wide for this to be done, follow the best or streak of the vein itself, and every 50 feet in depth run a crosscut to the walls of the vein.

After 100 feet depth has been reached, run lines each way from the shaft on the line of the vein, in order to determine the extent or spread of the ore chute or chimney on the horizontal line. When the limit of the ore body on the horizontal line has been ascertained, sink 100 feet more and drift right and left as before. If more than one chimney of ore is found on the line of the vein within your boundary lines, a shaft should be sunk on it also and drifts run as above stated, being careful always to confine all exploring work within the walls of the vein.

When enough has been done to prove the character, size and quality of the vein, it will then be time to determine the position, character and extent of dead work necessary to work the mine to the deep. These questions should be settled by careful survey, made in the light of all the local facts and surroundings, such as the geological structures of the country rock, the probable amount of water to be raised and the most convenient point of drainage by adit or level, and the most convenient point for the delivery of the ore to the surface, etc.

The last part of the preliminary exploration of any vein is to determine by actual tests what are the best methods of reduction and the extent of capacity, kind of reduction works needed, etc. After all these preliminary facts have been thoroughly ascertained and clearly defined, the unavailable risks of mining will have been fully met and overcome. All subsequent operations are simply a matter of skill and business management, and the capitalizing of the mine becomes a mere matter of business detail.

The first requirements are as follows:

First—The preliminary exploration must have ore enough cut, or under-run, or otherwise exposed, to give at least two years' work for a reduction plant of an extent for the annual average output of ore.

Second—The reduction plant must be suited for the best treatment of the ore.

Third—The exploration of the mine must be pushed ahead of the extraction of the ore, so as to expose at least one ton of ore in new ground for every twenty tons extracted from the previously explored ground.

A Point for Millmen.

Written for the MINING AND SCIENTIFIC PRESS by C. H. Aaron.

A good many years ago I was pervading, more or less, a certain assay office in this city. Among the students of practical, commercial assaying and analysis was a youog man who had graduated at the nniversity and had gone throngh mathematics up to, though not into, fluxions, yet was completely non-plnssed when a man came in with a note of the assay valne of his ore, his concentrates and hls tallings, and wanted to know how many tons he had "put into one."

The man had no note of weights, and onr "'varsity man" said the qnestion could not, therefore, be answered. I thought so myself at first, hut after the man had gone I perceived that it was a simple problem which could he solved hy means of the rule hy which grocers mix sugars of different grades to produce a given intermediate grade, though, having happily forgotten that rnle, I got the required answer by applying a modification of one of my rules for finding the weight of gold in a quartz specimen. (*V. Assaying, Part I, by C. H. Aaron, for sale at this office.*)

The student could hy no means make it out, and this is an illnstration of the difficulty which highly edocated *young* men find in applying their knowledge to practical uses, though, no donbt, if the question had come in the time-honored form of the sugar, or sugar-and-sand problem, he would at once have recalled his Cocker.

Either of the methods mentioned, however, reqnires a little secondary work to reach an answer to the question, "How many tons have been put into one?" And I have fonnd a neater and simpler solntion which may be new and will surely be useful, especially in the application which I shall point out. Algebraically it is as follows:

Headings assay per ton, 127 oz. $= a$.
Tailings " " " 6 " $= b$.
Ore " " " 34 " $= c$.

$$a + b(x - 1) = cx$$

expanding and transposing,

$$a - b = cx - bx$$

snbstituting values of a, b, c,

$$121 = 28x$$
$$x = 4.3214,$$

that is, 4.3214 tons of ore were reqnired to produce one ton of headings (concentrates). This gives us the following arithmetical

RULE.—*From the assay value per ton of ore and of headings, respectively, subtract the assay value per ton of tailings; divide the lesser remainder by the greater, the quotient is the answer sought.*

Thus in the ahove example:

$$127 - 6 = 121$$
$$34 - 6 = 28$$
$$121 \div 28 = 4.3214$$ tons (or parts) of ore reduced to 1 ton (or part) of concentrates.

The rule can he applied to the mixing of sand and sugar, though I do not recommend it for that purpose.

As Bunsby would say, "The bearin's o' this 'ere observation lays in the application of it." Not only can we find out how many tons have been put into one, but, lf the headlngs he dried and weighed, we can ascertaln how many tons in all have been crushed by mnltiplying the number reqnired to produce one ton of headings by the total weight of headings in tons; thus, in the example given, if total headings weigh 6.617 tons, then $6.617 \times 4.3214 = 28.595$ tons must have been crushed. If the sampling and assaying have been correct, the weight of ore crushed is known with corresponding exactitude, even though it may not have heen weighed to the battery. Even if it has heen weighed, the method affords a check free from complication of moisture.

It may be necessary to say that for this pnrpose, if the ore contains free gold which is amalgamated in hatteries or on plates, the sample for ore assay must he taken from the pulp delivered to the concentrators. The assay value of the orlginal ore may then he known by dividing the value of the amalgam hy the number of tons crushed, and adding the result to that found by the assay of the pulp going to the concentrators, and probably more accurately than by sampling from the rock-breaker—the only alternative when battery amalgamation ls practiced. C. H. AARON.

The Situation at Johannesburg.

A Montana miner, C. Y. Reeder, who recently arrived in Sonth Africa, sums up the situation there in a letter to a cousin at Butte. It will be found interesting reading to those who contemplate a journey to the Mecca of impoverished miners, Johanneshurg. That city is discribed as a most wonderful mining camp. The population of 25,000 is one-half native Kaffirs. This class do all the menial lahor in and ahont the city and also all the mining and other work ahont the mines and mills. These Kaffirs or hlacks receive for their lahor ahont the stores, hotels and residences in the city from 5 to 15 shillings per week. Those who work in the mines and around the mines and mills receive from 10 to 17 shllliogs per week. At the mines they are furnished with rations of "mealies" or cornmeal in addition to their pay. At some of the mines they are also furnished with a ration of meat once a week and at others twice a week.

"From this statement you wlll see," says Reeder, "that this country is no place for the American mloer or the poor white laborer. There is room here for expert miners, men with the ability, education and qualifications for managing properties aod controlliog and hossing the labor in the mines and superintendiog the construction of mills, etc. I am told that from 4 ceots to 10 cents at the most will keep a Kaffir per day. I have not yet ioquired what salaries clerks and bookkeepers and that class of employes receive.

"Hammond, Clements and Conners of California arrived here one week ahead of me to enter the employ of Baroato Bros., Hammond as an expert at a salary of $20,000 per year, Conners as an eogineer at a salary of $12,000 per year and Clements as mine manager at a salary of $6000 per year. Mr. Clements had charge of the Sullivan & Bunker Hill mine in the Cœur d'Alene country during the trouble there.

"Many English mine managers' heads are being chopped off and American experts are taking their places. A. G. Phillips, once with the Moulton Company, was made manager of the Reitfountain mines and mills Ang. 10. There is room here for a limited numher of first-class mechanics of all kinds. Board and lodgings at hotels from $15 to $20 per week. The smallpox is bad here, hut I am not afraid of it."

Tellurium and Selenium in California.

Reprinted by request from the report of the State Mineralogist for 1884.

The following letter contains a great deal of information concerniog the tellurium minerals in California:

Henry G. Hanks, San Francisco, Cal. DEAR SIR:—In answer to your question respecting the localities where tellurium is found in California, I can say that I have seen it in considerable quantities in Mariposa county, especially on the Merced river, not far from the Marhle Spring mine. I have heard of it in the ores of the Mariposa Company and have seen specimens said to have come from that property. Following the western branch of the mother vein, north, tellurium is found in large quantities in the Rawhide mloe, near Chinese Camp, and in many mines around Tuttletown. Crossing the Stanislaus river, at Robinson's ferry, tellurium is found in masses, accompanied with massive gold, in the Stanislaus mine, and as tellnride of lead in the Adelaide mine. In the Morgan mine, it appears as calaverite, petzite, and sylvanite, accompanied by gold in large masses; also, telluride of lead carrying gold. All the mioes on Carson Hill where the Morgan mine is situated, have ores more or less associated with tellurium or tellurium compounds. I have heard of tellurium in Placer connty, and I have seen it in Nevada, Butte, and Sierra counties. In Slerra county In the the Oriental mine, very fine ores of tellurium are fonnd associated with free gold and arsenical pyrites rlch in gold. In the Murchie mine, Nevada county, very fine tellurides are found, and also in many mines on Feather river.

Ores of tellurium are difficult to work. In the raw way this mineral is detrimental to and sometimes utterly prevents amalgamation. It is volatile and disappears in roasting, carrylog the gold with it, unless the greatest care is taken.

In *all* cases that have so far come under my observation the ores containing tellurium are very rlch in gold, the tellurium invariably heiog rich in precious metals. In Bowlder county, Colorado, I have seen a compound of lead and tellurium, but in California I have never seen a simple compound of this sort—gold is always a factor and generally silver also.

Higher up in the mountains selenlum is found also associated with gold. At the Oro Plata mine, in Murphy's, Calaveras county, seven miles from Carson Hill, compounds of selenium, gold, and copper are found. The mineral here ls not massive, hut exists in segregated crystals, very minute. The per cent of mineral in the ore ls rarely over one-half of ooe per cent and generally less than one-elghth of one per cent, hut the coocentrates of this mineral are worth from $4,000 to $8,000 per ton. I have tested tellurium worth from $40,000 to $80,000 a ton from the various mines I have mentioned. I have an idea that tellurium accompanies the western hranch of the mother vein throughout the State. I helieve when more attention is paid to the refractory ores of Californla that tellurium and selenium will he found very valuable additions to the gold-hearing rocks of the State and worthy speclal study. Very trnly yours, Z. A. WILLARD.

San Francisco, March 8, 1884.

Treatment of Nickel, Zinc, Aluminum and Tin Ores.

Extracts from Paper on American Improvements and Inventions, Read before the American Institute of Mining Engineers at its August Meetiog, Chicago, by James Douglas of New York City.

Nickel.—Untll the ore aod matte from Sndhnry, Ont., were imported, the ooly nickel commercially produced in this couotry, apart from small qnantities whlch came as a hy-product from the lead mines of Missouri, was extracted hy Mr. J. Wharton from the Lancaster Gap mine, Pa., aod converted into metal and nickel salts at his works in Camden, N. J., hy methods which were kept profoundly secret. Now that nickel-steel has created an increased demaod for the metal or its oxide, the methods of reduction have been extensively investigated. Ooe result has heen the patentiog hy Messrs. J. L. and R. M. Thompsoo, and the practical operation on a large scale hy the Orford Copper Company of a method for separating nickel from copper-oickel ores and mattes hy smeltiog the mixed sulphide of iron, copper and nickel with an alkaline sulphlde, or with acid salt-cake. On tapping the charge, sulphide of nickel, with a small proportion of the copper and iron sulphide, settles to the hottom of the pot, while the sulphide of iron and copper, with a very small proportion of sulphide of nickel and a large proportion of the salts of the alkali used, form a very distinct, easily separated, upper layer. By re-treatiog the hottoms, a still further elimination of forelgn metals is effected, until ultimately pure nickel sulphide is obtained. The consumption of alkali is reduced hy recoveriog it from the tops. The company, hy this method, puts on the market large quantities of nickel oxide made by roasting the sulphurets, and contaminated with ooly a trifling amount of iron oxide.

The oxidized nickel ores of the West have not yet entered the market extensively.

Aluminum.—The snccessful agent of recent investigation in the metallurgy of aluminum has been electricity, and this is an agent which we have not been backward in trying to harness to our metallurgical vehicle and turn to our use. This country may claim unquestionahle priority of invention for one electrical method of treating aluminons compounds, and at least independent simnltaneity for another.

The Cowles Bros. of Cleveland, Ohio, patented in 1885 a process and the necessary appliances for producing aluminum hy the decomposition of cornndum in the electric arc, and for formlog aluminum alloys hy decomposing the corundum in the presence of granules of copper and other metals. They place the alumina, whether corundum or prepared oxide, with charcoal, and the metal wlth which the aluminum is to be alloyed, hetween the electrodes of a dynamo in a carhon-lined aod covered trough. A current of ahout 8 volts and 3000 amperes is turned on; the alumina is decomposed, and as aluminum is formed, it combines with the fused copper, or other metal, and the alloy collects in globules or masses. The oxides of calcium, magneslum, manganese, silicon, harium and the alkalies are decomposed in the Cowles furnace with the production of these elements and metallurgical alloys, which it would he difficult to make otherwise.

The only other process under which aluminum and its alloys are made in commercial quantities in this country is that pateoted by C. M. Hall, and operated hy the Pittsburg Reducing Company, which "reduces the metal from its oxide alumina hy electrolysis, the alumioa heing held in solution hy a molten fluoride hath, which itself is not decomposed by the electric current. The latter is conveyed to the melted solution hy means of carhon cylinders placed in the hath for positive electrodes, a carhon-lined metal pot forming the negative electrode.

"The oxygen of the alumioa goes off at the positive electrode as carhonic acid, wearing away the carbon at the rate of nearly a pound of carhon to the pound of aluminum produced. The reduced metal settles to the bottom of the pot, from which it is easily tapped or ladled off, practical? free from the electrolyte. Re-meltiog eotirely purifies it."

There are poiots of resemblance hetween the Hall process and the Beroard process used at Creil, Fraoce, and more remote similarity hetween the Cowles system and that in operation at the large works of Mülhausen, on the Rhine.

Zinc.—Despite the wide diffuslon of zinc, and the large size of some of the zioc deposits in this country, no important improvement has heen made in its metallurgy since the invention hy Wetherill, in 1855, of a method for making zlnc white hy hurning with forced draft, on the perforated grate hars of a specially constructed furnace, a layer of anthracite pea or nut coal upon which is spread a hed of naturally or artificially oxidized zlnc ore, mixed with ahout one-third its weight of anthracite slack. The zinc is simnltaneously volatilized and oxidized, aud the white zinc collected in mnslln hags. At the New Jersey Zlnc Company's Works, at Newark, franklinite ore from its mines at Mine

Hill, N. J., is thus treated for the extraction of most of its zinc. The remaining iron and manganese are run down into spiegeleisen, and the zinc fumes which escape from the blast furnace are treated for spelter.

There is a profitable field for metallurgical research and invention in devising an economical method of recovering the zinc from the mixed ores of lead, zinc and copper of the Rocky mountains, where they are at present far from being a source of profit, the most troublesome and wasteful element with which the furnaceman has to deal. The Cowles Bros. were experimenting in this direction, and with this aim, with their electrolytic furnace, when their attention was deflected from zinc to aluminum.

Mercury.—The mining and metallurgy of quicksilver is almost wholly confined to California. Of the total of 101,336 flasks made in the country, only about 2300 flasks are reported in the last census year from Oregon and Utah.

The *tierra* and *granza* furnaces used in California do not differ in principle or in their main features of construction from the distillation furnaces for coarse and fine ores, of Europe; but in their accessories ingenuity and money have been expended with a view to minimizing labor, while in compactness of plan and neatness of construction, the California works contrast favorably with the older European establishments.

In 1876 the necessity of saving labor led to the construc- and adoption at New Almaden of the Hüttener and Scott vertical shelf furnace, for roasting cinnabar fines. The Livermore inclined shelf furnace is a later invention.

Antimony.—At present, antimony is not made in this country in commercial quantities, though in Utah, Nevada, Montana, Colorado, and Arkansas, there are deposits of stibnite of considerable extent. In 1881 a very good grade of antimony was made from the oxidized ores of Sonora, Mexico, at Oakland, California. The reduction was effected in a low 36-inch diameter cupola, and the refining was done in crucibles; but the enterprise was short lived. The same was true of the operation of the Stayton Mining Company, who some years earlier treated antimony ores from California in reverberatories; also of the works run by Faber at Battle Mount, Nevada, on stibnite from Humboldt county, Nevada; of the more extensive establishment in Salt Lake City for treating the antimony ores of south Utah, and of a Philadelphia company, who made for a time in Philadephia a good article out of the concentrated ores of Arkansas, by the English crucible method.

Tin.—Though tin exists in Arkansas, is widely diffused from Maine to Alabama in the Appalachian range, and has been exploited in Dakota and California, the mining of it so far has nowhere been sufficiently remunerative to create a smelting industry. The concentrating mills constructed in Dakota and California include substantially the machinery and automatic methods employed in the mechanical treatment of other ores, and therefore differ widely from the dressing floors of a Cornish tin works.

A Great Pumping Plant.

Edward P. Allis, of Milwaukee, Wis., has just built for the Chapin Mining Company at Iron Mountain, Mich., pumping machinery to raise water up a vertical shaft from a depth of 1500 feet.

The great size of the engine and the depth from which the water is to be raised make this one of the most important installations of mine-drainage machinery in the United States. It is one of the few instances in which the engines are located on the surface. The details of construction, as given in the *Engineering News*, will be found interesting.

Notwithstanding advantages of direct-acting pumping engines for most cases of mine drainage, it will be seen that the conditions here practically prohibited the use of an underground engine. An engine of sufficient power to raise water from a depth of 1500 feet was wanted, but at the same time it would be some years before the shaft could reach this depth, and meanwhile the work at smaller depths had to be dralned. Again, the condensation would be very great in piping steam such a distance underground even with the most careful and complete lagging. These, with the lesser considerations of danger from accidents and the difficulty in erecting an engine of the requisite power underground largely determined the location of the engine.

The only other mine-pumping engine which we now recall that compares with this one in size is the engine designed by Mr. John West for the Lehigh Zinc Co., and erected at their mines near Bethlehem, Pa., in 1871. This is a simple engine with a cylinder 9 feet 2 inches in diameter and 10-foot stroke, and a flywheel weighing 92 tons and 30 feet in diameter, on each side of the cylinder. It operates four lift pumps 31½ inches in diameter, discharging into tanks 96 feet from the surface and four plunger pumps forcing the water to the surface. The capacity of this engine is 17,000 gallons of water per minute from a depth of 300 feet. The steam valves are balanced valves 20 inches in diameter and with a 1¾-inch lift, and the exhaust valves are 30 inches in diameter with a 3-inch lift. The size and weight of some of the parts are enormous. The power of the engine working under 60 lbs. pressure is 3000 H. P.

The general design of the engine is a vertical steeple compound, driving the pumps through a walking-beam, motion being imparted to the crank and flywheel by means of a connecting-rod extending from the lower side of the beam to the crank-pin. The high-pressure cylinder is 50 inches in diameter, and the low-pressure cylinder 100 inches in diameter, and the stroke is ten feet. Thus the ratio of the cylinders is one to four.

Both cylinders are fitted with double-beat poppet valves, the high-pressure valves being operated by trip cut-off gear, and the low-pressure valves by toes and lifters using Stevens' cut-off. The engine is designed to work with 125 pounds pressure, and at speeds varying from five to ten revolutions per minute. At ten revolutions the capacity is 3200 gallons of water per minute from a depth of 1500 feet. An independent steam-power or air pump is employed. The surface condenser uses part of the water pumped from the mine for condensing purposes. Steam is supplied by vertical tubular boilers of the Reynolds type.

A peculiar feature of the engine is that the cylinders and valve gear are so proportioned and arranged that the engine can be run by compressed air instead of steam if desired. The air will be supplied by the company's compressed-air plant, at Quinnesec Falls. This plant is run by water power.

Perhaps the best idea of the great size of the engine is obtained by observing the dimensions of some of the details. The total height above the engine-room floor is 54 feet, and the total weight of the machine, exclusive of the pumps, is 600 tons. The flywheel is 40 feet in diameter and weighs 160 tons, and the walking-beam is 32 feet c. to c., and weighs complete 100 tons. The connecting-rod is 30 feet c. to c., and 15 inches in diameter. The journals of the main shaft and of the beam centers are 24 inches in diameter and three feet long. The crank-pin, crosshead-pin and the pins of the beam have bearings 16 inches in diameter and 18 inches long.

As already stated, the final depth of the shaft will be 1500 feet, but at present it is only about 600 feet deep, and only three sets of pumps are now in place. The first is about 200 feet below the surface, and the others are below this and about 193 feet apart. All three pumps are operated by a steel pump-rod seven inches in diameter, running in adjustable bracket guides, 22 feet apart, attached to the timbering of the shaft. The pump-rod is operated from the outer end of the walking-beam through a connecting-rod 23 feet long, to which the pump-rod is joined by a crosshead running in cast-iron guides. The general design of this crosshead is exactly the same as that of the pump crosshead. The pump-rod is made up in sections 22 feet long, which are connected by a cast-steel clamp coupling.

The pumps are of the ordinary "Cornish" single-acting outside packed plunger type, and each is fitted with a single-suction and a single-delivery valve. The plungers are 28 inches in diameter and have a 10-foot stroke. The valves are of the double-beat "Cornish" type. The valves have two passages for water, one of 263 square inches and the other of 340 square inches area, making the total area of the water passage 603 square inches. The lifting area is 222 sugare inches and the lifting pressure 1.52 pounds per square inch. The weight of the valve in water is 340 pounds. It is interesting to note at this point that, while the general tendency in this country in designing pumping engines is toward the use of a number of small valves instead of one large valve in water ends, designers of such high reputation as Mr. Reynolds and his staff preferred in this case to use a single large valve.

Each pump stands in a wrought-iron tank, or "sump," and each discharges through a 28-inch rising main into the tank of the pump above. The pumps are supported on wrought-iron columns, which in turn rest on heavy 30-inch girders built into the shaft. The weight carried by these girders, including the thrust of the pumps, is about 100 tons for each set of pumps. The wrought-iron columns are made adjustable for a sufficient height to permit keeping the pumps in line in case the girders settle.

The weight of the pump plungers, rods and connections is calculated to do half of the work on the down stroke, the remainder of the power necessary being supplied by the engine. On the up stroke the engines have, of course, to do an equal amount of work in lifting the dead weight of these various parts. In order to get the proper balance to secure this result, a balance bob is placed at a point about 50 feet above the present lower set of pumps, *i. e.*, about 550 feet from the surface. The arm of this balance is 24 feet long and is attached to the pump rod at one end and carries at the other end a counterweight of 35,000 pounds. The connection with the pump rod is made by two links which attach to a crosshead clamped to the rod.

Decision in a Mining Case.

Judge Prewett, of the Superior Court of Placer county, has just rendered a decision of importance in the case of Van Vacter, plaintiff, versus Booth *et al*, defendants. The full text is as follows:

The mining claim claimed by the plaintiff was located in 1881. Neither she nor her predecessors in interest have ever performed any labor thereon, but the claim has been leased from year to year to some Chinese, who have annually, since 1883, performed at least $100 worth of labor, except possibly during the year 1892.

An unusual number of very important questions involving mining law have arisen during the progress of this case, but the decision of the case really turns upon the sufficiency of the marking of the claim on the ground to constitute a valid location.

The evidence is clear that two stakes were set at the two upper corners of the claim, but equivocal and doubtful as to whether the locators placed any stakes at the lower end.

The claim is of the class known as a "river claim," and purports to extend along the bottom of the American river canyon a distance of 3000 feet, and to extend 150 feet on each side of the center of the river.

The evidence shows that the sides of the canyon are steep, uneven, precipitous and brushy, and that the river has a number of turns in its course through the claim.

Assuming that all four of the stakes were properly set, we have then this naked question: Will four stakes set as above described, two on each side of the river and more than one-half a mile apart, mark a claim so that its boundaries may be readily traced by a stranger who honestly sought information as to whether the land was located or not?

The whole object and purpose of marking the boundaries is to place on the ground such physical monuments as will indicate to the eye the fact that the claim is appropriated and the exterior limits of the appropriation.

The solution of this question cannot be made to depend in any degree upon any posted notice or the record thereof, because no evidence was offered by either party to show any mining rule of the district which requires either the posting or recordation of a notice.

In the absence of such evidence the Supreme Court has held that the Superior Court cannot take judicial notice of the existence of such a local rule, if in fact it exists. 73 Cal., 109.

"A location notice is only a temporary expedient until the other necessary acts of location are completed." 83 Cal., 131.

"A location notice is unnecessary unless required by the local rules of the district." 83 Cal., 188.

"Neither is it necessary to record it unless required by the local rules." 72 Cal., 533; 78 Cal., 544; 83 Cal., 188; 83 Cal., 296.

The one requirement, however, that is indispensable and essential in all cases to make the location valid is that the claim must be distinctly marked on the ground, so that its bounndaries may be readily traced. 53 Cal., 150; 17 P. R., 728 and 547; 89 Cal., 310; 83 Cal., 296 and 187; 88 Cal., 131; 33 P. R., 677; 78 Cal., 595 and 546; 65 Cal., 420 and 555; 59 Cal., 612; 53 Cal., 217; 67 Cal., 656 and 111; 70 Cal., 226; 73 Cal., 109; 55 Cal., 261; 130 U. S., 291, and many others.

The plaintiff caused her notice of location to be recorded, and there is some evidence which shows that it may possibly have been posted, but its recitals are evidence of nothing; first, because it does not appear to have been required by any local rules (83 Cal., 298, and 38 P. R., 677), and secondly, it would be at best only *prima facie* evidence of the matters required by the U. S. mining laws to be stated in it, and the fact that the boundaries are marked is not one.—20 P. R., 807; 11 Colo., 380; 8 Mont., 168, 242, 248 and 298.

Can it be said that these four stakes, 300 feet apart one way and 3000 the other, and in a timbered, uneven canyon, mark the claim so that its boundaries can be readily traced? I think not.

The very object, and I may add the only object, of the stakes is to point out the claim so that its boundaries may be readily traced.

If they do this, then four are sufficient, and the location is valid; if they fail to do this, then to make the location valid would require such increase in the number of stakes as would readily mark the boundaries.

The opinion is widespread, but as erroneous as widespread, that it is always sufficient to place a stake at each corner of the claim.

This, in some cases, is undoubtedly sufficient; but the true, final and only test is, "Can the boundaries be readily traced?" It is obvious that in the application of this simple rule some places will require more stakes than others. It is impossible to establish any number that will apply to

all cases. Each case must be determined according to the character of the ground and the reasonable necessity for a greater or less number of stakes.

The Supreme Court has stated the rule correctly in the following extract:

The Superior Court instructed the jury "that a monument of stone two feet high placed in the center of the location, with a notice of location placed thereon, and a similar monument of stone or a stake at the center of each end of the location and at each corner are a sufficient marking on the ground to constitute a valid location of a mining claim." That depends on the condition of the ground to be located. If the conformation is such that monuments and stakes of the description given would so mark the boundaries as that they could be readily traced they would be sufficient. Otherwise not; but that was a question for the jury.—67 Cal., 656.

In the case just quoted it is seen that the Supreme Court refused to declare that even seven stakes were sufficient as a matter of law to constitute a valid location.

On a treeless, level plain doubtless a stake at each corner would be sufficient, but in a rough, uneven, brushy country it certainly would not.

"If recording is not required (by the local rules) it is useless and left out of account."—83 Cal., 298.

I find it unnecessary to determine the constitutionality or force of the statute of 1891 (p. 219) requiring affidavits of annual work to be filed with the County Recorder. It is at best a very crude statute, but is probably operative for some purposes.

Let the defendants prepare findings, and thereon let judgment be entered in favor of defendants, with costs.

PREWETT, Judge.

American Mining Machinery.

If there is one department of industry in which the craftsmen of the New World especially excel, it is in the manufacture of machinery for mining purposes, says *Money and Trade* (London). In this respect they have distanced all competitors, including those of Great Britain and central Europe, their chief strength lying in the construction of novel and time-saving appliances. As regards workmanship, it is probable that our own manufacturers in the Midlands and in the North can more than hold their own; but in these days quality is not the only merit required. Admit, for sake of argument, that an English machine costing £1000 may last ten years, as against six years in the case of some Transatlantic product; nevertheless the latter may be the cheaper article by far. The true test of cheapness is the volume of work performed. Comparative durability is of little consequence if the American machinery saves in time and wages; in other words, does more work in a given time or at a given cost. Our fault is lack of inventiveness. Outside of coal and iron-mining machinery, we are miserably behind the Americans in this essential, probably because we have no gold and silver mines worth mentioning at our doors. There is no reason, all the same, why the miners in South Africa and in Central and South America should be compelled to look New York-wise for their requirements. They are doing so, unfortunately, to a very large extent, and their choice of American plant is justified. Whatever its quality, it wins quartz cheaply, and, although labor is dear in the States, the cost of production in some of the American gold mines has been reduced to about 5s. a ton. Inventiveness is the secret.

For the Midwinter Fair.

We give on this page a picture of the Administration Building of the Midwinter Exposition, reproduced from the *Illustrated Pacific States*. This building was designed by A. Page Brown. It is the smallest of the five main buildings of the fair, but is intended to be the most attractive in style and ornamentation. Its design is oriental, with additions. It consists of a central square structure covered by a lofty dome, and has four pavilions, one on each corner of the square. All sides will be of equal dignity and finish, and the building will be, both in its style and its functions, the natural center of the midwinter plant. It will have considerable height and will be a striking object, as it is intended to be. In it all the executive offices of the fair will be situated.

ADMINISTRATION BUILDING AT THE MIDWINTER EXPOSITION.

HIGH-GRADE ORE having been uncovered in the Rawhide mine, Tuolumne county, the *Union Democrat* declares that similar results may be obtained in the Rappahannock, Isabella and Gem, Alabama, Tarantula and other mines in that vicinity all in the mother lode. Practical tests of the ores from these mines give the most gratifying results, and prove conclusively that they are properties of value.

Scientific Progress.

Size of the Sea.

One gallon of water weighs ten pounds, so the number of gallons in the Pacific is over 200,000,000,000,000 — an amount which would take more than a million years to pass over the falls of Niagara. Yet, put into a sphere, the whole of the Pacific would measure only 726 miles across, says an English exchange.

The Atlantic could be contained bodily in the Pacific nearly three times. The number of cubic feet is 117, followed by 17 ciphers —a number that would be ticked by 1,000,000 clocks in 370,000,000 years. Its weight is 325,000,000,000,000 tons, and the number of gallons in it 73,000,000,000,000.

A sphere to hold the Atlantic would have to be 533½ miles in diameter. If it were made to fill a circular pipe reaching from the earth to the sun—a distance of 93,000,000 miles—the diameter of the pipe would be 1837 yards, or rather over a mile; while a pipe of similar length to contain the Pacific would be over 1¾ miles across.

Yet the distance to the sun is so great that, as has been pointed out, if a child were born with an arm long enough to reach to the sun, it would not live long enough to know that it had touched it, for sensation passes along our nerves at the rate of 100 feet a second, and to travel from the sun to the earth at that rate would take a century and a half, and such an abnormal infant is an unlikely centenarian.

The rest of the sea includes the Indian ocean, the Arctic and Antarctic seas, and various smaller masses of water; it covers an area of 42,000,000 square miles, and would form a circle of 7300 miles in diameter.

The average depth may be put at 2000 fathoms (12,000 feet), and the contents at 95,000,000 cubic miles. It weighs 390,000,000,000,000 tons, and contains 87,500,000,000,000 gallons; while it would form a column reaching to the sun of 2000 yards in diameter.

If we now combine into one vast whole these figures, we arrive at some stupendous results in answer to the question, "How big is the sea?"

Its area of 140,000,000 square miles could be confined by a circle 13,330 miles across. The relative size of the areas of the whole surface of the earth, of the whole sea, the Pacific and the Atlantic, are represented by circles, the diameters of which are in the proportions to one another of 158, 133, 93 and 62 respectively; or by a crown for the surface of the earth, a half-crown for the surface of the whole sea, a shilling for the surface of the Pacific, a three-penny piece for the surface of the Atlantic.

Supposing the sea to be formed into a round column reaching to the sun, the diameter of the column would be nearly 2½ miles. The Pacific would form 53,000,000 miles of its total length of 93,000,000, and the Atlantic 18,000,000.

If it were a column of ice, and the entire heat of the sun could be concentrated upon it, it would be all melted in one second, and converted into steam in eight seconds, which illustrates the heat of the sun rather than the size of the sea.

Phosphorescent Minerals.

Mr. Jacksh, of Trieste, Moravia, as quoted by the *Popular Science Monthly*, names four snlphurets which becomes phosphorescent after a brief exposure to daylight—the sulphurets of calcium, strontium, barium and zinc. The last compound has been obtained in a luminous condition only recently by distillation in a vacuum. Prepared in the usual way, by precipitating soluble salts of zinc with sulphurets, it shows no signs of phosphorescence. Sulphnret of barium gives a yellowish orange glow, but only for a few minutes after each exposure to the light, and is of as little use as the sulphurets of strontium and of zinc, the greenish glow of which disappears after about two hours. For practical uses the sulphuret of calcium of commerce is the only phosphorescent of value. Pure, it gives a faint yellowish light, but treated at a red heat, with the addition of a small quantity of a salt of bismuth, it is transformed into a substance giving a violet light and retaining its luminous quality for nearly 40 hours after an exposure of only a few seconds.

Salt from Reclaimed Sea Lands.

Dr. C. V. Riley, of the Department of Agriculture, to whom the *Scientific American* referred a request to know how to get rid of salt in land reclaimed from the sea, writes as follows:

I received a note from you requesting an answer to a questlon asked by one of your subscribers, as to what process should be used to get rid of the salt in land that has been reclaimed from the sea and dried, and what plants can be set therein to the greatest advantage. The question cannot be intelligently answered without more detailed information as to the nature of the soil and the latitude. If the land is sandy, there is no better way than by leaching through irrigation, and the natural rains ln time will do this, if there is good drainage. If the soil is tenacious, it will, however, be very difficult to get rid of the salt. The plants which would be recommended for a northern latitude would be different from those which might succeed in a more southern climate. There are certain grasses which thrive in salt lands, especlally sandy lands; for example, the so-called black grasses, which make fairly good hay and are used for various other purposes. These are *Spartina juncea* and *Juncus gerardi*. Another grass which thrives in sandy soils and helps to prevent the sand from drifting is *Ammophila arundinacea*.

These will all grow in northern latitudes, and the salt marsh grasses, when they once get a good foothold, will thrive in such soil. The barberries and the species of euonymus, especially *Euonymus japonica*, are known to thrive in salty lands. Of cultivated crops, the experience of the Mormons in Utah, near the Great Salt Lake, would indicate that beets, followed by potatoes, are among the most profitable crops in saline lands. It is questionable whether much salt long remains to be of any injury to ordinary plants in reclaimed lands that are not periodically overflowed again by salt water.

Life in Paris Water Mains.

In a pamphlet issued, M. Arnould Locard discusses the peculiar fauna of the Paris water mains, which it appears are infested by numerons mollusks, which appear to thrive well in their environment. The largest of these mollusks are the *Dreissentia Arnouldi*, which attain sizes up to 1½ inches and are comparatively more numerous in the water mains than in the River Seine. They fasten themselves firmly to the sides of the mains, and form a great obstruction to the passage of the water. So firmly do they adhere that very powerful scrapers are required to move them. As for remedy, M. Locard suggests that the mains should be laid dry for a few days, when the mollusks would die, and might then be removed, and the main thoroughly washed out before being again used for conveying potable water. To prevent their re-introduction, the water supply should invariably be filtered before passing into the mains.

The Age of Aluminum.

Science will yet achieve, says a Pittsburg writer, the reduction of aluminum to a cost which will substitute this wonderful metal in place of steel, silver, iron, copper and what not? Science is at work on thls, and if successful, its fabulous results will accomplish for the next century what steam and electricity have done for this. With its inexhaustible deposits the solution of the question of its cheap production will, in a few years, give us aluminum vessels, houses, railroad cars, street cars and heaven knows what not. It is only a question of time before the inauguration of the aluminum age, and when it comes the world will have made the same stride in progressive science that it did when it harnessed steam and buckled the belt of electricity around the globe to do the work of the world and measure itself to the use of man.

A Cunning Toad.

A scientific journal tells this story of a toad's cunning: A brood of chickens was fed with moistened meal in saucers, and when the dough soured a little it attracted large numbers of flies. An observant toad had evidently noticed thls, and every day toward evening he would make his appearance in the yard, hop to a saucer, climb in, and roll over and over until he was covered with meal, having done which he awalted developments. The flies, enticed by the smell, soon swarmed around the scheming batrachian, and whenever one passed within two inches or so of his nose, his tongue darted out and the fly disappeared. The plan worked so well that the toad made a regular business of it.

Oil in Water.

An interesting account is in circulation of how Prof. Oberbeck of Greifswald went to sea on a boat, armed with bottles of oil containing measnred quantities, which he poured upon the wake in a thin continuous stream. Afterward, on revisiting his tracks, he found the oil had spread out into broad, rectangular patches, the area (and it is supposed to be inferred the thickness) of which he calculated with the aid of an intelligent and experienced mariner. It is reported that one litre of oil had spread itself out into a film about fifty-three millionths of a millimetre in thickness, and covering an area of 18,000 square metres or more.

Mechanical Progress.

The Harvey Process.

Mr. Hayward A. Harvey, the inventor of the method which bears his name, shortly before his death took out a patent dealing with improvements on it, says the *American Machinist*. Hitherto powdered charcoal has been employed as the material for snpercarburizing steel for armorplate. Several objections have, however, been experienced in its employment. These difficnlties are referred to as follows: It has been found necessary to deeply imbed in the powdered charcoal the metal to be treated, because of the tendency of masses of powdered charcoal to subsidence when heated. This has involved the employment of treating chambers of undesirably large vertical dimensions and corresponding increase in the height of the furnace chambers. Another difficulty has risen from the tendency of the finely powdered charcoal to fly off in dust stirred or moved from place to place, as it has to be when loading and unloading the treating chamber. It is also the fact that for some reason, the nature of which is not fully understood, when fine wood charcoal alone is used and is subjected to high heat, explosions occasionally occur. These explosions are forcible enough to blow off the cover of a closed receptacle, or if the receptacle containing the fine charcoal is not closed and the charcoal is covered with a layer of sand and a superposed layer of firebrick, a species of ebullition is observed to take place in the granular mass by which the mass is loosened so as to diminish the firmness of its compression against the steel which is to be snpercarburized. Mr. Harvey claimed to have overcome these difficulties by forming the carbonaceous-treating bed partly of finely powdered wood charcoal and partly of animal charcoal, using for that pnrpose the "spent char" from sugar refineries. The statement was made that 10 to 15 per cent causes an observable diminution in the quantity of dust arising, and that 40 to 50 per cent almost entirely prevents the escape of dnst.

What the Ferris Wheel Teaches.

In answer to the question of what the Ferris wheel represents in mechanics, Mr. Ferris recently said:

"I suppose you might consider it as typifying the present progress, the latest development of mechanical engineering. You know there are really two wheels—one bnilt 30 feet within the other. These are joined by truss-work, such as is used in our finest bridge construction. Beyond all that, the wheel develops to a degree hitherto never realized the capacities of a tension spoke. You know that the wheel is not only a perfect pinion wheel, but a tension wheel as well, and these, I suppose, may be regarded as its chief points. It is as perfect a pinion wheel as the little wheel that goes flicking back and forth in your watch. In all that immense diameter there is less deflection proportionately from a true circle than from the pinion wheel of the most perfect watch made. This is due to the fact that it has, instead of stiff spokes, the tension or jointed spokes. When I first proposed to build a tension wheel of this diameter, the feat was regarded as impossible. It was held that the spoke rods on the upper side of the wheel at any given moment, instead of snstaining the weight of the upper part of the wheel, would, from their own weight as they hung vertically, pull down that arc of the wheel which they bore upon, and thns cause the wheel to become elliptic. As a matter of fact, they do nothing of the kind. There is absolutely no deflection from the perfect circle."

Wire Shafts for Steamships.

Experiments have been made with the new plan of wire shafts for steamships, says the *Manufacturers' Gazette*, the result showing that when the shaft is in position and rotating stress is applied, a tensile force is exerted upon the individual wires and their several fastenings—each a unit of strength snstaining its part of the total amount of stress. The strength of the individual wires and of the fastening being known, it is practicable to ascertain the strength of the shaft as a whole.

Thns, if made for instance in five sections, its total length 100 feet and its diameter 15 inches, the shaft will have 25,000 No. 7 steel wires, each 25 feet long, with their 50,000 fastenings; each wire and each fastening will sustain a load of 500 pounds without rupture or injury, making a total inherent strength of 37,500,000 pounds, or 25 times greater in amount than the continuous force of an engine of 5000-horse power. A stress of 25 pounds only upon each unit of strength—each point of resistance existing in a wire shaft as named—will more than equal the force of such an engine.

Bottle-Blowing by Machinery.

The Ashley bottle-making machine at Woodbnry, New Jersey, appears to be a success. It had been claimed for the machine that bottles had been made quite complete, which had successfully been subjected to an internal pressure of 300 pounds to the square inch. The trial run at Woodbury has been very successful. The automatic principle has not been developed to the full extent in these machines, bnt it has been carried so far that one man and three boys —none of them necessarily skilled glass-blowers—can operate two machines, each of which is capable of turning out two bot-

tles a minute. The machine does not gather the glass. One of the boys, the "gatherer," is specially detailed for that service. He feeds the molten "metal" to the machine, in which it is mechanically molded, the neck and month formed, the interior blown by means of compressed air, and the finished bottle automatically delivered to a carrier which takes it to the annealing oven. There is unbounded room for improvement both in the performance and capacity of the machines. But the important step has been taken, and bottles have really been made in this country by machinery.

1200-Horse Power Turbine for Niagara.

Another immense water-wheel has just been shipped to Niagara Falls by James Leffel & Co., of Springfield, Ohio. It is a duplicate of and nearly the same power as one which was shipped some six months ago to the Cliff Paper Co., and is intended for the same parties.

The wheel is of the new type on horizontal shaft, and is known as the James Leffel double-discharge turbine, the entire weight being 30 tons. The water will be conducted to the wheel from a canal near the top of the cliff by an 8-foot pipe, extending downward until it reaches the mill, located near the foot of the cliff. The water will enter the cylinder casing of the wheel from below, passing upward a few feet, filling the case, and thus obtaining the head pressure.

The amount of head will be about 130 feet; the wheel being some 67 inches in diameter, a speed of 225 revolutions will be obtained, and almost or quite 1200-horse power developed. The runner is made bronze, with a very strong, heavy iron center, all nicely proportioned and designed, and the mechanical construction finely executed. The wheel will connect direct to the powerful wood-grinding machinery, obviating entirely the use of the gear or belts. The machines will be located on each side of the wheel, affording a very simple design and arrangement for the whole plant.

The only American design and pattern of wheels that are being placed at the new improvements at Niagara are manufactured by James Leffel & Co. The Leffel wheels already in operation there give so uniform and perfect satisfaction as to induce the parties to make the duplicate orders recently shipped.

The water-wheel company have just completed a very original and unique design of water plant for another New York company. It comprises four wheels in one system, being a quadruple wheel of 1000-horse power, to operate under a 40-foot head. Equally as successful results are contemplated for this combination of wheels as they are realizing from their Niagara water-wheel plants.

PRACTICAL TREATISE ON HYDRAULIC MINING.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Founded by Mathew Carey, 1785.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is berally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

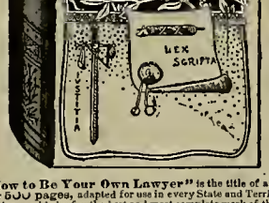
$1000 WORTH OF LAW

FOR $1.50.



"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

Useful Information.

Steel and Iron.

Here are the statistics, presented at a recent meeting of the British Iron Trade Association, of the relative increase of the iron production of the chief manufacturing nations within 15 years:

	Production of pig iron in the years	
	1887.	1892.
Country.	Tons.	Tons.
United States	2,066,000	9,157,000
Great Britain	6,608,000	6,616,000
Germany	1,614,000	4,793,000
France	1,453,000	2,023,000
Belgium	490,000	768,000
Austria-Hungary	400,000	935,000
Russia	450,000	915,000
Spain	43,000	179,000
Italy	24,000	12,000
Sweden	351,000	491,000
Other countries	60,000	90,000
Totals	13,559,000	25,979,000

While the world's production of pig iron increased in this period 91.6 per cent, Great Britain's production only very little more than held its own. In 1877 Great Britain contributed 48.9 per cent of the world's production of pig iron, and the United States only 15.3 per cent. In 1892 the relative position of the two countries is reversed, England contributing only 25.4 per cent, against 35.2 per cent for America. But, significant as these figures are, Great Britain's declining importance as a steel producer, as contrasted with her protectionist rivals, is even more illuminating. Here are the statistics for the production of Bessemer steel, covering nearly the same period:

	Production of Bessemer steel in	
	1878.	1892.
Country.	Tons.	Tons.
United States	584,000	4,168,000
Great Britain	762,000	1,501,000
Germany	390,000	*1,900,000
France	218,000	510,000
Belgium	75,000	*210,000
Austria-Hungary	97,000	*220,000
Russia	8,000	95,000
Sweden	22,000	*191,000
Spain	.....	130,000
Totals	2,106,000	9,825,000

*In these countries the quantities are only approximate, inasmuch as Bessemer steel ingots are not distinguished from finished Bessemer steel or finished Siemens steel.

In 1878 Great Britain was contributing 42 per cent, nearly half of the world's steel production, and the United States only 25 per cent. In 1892 it was the United States which was producing 42 per cent, and the United Kingdom only 15 per cent, or actually less than Germany. According to the English statistician, while the Bessemer steel production of Great Britain increased 97 per cent from 1878 to 1892, that of France had increased 134 per cent, that of Germany 387 per cent, that of the United States 680 per cent.

Over Three Million in One Day.

The transportation lines in the city of Chicago carried probably over 3,000,000 passengers on "Chicago Day," Oct. 9. The following figures are given by the *Tribune* for the most important transportation lines:

South side cable system	757,660
North and west side cable lines	765,641
Illinois Central	738,329
Alley Elevated	294,986

This makes a total of 2,556,416; and the traffic on the horse and electric lines in various parts of the city, with the travel on the various lines of steam railway which can be properly classed as city traffic, must have made the total number of passengers carried considerably over the three million mark.

Artificial India Rubber.

Artificial india rubber from cotton-seed oil is one of the latest industrial products, and claimed to possess commercial adaptations of peculiar practical value, says the *Tradesman*. The manufacture involves a process not yet given out to the public by the discoverer, who states that, while experimenting with the cotton-seed oil to produce a varnish for painting, he obtained a substance entirely foreign in its make up and properties to what was sought—not a varnish, but rubber. So simple is the process, as alleged, that it is not within the protection of a patent—the only safeguard being, therefore, in the secrecy of the process, by the use of which, it is asserted, only 15 per cent is required of the genuine rubber to produce an article which can in no way be distinguished from the ordinary crude india rubber, it is said, even by experts in the handling of the latter article. Arrangements have been made for its extensive manufacture and its application to the various purposes so long peculiar to the natural material.

Cost of Great Britain's Defenses.

The British empire spends as a rule upon defense from $250,000,000 to $280,000,000 a year, of which the military expenditure of India, with the indirect expenditure for the sake of India on mobile land forces at home, forms the largest item. Almost the whole of this vast sum is expended out of British loans or taxes under the control of the Parliament of the United Kingdom, and out of Indian taxes under the indirect control of the House of Commons through the Secretary of State, who is a member of the government of the day. The expenditure, although vast—although open to the reproach that it does not do more than maintain a fleet slightly superior to that of France, and an army of very small numbers—is a flea-bite as compared (in its ill effect upon the wealth of the nation) with the military expenditure of Italy, or, in a less degree, with that of other continental powers. The evidences of the overpressure of taxation in India itself, many as they are, are slight in comparison with those which are present in the case of Italy; and it may be assumed, therefore, that while the taxpayers of the United Kingdom and of India may make their voices heard in insisting upon better value for their money, the expenditure will not in itself be brought to an end by bankruptcy.—North American Review.

Interested in Beards.

Captain H. Bower, of the Seventeenth Bengal Cavalry, is one of the most recent travelers in that secluded country of Thibet, which, in all its barrenness, is gradually being made known to the West by the explorations of modern travelers. From an account which the gallant captain gave of his experiences in the country, at the Royal Geographical Society lately, it would seem that if ever Thibet should be opened up to trade, remedies for promoting the growth of the beard are likely to find a good sale there, for, according to Captain Bower, "anything like a decent beard is almost unknown in Thibet, and the natives expressed great admiration for the beards of the travelers, and wanted to know if they could supply them with any medicine that would make theirs grow."—American Druggist.

An Engineer's Smart Scheme.

An interesting story is sent to us telling how Mr. George Westinghouse, the millionaire inventor, obtained $1,000,000 when he needed it badly. When the Westinghouse Air Brake Company was a new concern, the directors gave to Mr. Westinghouse a paper vesting absolutely in his hands the power to fix the selling price of air brakes. The object was to cripple competitors. When the Westinghouse Electric and Manufacturing Company was in trouble, Mr. Westinghouse applied to the Air Brake Company for a loan of $500,000. His application was refused, and mention made of the fact that he owed the Air Brake Company $650,000. At the next meeting of the Board, Mr. Westinghouse produced the paper giving him the authority to fix prices. Its existence had been forgotten, and the directors saw the importance of gaining possession of it. Attorneys were consulted to ascertain what could be done. All said that the only thing would be to make terms with Mr. Westinghouse. Then he was asked what he would take for the paper. He said $1,000,000, stuck to the figure, and got it. The directors who refused the loan of $500,000, and then paid over $1,000,000, don't like this story, but its truth is vouched for.

Electricity.

Accumulator from Lead Dust.

An interesting circular has been issued by the Electricity Company of Gelnhausen (near Hanau, in Germany) announcing that they are now manufacturing a new accumulator, independent of existing patent rights, in which the active paste consists of the finest lead dust. This lead dust has been used with the best results as active material in the Khotinsky batteries, the patents for which are owned by the Gelnhausen Company. These negative electrodes require no formation. The exclusive employment of this lead dust for the positive electrodes as well, in the first instance presented the serious obstacle that metallic lead, even in the form of lead dust, on being oxidized to lead peroxide by the action of the electric current in presence of dilute sulphuric acid, expands in volume to such an extent that the pressure on the walls of the leaden electrode carrier causes the active material to fall out, and thus renders the accumulator useless. This obstacle has been completely removed in the following way:

The lead dust is mixed with substances which remain entirely neutral in the action of the accumulator, while, on the other hand, they are of porous structure, and yielding to such a degree that they afford the necessary space for the expansion of volume of the lead dust on its being changed into peroxide, so that a deleterious pressure is no longer exercised on the walls of the electrode carrier. At the same time the active mass in the accumulator is, as it were, firmly cemented together, and its failing out thereby prevented. The lead dust is now used as active material both for the positive and negative electrodes, while as electrode carrier a framework of compressed lead is employed which has given most satisfactory results, and is protected by a German patent. In this way, so the Gelnhausen Company claim, an entirely new accumulator has been obtained where both electrodes are made of metallic lead dust obtained by a process which is likewise protected by patent. This accumulator, therefore, claims to infringe none of the existing patents. The negative electrode of the new accumulator, as already mentioned, requires no formation whatever, while in the negative electrode the oxidation of the metallic lead dust to lead peroxide, in consequence of the much higher conductivity of metallic lead against that of lead salts, is accomplished most readily and most rapidly. The extreme porosity of both electrodes favors in a striking degree the thorough utilization of the active mass, as compared with those accumulators whose electrodes are filled with oxides of lead. At equal capacity the new lead-dust accumulator is stated to be of much lighter weight than those made of lead oxides, and its capacity per kilogram of electrode is higher than that of the latter. The chemical and physical properties of the new accumulator ensure it a longer life than that of accumulators made of lead oxides, while at the same time the cost of manufacturing, and consequently also the selling price, is cheaper.

Underground Electric Conduits.

In a paper read before the International Electrical Congress, Chicago, Prof. D. C. Jackson stated that four different varieties of underground electric conduits were at present in use in this country. These were cast of wrought-iron pipe, cement-lined sheet-iron pipe, tile, terra-cotta, or clay pipes, and wooden tubes. Of these, glazed terra-cotta was the most used, the sections being three feet long, and the ducts rectangular, and each capable of containing at least three cables. It was watertight and nearly gastight, and the glaze has a high electrical resistance. When laid in concrete the conduit should be laid with its top two feet below the pavement; without concrete at about three feet. The tile conduit was laid on a bed of cement from two to six inches thick. It was covered with concrete to a similar depth, so that when the whole had hardened it resembled a continuous set of stone ducts. Joints between the sections were made either by burlap strings soaked in asphalt, or more commonly by a tile sleeve cemented on. The simplest conduit used was wrought-iron gas pipe laid either bare in the ground or imbedded in concrete. The ducts were usually two or three inches diameter, the latter size accommodating four cables. The joints are made with screwed sleeves, and the pipes are usually 20 feet long. Experience shows that cables can be pulled easily round curves in these pipes of not less than three feet radius. When laid in concrete, the pipes are spaced about 1½ inches apart. When alternating currents are used, the out and return cables should lie in the same conduits to avoid losses by eddy currents and hysteresis in the pipe. Wood conduits were largely used in Philadelphia. The walls were about 1¼ inches thick, and the top was covered with two-inch plank as an additional precaution. The commonest kind was built of 4x4-inch pieces of wood with a three-inch hole bored through them. The wood was preserved with coal tar oil (carbolineum). The disadvantage of this system was the destruction of the covering of the cables by the preservatives used for the wood. The only type of conduit used on a large scale was the cement-lined iron pipe.

French Electric Locomotive.

Trials of the Heilmann electric locomotive have recently been made at Havre with, it is stated, satisfactory results, at least in so far as the ease and smoothness of running are concerned. This locomotive, says *Engineering*, consists in the principle of a steam engine driving a dynamo which supplies current to motors which finally effect the propulsion. The engine was tried on a stretch of line about 1¼ miles long, which contained curves of 250 feet radius and stiff slopes. The shortness of the run prevented any high speed being attained, but at speeds of from 20 to 25 miles an hour the running of the locomotive was remarkable. In shop trials the machinery has been run at a speed corresponding to 68 miles per hour. Trials of the combined efficiency of the engine dynamo and motors were made on the return of the locomotive to the shops, but the results of these have not yet been published.

Fast Time on Electric Road.

There is a likelihood that a high-speed electric railroad will be built between Brussels and Antwerp in time for the Belgian Exposition. The daily traffic requires 16 express trains each way on the present steam roads. The route is direct and practically level. It is proposed to run a single electric car, holding 60 people, every 10 minutes, and making the trip in 20 minutes, at a speed of about 66 miles per hour. This speed, it is claimed, could be safely doubled later on, but it is contemplated to begin with a more moderate speed, and to increase it later. The cost of the road is estimated at about $2,200,000.

The Telephone in Warfare.

Experiments were recently made abroad with a bimetallic wire, made up of a core of steel surrounded by a coating of copper, to show the practicability of use of the tele-

phooe in time of war. Reels carrying 10,000 feet of this wire can be easily carried by soldiers as a part of their equipments. The eotire apparatus necessary for a lioe one mile loog can, by the ose of this wire, be made to weigh ooly 5½ ponods. The wire is onwouod naked on the ground, the retnrn grouod circult beiog made throogh the operator or his horse in case he is mounted. Io actual trials made a short time ago, a line 14 miles long was laid in five honrs and taken up in one hour.

Electricity and Vital Energy.

H. Newman Lawrence draws the follow·ing conclnsions concernlog electrical aod chemical fuoctloos in association with hnman vitality: 1. All the thousand and ooe chaoges which take place in the struc·ture of the liviog body, he they due to the oever-ceasing and involuntary process of metabolism or to the exercise of function, or to the effort of will, partake of the nature of chemical chaoge. 2. All chemical changes are accompaoied hy electrical manifesta·tions. 3. Without chemical change and in·terchange life does not appear to exist. 4. Therefore, life is always accompaoled hy the generation of electricity. 5. Electrical eoergy, however, is not the immediate source of the vitallty of the body.

Heating Iron Rods for Nails.

The scope of electric heating apparatus is very wide in Norway. A furnace for the equal heating of the iron rods for the maou·facture of horseshoe nalls was required by the Norweglan trade, and Alexander Sie·mens, who stands among the first Enropean electrlcians, was commissioned to construct such a furnace. When completed it con·sisted of a hnge core of carbon, rendered in·candesceot by the passage of a large cnrreot at low voltage. The core was imbedded in sand to prevent escape of heat, and was itself hollow. An lron rod passed slowly through, and at once became red hot, the speed of pulling throngh regulating the heat.

Electricity in a Brickyard.

A progressive brick manufacturer in Anburo, Me., has arranged an electric motor to do the work of horses ln grindlng. In all yards where horses are used it ls an established fact that one of the greatest troubles experienced in the windlass and treadmill is the rapld decline of the horses, as the strain upon thelr shoulders is so great that they succnmb in a very short time. Other New Eogland manufacturers are adopting the use of electricity ln their plants, aod wlth such excellent results as to promise the opinion that lt wlll soon become uni·versal.

Making Things Talk.

A curious discovery ln science was lately reported in the *Electrical Review*. If a beam of sunlight be passed through a prism so as to break it up into rainhow tiots, and these be allowed to fall, one at a time, upon a glass vessel containing lampblack, colored slik or worsted, the vessel will give forth souods varying according to the fabric em·ployed and the color of the ray which strikes it. Every klod of material gives forth some souod to some color and ls silent to others.

Singular Combination.

A receot number of *Cosmos* describes a singnlar combination of reflectors for an electric lamp. A large parabolic reflector at the back projects the back rays of an electric lamp. In the front are four or five portions of parabolic reflectors in annular rings. The result is said to be surprising, and the inventor indicates this as a useful arrangement for colliery, tramway or other similar lamps. Sections and views are given of this oew lamp, which is the invention of G. Bellati, a colonel in the Italian army.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.
THE BEST NEWSPAPER published in the district is
THE TIDINGS,
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reach·ing the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.
H. S. SPAULDING, Publisher.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working pre·cious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientis nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Ma·terials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Orucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Cop·per Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is re·placed by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Midwinter Fair Exhibit.

The following address has been issued:

The Executive Committee appointed by the California Miners' Association at the last convention, for the purpose of supervising the State Mining exhibit for the Midwinter Fair, is perfecting arrangements as rapidly as possible, and expects the co-operation of the committees appointed in the different mining counties. These committees should act in conjunction with the Executive Committee in San Francisco, which latter has sole control of the general arrangement of the exhibit.

The Midwinter Fair Commission has granted free to the Executive Committee ten thousand square feet of space in which to make the proper representation of the mining industry, but they wish it all made in thet space. If special mining or mineral exhibits by separate counties, individuals or corporations are made elsewhere, the necessary space must be obtained from and will be charged for by the Midwinter Fair Commission, which fact should be understood by the county committees. In the space already set aside for the general State Mining Exhiblt, allotments will be made to the counties without charge, and they will be allowed to make their own installations, if so preferred. These, however, must he under the supervision of the Executive Committee, so that there shall be a harmonious whole when completed. The space heing limited, the exhibits must be compactly arranged, aod upon one general plan, for which reason the Executive Committee reserves the right of supervision.

The Executive Committee will be prepared tn give receipt for all articles sent to the exhibition. Safes will be provided for valuable specimens, police protection given, watchmen will be employed by day and night, and every possible care taken of articles on exhibition, but the committee can assume no finaocial responsibility in this connection.

Counties making separate installations must provide their own cases for specimens, etc.; but if articles are sent directly to the Executive Committee, showcases will he provided. It ls expected that each county, at its own expense and for its own benefit, will provide a competent representative, who shall not only have care of its exhibit, but be able to describe the mineral resources of the section.

The exhibits of ore, quartz or other minerals for the Mining Department will he transported both ways free of charge hy the Southern Pacific Compaoy, it being understood that the same are for exhibition only, having no commercial value, or, if valuable, not heing intended for sale. It is understood that if any lots of ore are turned over to the smelter, or otherwise disposed of commercially, the company shall be guaranteed regular freight rates on the same.

The county committees are urged to make as much haste as possible in their collection of exhibits, and promptly inform the Executive Committee of the space required. The Executive Commlttee reserves the right to so arrange the space at command as to allot it in proportion to the importance of the display.

EXECUTIVE COMMITTEE.

—The contractors in charge of the tunnel and other work at San Luis Oblspo have shipped a lot of men from this city to that point and the evident intention is to push the work to completion as soon as possible. Several weeks ago a large reduction was made in the working force and this is the first intimation of the intention to put on an increased force. It is said that more men will be taken down next week. There are seven tunnels to he pierced. The grading alone will cost $1,500 000. When this link is finished the hardest portion of the road will be completed, and the work of closing the gap between Elwood and San Luis Obispo will be carried along as rapidly as possible. Two thousand men are to be employed.

—To remove the piles from Stockton channel, contractors are using dynamite.

Coast Industrial Notes.

—Oregon is shipping apples to Texas.

—Many cars are loading walnnts in southern California for shipment East.

—Placer county fruit men in the vicinity of Penryn have decided to organize.

—The Spokane, Wash., City Council are discussing the question of abandoning electricity for gas ln street lighting.

—A petition is being circulated in Sutter Creek and vicinity asking the Supervisors to purchase anotber macadamizing machine.

—The editor of the Needles *Eye* recently went to Vanderhilt mining camp, and returns convinced that its future is most hright.

—Work on the San Pedro, in Victoria harhor, under the new plan to raise her, is progressing, but the repairs to the cofferdam are not completed.

—The people of Nevada City and Grass Valley are considering the advisahility of rehuilding the grand stand and stables recently hurned at Glenbrook race track.

—The last rain in southern California was more injurious to crops than was supposed. Much ot the second raisin crop was spread and in some vineyards this crop was ruined.

—Stockton police officers are indignant at an electric street-car line that has made a rule compelling members of the force to ride on the front platform or pay regular fare. They refuse to ride at all now.

—Enterprising citizens of Washington have tried the experiment of shipping apples and pears to China and Japan. In every instance so far the fruit has reached its destination in good condition.

—It is reported that southern California capitallsts are considering a proposition to locate a beet-sugar factory at Stevens, on the Asphalto branch of the Southern Pacific line, north of Buena Vista lake reservoir.

—The Spokane (Wash.) County Commissioners have sold $300,000 courthouse and funding bonds for par, the accrued interest and a premium of $3427. Theis & Barrol made the highest bid and got the bonds.

—The Escondido, Cal., irrigation district directors have contracted for the Woods valley for a reservoir site for the district; the price stipulated in the contract was $9,000 to be paid for in irrigation district bonds at par.

—The Picacho Gold Mining Company's pumping plant cost, with the 11-inch pipe line, which is five miles in length, $155,000. The mines are situated 500 feet above the pumps, which are on the hank of the Colorado in San Diego county.

—The total registered tonnage of the wheat ships that have left Tacoma (Wash.) since September 2d, those now there loading and waiting for cargoes, and those known to be on the way to Tacoma from foreign ports, amounts to 440,191 tons.

—The Northern Pacific railroad has hauled an average of 600 cars of shlngles every month so far of the present year from Puget sound to Eastern cities, and 200 carloads a month for the same time have been shipped by water to Hawaii, Australia, South America and Europe.

—A Vancouver, B. C., paper announces that the Great Northern Railway will extend its telegraphic line from South Westminster to Vancouver, giving Vancouver a competing line. A local representative says that the scheme is contemplated, though he has had no official notice.

—Vancouver people will pray the dominion parliament for lower duties on mutton, pig iron, telegraphlc cables, and abolition of duties on wheat and natural products, with a rebate of dutles on iron and glass when exported as manufactures. Reciprocity with Australia will also he asked.

—The cootractors boring the new gas well at the Stockton Insane Asylum are io difficulty. A large iron roller became detached from the apparatus and dropped to the bottom—1780 feet below the surface. They are now trying to move the obstruction to one side so that work can go on.

—President Blake of the Nevada Southern Railway, makes the statement that the road will be at once extended with all the energy and dispatch possible to the coal fields of southern Utah. The company have secured the right of way and the means to carry its road for 150 miles farther than its present terminus, and that will bring the cars into the center of the coal fields of Utah.

—An English company is buiding a pipe line from the Colorado river to Picacho, a distance of five miles, to wash placer ground, says the Tombstone *Prospector*. That district is very rich in gold and there is an abnndance of water in the Colorado river to wash out acres of placer ground. There is no reason why the scheme should not prove a success.

—Contracts for building a new ward building for the State Insane Asylum at Highland have been awarded as follows: Masonry and iron work, etc., to Rilley & Loane of San Francisco, $48,000; carpenter and plasterers' work, etc., to Dewar & Chrisholm, $19,354; plumbing and gas-fitting to Byrne & Drew of Redlands, $6650; galvanlzed iron and tin work, $4100, to C. A. Earhardt of Los Angeles; painting to George Stephens of Los Angeles, $1385.

—The Superior Court of San Bernardino county is now occupied in the trial of the Artificial Stone and Improvement Company, against the owners of the property fronting on First, Second, G, F, C, D and E streets to enforce a lien created by the construction of the sewers five years ago. The defendants claim that the sewers were laid in a faulty manner and that the Board of Trustees acted without authority of law in ordering the sewers laid. About $75,000 is involved in these suits.

—The Southern Pacific is getting ready to put into effect a new local freight schedule which will be a radical departure from all the schedules heretofore in force. The new schedule means the practical adoption of the western classification, which makes a uniform classification of articles and fixes a uniform rate hased on mileage. There will be some modifications of the western classification, made necessary by exceptional local condltions, but in the main it will be followed.

—The creditors of I. Brownstone & Co., merchants of Selma, Fresno county, have petitioned the Superior Court to declare the firm lnsolvent. The petitioning creditors and the amounts alleged to be due them are: P. Berwin & Co., $2265.05; Esberg, Bachman & Co., $564.35; Sachs Bros. & Co., $577.99; G. M. Kutz & Co., $669.56; Murphy, Grant & Co., $625.26. A similar petltion has been filed against I. Brownstone & Sons of Sanger, Fresno county. The petitloning creditors and their claims are: Sachs Bros. & Co., $939 65; G. M. Kutz & Co., $1161.57; A. & T. Weil & Co., $967.54; M. Franklin & Bro., $641.72; Murphy, Grant & Co., $108.41.

—Passenger rates East have taken an upward turn, all of the schedules applying to the World's Fair business having expired. For absolutely continuous trip first-class and second-class tickets from San Francisco, San Jose, Los Angeles, San Diego, or other California points usually taking San Francisco rates, are as follows:

	First class.	Second class.
Chicago	$57 00	$52 50
Chicago, via New Orleans	72 50	52 50
St. Louis	52 00	47 50
Memphis	55 00	47 50
New Orleans	62 85	47 50
Cleveland, Ohio	67 00	61 25
Cincinnati, Ohio	61 00	56 50
Cincinnati, via New Orleans	67 00	56 50
Chattanooga, Tenn	64 00	56 15
Montgomery, Ala	64 00	52 50

—Schacht, Lencke & Steiner, commission merchants at 16 and 18 Drumm street, last week called a meeting of their creditors for the purpose of asking for an extenslon of time. Their principal business consists in buying and selling dried fruits, honey and mother-of-pearl shells, and in shipping cascara bark to Germany. The assets are close on to $110,000 and the liabillties do not exceed $84,000. Among the financial assets of the company are 20,000 shares in the Ybarra Gold Mining Company of Calmilia in Lower California, a stock company incorporated for $1,000,000, there heing 100,000 shares at $10 each. The assets include a secured claim for $40,000 against the mining company for goods furnished during the past two years.

—At a recent meeting held by the Stockton real estate men and property owners, a committee was appolnted to draft a petition asking the Supervisors and City Council to call a bond election to vote $350,000 bonds to build a ship canal through the tule land from Stockton channel to a point on the San Joaquin river, 12 miles below the city. It was explained that at the time of the survey it was thought to be almost impossible to build on account of the great cost. The cost has been reduced by the construction of large, powerful dredgers, which work so cheaply that, in the opinlon of the city surveyor, the canal can now he built for $350,000. A canal can be built over the indlcated course, 120 to 125 feet wide on the bottom and 150 to 200 feet on top at the cost stated. Dredgers can now well afford to take the contract at 2½ cents per cubic yard, while in the days of engineer Alexander the estimated cost of the digging was 17½ cents per cubic yard.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ON THE 800 LEVEL.—*Ledger*, Oct. 27: The nndergrnond force of the Gover was pnt to work at the 800 level last week during the time the shaft below was being repaired. A small seam of rock which showed a trace of gold waa followed up with astonishing results. The seam has widened out to four feet end is full of minerel.

The new blecksmith shop at the Kennedy is aboot completed. The workmen will move into and occnpy it during the comiog week. The new building at the south shaft has been commenced, and as soon as it is possible to get around to the work a new gallows frame will he erected. The intention is to place the rock-breaker at the sonth shaft elevated so that a chute will cerry it to the mill. The rock from the north shaft will he ruu to the south shaft in cars end elevated to dump in the rock-breaker.

Butte.

A CLEAN-UP.—*Mercury*, Oct. 28: Sopt. L. L. Myers of the Spring Valley mine at Cherokee errived in town to-dey at noon, having in charge a gold bar valued at $11,000. It wes placed in the express office for shipment to the Mint. The bar is the result of a clean-up of a company of Portuguese who have leased grouod from the company aod have been drifting it out. This emount is the result of several months' run.

The Spring Valley mine is yet one of the richest mines in the State. The decree against hydraulic mining and litigation have kept it closed down for several years. It will never be worked by the hydraulic process again, yet the mine is still rich. It is only a question of time when it will be reopened as a drift mine. The gold is there, and it will eventnally have to come out. Theo Cherokee will boom as it did in days of yore.

A FINE NUGOET.—Chico *Enterprise*, Oct. 20: This moroing there was brought to the Bank of Butte County from the Contolenc mining section, above Magalia, a fine nugget of gold weighing 10¼ ounces, and valued at $180. It was brought to town by Mr. Contolenc as a small specimen of what the mines in that section of Botte are turning out.

Calaveras.

MINE BONOED.—*Chronicle*, Oct. 27: The Starlight mine, owned hy Chas. Werle of this place, and sitoated in Chili Gulch about two miles from here, has been bonded to Jacob Powley, C. W. Watkins and W. L. McCrey. Active operations will commence at the mine next Monday. A new teo-stamp mill will be erected at once.

El Dorado.

COMPLETED.—*Republican*, Oct. 26: The chlorination works at the Oro Fino mine have been completed and are in operation by Laoe & Hayward. These veteran miners appear to find encooraging developments in the mine as the work advances, for everything so far coustructed ahout it is done substantially and with a view toward permanency. The ore is said to he improving as greater depth and extension is reached, and, if the preseot good prospects continue, the mill, which now comprises 20 stamps, will he enlarged to 60 or 80. There is an extensive helt of low-grade ores extending north and south of the Oro Fino, and, if the present venture continues to he successful, this county may eveotually contain some of the largest milling plants on the coast.

Nevada.

SALE MADE.—The *Union* is reliably informed that arrangements have been completed for the sale of the Stockbridge and Great Britain claims on Massachnsetts Hill to Jas. D. Hague, Esq. In spring, operations on a big scale will he in progress at that place.

STARTED UP.—*Transcript*, Oct. 26: The new hoistiog works at the Home mine, on Deer creek, were started np this forenoon. Charles Stepp, treasurer of the company, and A. Goetz, one of the directors, arrived here last night so as to he present when the machinery was started. A collation was served at the mine and the occasion duly celebrated. To-day was the time set for lettiug a contract to sink the shaft 100 feet.

At the Champion mine the large new hoisting machinery was started up to-day, the event oeing the occasion of considerahle jollity among the owners and employes. The ponderous machiuery works very smoothly.

BOUGHT A MILL.—*Transcript*: The company that recently located an extensive quartz deposit on Sweetland creek have arranged to huy the mill at the Red Chief mine in Sierra county. Thomas Dillon went up to close the hargaiu and to superintend the removal of the mill.

GOON GRAVEL.—Virginia City *Chronicle*: A friend visiting from Nevada City says that some very good gravel is coming out of the second side drift in the Centennial miue, which will pay well for washing when the company gets ready for it. The gravel hed is thicker, with coarser wash howlders, and heavier gold than the front channel. It is proposed to get in the lomher for sluices, shortly. The Centennial is considered chief among the gravel mines of the famous ridge.

MINING PROSPECT.—*Telegraph*, Oct. 28: Down at Shehley's ranch there is a fine prospect. Mr. Shehley has a ledge ahout four feet in width and he has sunk a shaft 40 feet deep upon it. The quartz is encased in slate and serpentioe, and

gold is sprinkled tbrough it. A novel piecs of machinery is placed on the prospect. It hoists and pumps separately or collectively, and is mads from tbs several portions of mowing machines. Mr. Shebley, and Robert Scanlan, who is associated with bim in tbe mining ventnre, tbink tbey have a prospect that bids feir to becoms a dividend payer.

To START UP.—*Transcript*: The Fountain Head and Cold Spring gravel mines ere located on tbe Washington ridge, near the Hermony mine. In years past considerable work was done in the Cold Spring and some rich gravel taken out, but it wes found that ths company's sheft was too low down on the ridge and operations were suspended. The face of the inclins is in bedrock, tbe natnral raise of wbich is toward and into the Fountain Head. On tbe Fountain Head grounds hoisting worke havs been erected. It is the intention to consolidate these two claims, which will give 8000 feet along tbe course of ths true channel. The results in the Eest and West Harmony mines demonstrate beyond a doubt the existence of valuable gravel deposits for miles along ths ridge.

RICH GRAVEL UNCOVERED.—*Transcript*: A gentleman who came down from the San Jose gravsl mine informs us that splendid gravel was uncovered in that mine a few days ago. On Thursday last they found a nugget worth $7, and on Friday one worth $4, and the gold in the gravel indicates that they have got the genuine rich channel which they have beeu running for dnriug the past three or four years. Now that they know juet where it is, it will not be long before that company will be on velvet. They own a large extent of territory, and the indications are that it ruus through their entire property.

MINING NOTES.—*Transcript*: The Odin is looking fine and it is believed that they have levied their last assessment.

In the course of three weeks the mammoth machinery of the Champion will be ready to start np; it is the heaviest in this part of the State.

Nothing but good news comee from the Providence. The ledge continues to enlarge and the rock is all of very high grade. The outpnt of bullion from the mine this mouth will he between $20,000 and $30,000. The five men who own this mine are those who are going to build tbe electric railroad betweeu this place and Maryeville.

Iu the morning and at evening, miners, with their dinner buckets, can be seen in squeds going and coming from work in all directions. It is a pleasing sight, showing as it does the large nnmber of men employed in and about the mines of thie district at the present time.

The tuunel at the Harmony mine is nearly completed, and, as an old miner said after going tbrongh it, "if they have not got the biggest and richest gravel mine in the State, then I'm the worst fooled man in the world." Bullion in large quantities will soon be coming out of that mine. It is there. The company ie now employing abont 30 men.

The Pittsburg mine has at lest a fine show of becoming a handsome piece of property. The principal portion of the etock of this compeny is now owned by San Francisco parties. A short time eince the tributers there went to work on a small ledge of inferior rock and now the compeny ie working it and they have a foot-and-a-half ledge of as good-looking rock as was ever eeen in the mine.

There are over 600 men at work in the mines in this district. In this estimate we do not include the nnnsually large nnmber of prospectors. The mines have all the men they want, and it ie no place for miners to come to from abroad with the expectation of getting work, ae none can be had.

Placer.

HYDRAULIC MINE TO START.—Colfax *Sentinel*: E. C. Uren surveyed for a eite for a dam in Little Bear river between Dutch Flat and Liberty Hill last week. This dam ie to be built to receive the debrie from the Polar Star mine at Dutch Flat, of which John Speulding has control. As Little Beer river has not a very large watershed, it will be comparatively easy to make a wasteway to carry all the water that comes down during the winter. The site is such that, no matter how high the dam is raised, the new wasteway can easily be made. Besides, the site will afford the imponnding of more debris than can be washed from the Polar Ster mine. It is not expected that the Debris Commission will refuse a permit, as it is intended to bnild a good, enbstantiel dem. This eite is not far from the Liberty Hill dam, which has stood the test of ten yeare time and is more secure to-day than ever. A curious feature of the Liberty Hill dam ie that already natnre has hastened to make it doubly secnre by sending up a perfect row of alder trees on the inside of the dam along the rock well. The trees have already attained a height of over 25 feet, and are growiug so closely together as to make a perfect bulkhead in themselves. Other treee are eprouting up in the dam, and, where once there wae nothing but barren tailings, in a few years there will be a fine little forest.

GOOD CLEAN-UP.—*Herald*, Oct. 27: From 34 tons of ore recently taken out of the Morning Star mine by Sam Kaiser and Will Till, they cleaned up $1500, or about $44 a ton. The Morning Star is owned by Otto Walters of Opbir.

Ben Hawkin is fixing up the Eclipse mill for the purpose of cruebing the rock on the Eclipse dump. He hauled 17 tons to the Ophir mill and realized from it $500.

The Moore mine has made another clean-up, this time from $1500 to $2000. This famous property is keeping up its record in fine shape.

The old buildings at the Green mine are being removed.

The Boulder miue at Ophir, the property of L. Ferguson and E. H. Huchison, is starting up. The hoistiug worke will be completed the coming week, and an eight-stemp mill is being erected.

Plumas.

WILL START UP.—*National-Bulletin*: Messrs. Jas. O'Brien and A. B. White returned to San Francisco on Saturday after spending a couple of days at Spanish Ranch looking after the interests of tbs Qnincy Mining and Water Co. Both gentlsmen are directors of the company. Mr. Whits being tbe superintendent. Tbe latter gentlemen will retnrn to Spanish Ranch in a few deys and rsmain till winter sets in. The work of getting their property ready for operation will bs pushed with all possible energy. Uuder the management of Assistant Supt. C. R. Thompson, work on the big ditch, reservoir and the sawmill has been progressing rapidly, and it is probable that the erection of a large reetraining dam will begin in a very short time. Over 60 men are now employed by the company, and ths Spanish Ranch country now preeents a lively appearence. Undoubtedlv, the Qnincy Mining and Water Co. controls a large amount of the best mining ground in Plumas, and will be amply rewarded for the big outlay of money now being made. The placers in the vicinity of Spanish Ranch have yielded np their hundreds of thonsands in years gone by, and there yet remains a large aree of nntouched gravel deposits which, in consequence of plaus now maturiug, will prodnce as mnch more.

NEW ENTERPRISE.—*National-Bulletin*, Oct. 19: During the past summer the Northern Placer Mining Company did qnite a lot of work on their extensive miuiug property uear Cromberg, building a reservoir at the head of Little Long Valley creek and constructing three and one-half miles of ditch and the necessary finmes to conduct the water to the large body of gravel which it ie desigued to wash. From Mr. E. J. Sugden of Pittsbnrg, Pa., who is president of the company, it is learned that uuder the snperintendency of Mr. Trayner the property is being pnt in good shape for active operations next year. It is the purpose of the company to build restraining dems, though, cousidering the location of the property, snch work could hardly be deemed a necessity. The gravel bed is of a large extent and from it it is believed that much wealth will be obtained.

San Bernardino.

SLIDING SCALE OF WAGES.—Hawthorne *Bulletin*. Peter Hattou (Shorty) writes as follows from Calico, San Bernardino county, to a friend in Hawthorne:

I am working every day, but the weges are small. The miners are working on this sliding scale:

	Per ounce.	Wages.
When silver is	50	$2.00
Silver	70	2 50
Silver	80	2.75
Silver	90	3.00
Silver	1.00	3.50
Silver	1.25	4.00

At present wages are $2.50. This is a good plece to work. There are three mines working and they employ 200 men.

Siskiyou.

GOOD AVERAGE.—*Journal*, Oct. 25: The Greenhorn blne gravel mine etill continues to yield good returns, averaging abont $100 a day, with only two pickmen, the water supply being too light to pnt on a large force. As soon as winter rains increese the water supply, several more men cen be put to work at advantege.

Garvey, who owns the ranch on the Yreka eide of Greenhorn, hes been sinking a well for water to irrigate his land, and is finding good prospects, which may induce him to cerry on miuing operations also with essurence of good success. W. M. Thomas, of Greenhorn, showed us a piece of quertz about half as large as a man's fist, which seemed to be nearly half gold. and worth probably $50. He is making an effort to find the ledge where this float piece ceme from, which he expects will prove a rich bonanza.

The Spangler Bros., at mouth of Humbug creek, have commenced drifting, in order to strike the pey channel, when they will start up the machinery again to meke an open cut.

IDAHO.

IN THE COEUR D'ALENES.—Spokane *Review*, Oct. 18: A. P. Wiuslow, of Wardner, is in the city. Mr. Winslow is manager for the Inland Telephone Company of that place. "There are still 180 men, or abont that number, working on the Bunker Hill and Sullivan," said Mr. Winslow, "end I should estimate the number of idle men in the town anywhere between 400 and 600. Laying off the night shift tbrew 100 men out of employment. If the Last Chance case is ever decided so that work can begin on it, that in itself will he a big thing for the town. The Last Chance has rich ore end is in a good position to work it economicelly."

MONTHLY REPORT.—Idaho *Nugget*: Following is a eynopsis of the manager's report to the DeLamar Mining Co., for the month of September, 1893:

No. of tons crushed	3,353.45
Value of bullion produced	$81,052.52
Ore shipped	5,000.00
Miscellaneous receipts	708.97
Estimated profit	$47,295.27

GOOD PLACERS.—Wood River *Times*: Reuben Clayton is confident that, after 15 years of prospecting, he has at lsst caught on to a good thing. He has located and opened 80 acres of placer ground at the head of Little Smoky creek, just above the claims that Newton Revie has worked during the past 20 years.

He has already opened the ground, got water upon it and extracted five ounces of gold in a few daye' trial rnn. All he needs now to work steadily is to pipe the water, as by running it in open ditchee he will lose too much of it and cannot control it. The eeason being too far advanced to begin plecer-miuiug operations, he will doubtless wait until spriug before putting in his pipe; but with the opening of the season he will begins washing, and looks forward to making quite a clean-up next year.

Dan Tobill, and "Uncle" Wilson, tbe well-known prospector who was one of the owners of the Hnb at Era, and the Black Spar at Muldoon, are interested with him, and the tbree of them will be able to handle tbe property without hiring over two or three men.

OREGON.

THE GOLDEN FLEECE.—Ashlend *Tidings*, Oct. 27: Tbe Huntington mill for tbe Golden Fleecs mine arrived last week, tbe building for its occupency is coustructed, and the water wheel whicb ie to furnish power to rnn it is being set in place. Dr. Flanagan and Messrs. Shannon and Hill, who were at the mine Wednesday, report that they hope to see the mill running in two weeks.

The prospect of a successful issue of this new enterprise hes turned attention of mining men to that locality, and the lands adjacent to the claims of Shannon & Hill are looked npon with covetous eyee. Mrs. Kilgore, who owns the 22-acre trsct including the buildings and orchard of the old Hammond or Rockfellow place, has given a bond upon it to Mr. Hough for 30 days, the price being $4500, $100 being paid down to secure the bond. Postmaster Hammond, who owns 80 acres higher on the hill, has also given a short bond on it to other perties.

Lon. Edwards has his men at work at the Hope mine, which was bonded a short time ago by Gnnd & Edwards. They ars cleaning out tbe old prospect shaft at a point near the dividing line of the "Hope" and "Shorty" claime. The shaft was filled up with waste by the men who worked the miue last. After it ie cleaned out and retimbered it will be sunk deeper npon the ledge, in prospect work.

W. W. Walters went over to Sawyer'e Bar the first of the week, to pnt J. M. Harney and another man at work upon a mining claim in wbich he is interested with a San Francisco party.

Mr. Dnun, a geologist employed by the California Stete Miniug Bureau, hae been tracing the famous "blue lead" up throngh Californiia from the mining connties in the central part of the State through the northern counties to the Siskiyon monntains. At Klamath river he fell in with C. B. Jilson, the original blue lead discoverer and proprietor of the Siskiyou region, and in company with Mr. Jilson came over to Ashland Tuesday evening. Theory and surface indicatione trace the blue lead under the Siskiyou mounteins into this valley, but as this is ontside of Mr. Dnnn'e territory he did not put in any time at explorations here.

A GOOD RECORD.—Baker City *Democrat*, Oct. 23: The time ie rapidly approaching when prospect work on the mountains end placer mining in the gnlches must close until the snow disappeare in the spring.

The eeason just closing has been a most prosperous one for this section and generally epeaking there is no ground for complaint. When the great depression spread its dark shadow broadcast over the land and the cry of hard timee was heard on all sides, onr minee came to our rescue, producing the yellow metal in goodly qnantities and there was no stegnation felt in Baker City.

Our quertz miners will continue operations all winter and the work that will be accomplished before spring will add not a small nnmber of well developed properties to our already large list.

All of our bnllion producers, which have eent in regular ontpnts for many months past, will keep on producing during the winter mouths with their usual forces.

TO CRUSH ORE.—Jacksonville *Times*, Oct. 27: Ezra Poppleton and H. T. Bishop, of Tacoma, are making preperations to crush the ore from the Owene mine in Jackson Creek district and have alreedy shipped machinery from Tecoma, which is expected here soon.

Wallace Rogers and A. J. Jackson have nneerthed a three-foot ledge near the Shennon & Hill mine, which promises to be very rich. The first assay on the surface went $17.50 to the ton. A force of men are at work and if the ore ie as rich at a depth of 25 feet a mill will be put in.

A hydraulic giant will eoon be put in at the Illinoie Mining Co.'e claim in Althouee district, Josepbine county. They have some rich ground tbere and intend to work on a large scale. The claim was worked in eerly days by a couple of Germans, who took out eeveral thousand dollars, and, being satisfied with their haul, left the country. H. L. Doney end Dr. J. M. Teylor found the old workings, while on a prospecting tonr in July last, and waehed out some rich dirt and found some good-sized nuggete.

A NEW MILL.—Baker City *Democrat*: The Marotte mine at Sparta is developing into a promising property, from all accounts. It is owned by Mr. Geo. W. Robinson, of Detroit, Michigan, and is under the mauagement of Mr. John Thomae, the well known practical miner.

Mr. Thomas is in receipt of a letter from Mr. Robineon in which he is authorized to close the purchase of a mill for the property, arrangements for which were partially made before Mr. Robinson weut East.

The mill being negotiated for is a ten-stamp plant owned by John Ruth at Ruthbnrg, Idaho. Mr. Thomas will proceed at once to prepare the mill for removal to Sparta.

TRAIL CREEK PLACERS.—Baker City *Democrat*: Messrs. Joseph Tbibodo and Earnest Nadeau, owners of the Trail Creek placer mines in Granite district, have arrived in this city. They brought in with them 122 ounces of gold, or about $2000, the product of the mines eince a former cleanup made a few weeks ago. The gold was deposited at the First National Bank for sbipmeut.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 10, 1893.

506,356—WATER PIPES—Bedbury & Badgley, S. F.
506,493—PRESERVING WOOD—F. Hall, Tacoma, Wash.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of especial mention:

BINDING ATTACHMENTS FOR SEWING MACHINES. Chas. L. Tarr, Petaluma. No. 506,888. Dated Oct. 17, 1893. This inventiou is for the purpose of applying binding to the edges of goods in a mechauicel manner and without the assistance of an attendent. It consists of a guide and tension device through which the binding material is delivered from the roll to the biuder proper. The materiel firet passes between the adjustable tensiou rolls and thence to a guide, which folds the edgee of the material over eo tbat it ie in coudition to pass directly into the biuder when it is applied to the goods.

TRAVELING HARVESTER. — Benjemin Holt, Stockton, Cel. No. 506,877. Dated Oct. 17, 1893. The object of this inventiou is to provide an extended and self-adjusting bearing for traveling harvestere whereby the weight is better supported upon soft and yielding surfaces, and the tractile force is much increased in cntting heevy grain. It conciets of eupplemental bearing wheels and frames in which they are journaled so as to act in conjunction with the main wheels and provide an extended beering surface when traveling over soft gronnd. These wheels have also driving cbains or gear by which their power is added to that of the main wbeele to drive the cutting and other mechinery, end clutch mechanisms wbich allow them to travel at different rates of speed iu turning cornere.

SIDE-HILL VEHICLE.—No. 507,370. Deted Oct. 24, 1893. Christian Koenig, of Secramento, Cel. This vehicle, as its name implies, is adapted to travel on side hills. It can be readily couverted from a two into a three-wheeled vehicle. It has a pivotally mounted axle, adapted to be rocked in the direction of its length, whereby the wheele are thrown out of the same horizontal plane, in order to enable the vehicle to move conveniently over sloping ground. This movement of the axle is effectsd and controlled by the driver by meens of suitable connections within reach. The front of the vehicle is eo constructed as to readily permit the plecing end the removel of a third wheel whenever desired.

LUBRICATOR.—No. 507,409. Dated Oct. 24, 1893. George W. Boyd, of San Francisco, Cal., assignor of one-half to Findley Buchenan and Petrick H. Buchanan, of seme plece. This is an improved lubricator of tbat class in which the lubricaut is contained within a cup and is forced out by means of a spring-actuated plnnger carried by the cap and operating within the cnp, the plunger being controlled by an exterior nnt npon its stem. The particnlar improvement lies in a valve in the plunger, which operates automaticelly and hes the function of providing for the admission of air to tbe cup when the plunger is relieved from its pressure upon the lubricant, for any purpose, as for refilling, thereby avoiding the back suction, which is disadvantageous in that it witbdraws the lubricant from tbe journal, leaving it dry.

DOUBLE-ACTING HYDRAULIC ENGINE.—Frank Bernardi, Mokelumne Hill, Cal. No. 507,405. Dated Oct. 24, 1893. This engine consists of a cylinder having proper inlet and discharge passages and a piston operating in tbe cylinder; an oscillating valve controls the passages and this valve ie actuated by a longitudinally slotted rocking lever engaging the valve etem. Catches at each end hold the rocking lever at the limits of its movement. The lever is connected with the piston rod, and the latter carries a traveling contact which alternately releases the catches. This engine is a eimple and efficient one for working by means of water under head or pressure, and for transmitting its power to other machinery.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 2, 1893.

The repeal bill is now a law, and silver has suffered a sharp decline—not so serious, however, as that which followed the closure of Indian mints to free coinage in June. Silver in June was down to 62 cents; in London the lowest price was 30⅜d. It is a curious circumstance that the imminent repeal of the purchase clause had no effect upon the London market until last Monday, while the decline in New York began nearly a week before. The silver purchases under the old law have ceased. The last offering to the treasury officials occurred yesterday, when 70 cents was asked for 30,000 ounces and 68.25 offered and refused.

Copper and lead have been weak.

Silver in October.

At the beginning of October, fine silver was quoted at 34⅛d in London and 73¾c in New York. These were the best prices for the month, and lasted only for a single day. The other extreme was reached at the close of the month, when the price was 31⅛d in London and 68c in New York. The extremes in both for the first ten months of the year were as follows:

	London		New York	
	High.	Low.	High.	Low.
January	38 9-16d	38 2-16d	84 c	82½c
February	38 8-16	38 2-16	84⅛	83¼
March	38 6-16	37 9-16	83⅝	81⅞
April	38 5-16	37 14-16	83¼	82½
May	38 9-16	37 8-16	84⅛	82¼
June	38 12 16	30	83¼	62
July	34 12-16	32 2-16	75	69
August	34 12-16	32 11-16	75⅛	70¼
Sept.	34 8-16	33 14-16	74⅞	73
October	34 2-16	31 8-16	73⅞	68

In October, 1892, the extremes in London were 39 14-16d to 38 2-16d, and for the first ten months of that year 43 12-16d to 37⅜d.

Coinage of the Local Mint.

The October coinage of the San Francisco Mint compares as follows:

	1892.	1893.
Double eagles	$1,400,000	$1,362,000
Half eagles	412,500	280,000
Standard dollars	100,000	.....
Dimes	.....	80,000
Totals	$1,912,500	$1,720,000

Silver and the Metals.

NEW YORK, Nov. 2.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.
Thursday	33½	72¼	....	....	.....
Friday	33¾	71¾	9 40	3 42½	20 80
Saturday	33½	71½	9 40	3 40	.....
Monday	32⅜	69¾	9 50	3 30	20 55

Mining Share Market.

SAN FRANCISCO, Nov. 2, 1893.

The Comstock market showed further improvement toward the close of last week, but has since weakened. Last Saturday the prices of the leading north-end stocks were higher than at any time since the revival began, two weeks ago, while business among the commission brokers continued large. During the forenoon Consolidated California & Virginia reached $3.10, Best & Belcher $1.65, and Opbir $1.55. Monday there was a continued active trade in the Comstock shares. The attendance in both board-rooms was larger than at any time since the revival began, and commission brokers were kept busy executing orders to buy and sell. Tuesday there was no abatement of public interest. At the opening business continued very active, and prices were generally higher. In fact the leading stocks, Consolidated California & Virginia, Opbir, Best & Belcher, etc., reached the highest prices attained since the Potosi deal in May and June last.

Yesterday the market relaxed and was much easier.

A dispatch from Virginia, October 28th, says that active operations in the Consolidated Virginia, suspended some time ago, were resumed October 27th under Foreman Charles Harper with a force of 11 men. Three shifts of four men each will be engaged in making repairs to the shaft down to the 1000-foot level. It is expected that the shaft repairs will be completed early in November, when an additional force will be employed in explorations, and operations in the West Consolidated will be commenced, which will be worked through this shaft. Little repairing to the shaft will be necessary until the 600-foot level is reached. The resumption of work at the Consolidated is regarded as the harbinger of more prosperous times for the Comstock.

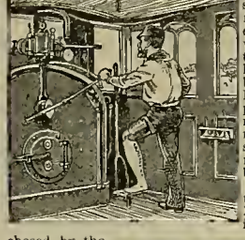
Cal. Debris Commission Notices.

NOTICE.—The California Debris Commission, having received petitions to mine by the hydraulic process from Westall and Hughes, in the New York mine in Sierra county, to deposit tailings behind a dam in Howard creek; from Corbiere and Bean, near Clipper Mills, Yuba county, to deposit tailings behind a dam in Hampshire creek; from W. A. and M. E Schofield, in the Phœnix mine, near Hepsidam, Sierra county, to deposit tailings behind dams in Whisky creek and the North Fork of Slate creek; from the Graycroft Mining Company, in the Graycroft Hill mine, near Downieville, Sierra county, to deposit tailings behind dams in Davidson ravine; from the Excelsior Mining Company, in the Excelsior hydraulic mine, near Downieville, Sierra county, to deposit tailings in and near Eagle ravine; from the Eureka Mining Company, in the Eureka mining claim, near Downieville, Sierra county, to deposit tailings behind dams in Kanaka and Sawmill ravines, and from the Quincy Mining and Water Company, in the Beau Hill, Jack's Hill, Mountain House, Gopher Hill and Shore's Hill claims, near Spanish Ranch, Plumas county, to deposit tailings in old hydraulic pits and behind dams in Maurer ravine, Spanish creek and Green flat, gives notice to all concerned that a hearing will be held a the office of the Commission, Room 92, Flood Building, San Francisco, on November 7, 1893, at 1:30 o'clock P. M. On and before this hour and date all parties interested may file affidavits, plans and maps in support of their respective claims. By order of the Commission: W. H. Heuer, Major, Corps of Engineers, U. S. A., Secretary of the Commission.

ARTIFICIAL LEGS AND ARMS

WITH RUBBER FEET AND HANDS.

It is not unusual to see an engineer with hand on the throttle, or a conductor, brakeman, fireman,



carpenter, mason, miner, in fact men of every vocation, wearing one or two artificial legs with rubber feet, Marks' Patents, and performing as much labor as men in possession of all their natural members.

Over 14,000 artificial limbs of Marks' Patents in use. Purchased by the U.S. and many foreign governments. One-half of the limbs furnished by us are made from measurements without our seeing the wearers. Fit guaranteed. A treatise of 430 pages, with 260 illustrations and a formula for measuring sent free. Address,

A. A. MARKS, 701 Broadway, New York.

LIGHTNING LARGEST **WELL MACHINERY** Works.

All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

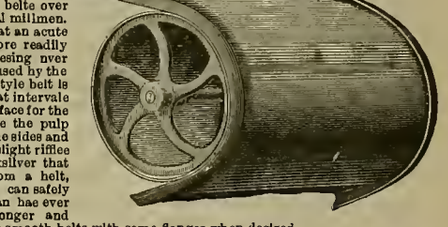
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

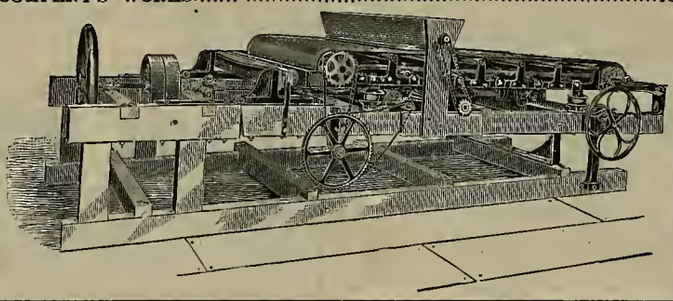
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.
The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator. You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

FULTON ENGINEERING AND SHIP-BUILDING WORKS.

Successors to FULTON IRON WORKS (Hinckley, Spiers & Hayes), and F. A. HUNTINGTON.

OFFICE AND BRANCH WORKS, 213 FIRST STREET. - - - - MAIN WORKS: HARBOR VIEW, SAN FRANCISCO, CAL.

MINING AND MILLING MACHINERY.

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

Manufacturers of the TUSTIN PULVERIZER: Adapted to Wet or Dry Crushing.

Also the well-known HUNTINGTON CENTRIFUGAL ROLLER QUARTZ MILL.

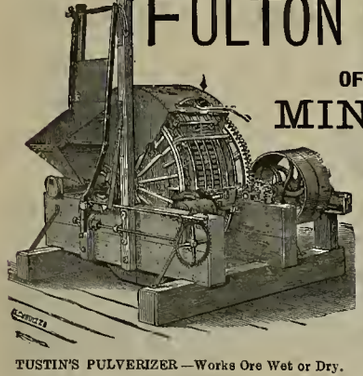
Special Descriptive Circulars of these Mills sent on application.

Specialties Manufactured by us:—"HUNTINGTON" BLAKE ROCK BREAKER; "FULTON" BLAKE ROCK BREAKER; FRUE VANNERS; "BOSS" CONTINUOUS SYSTEM.

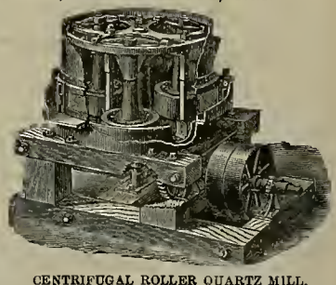
Manufacturers of all kinds of ELECTRIC LIGHT AND ELECTRIC R.R. AND CABLE R.R. PLANTS. STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound Condensing & Non-Condensing.

Agents and Manufacturers of the De LA VERGNE REFRIGERATING MACHINES, FILTERS OF THE NEW YORK FILTER COMPANY.

Sole Agents for THE DEANE STEAM PUMP, ARMINGTON & SIMS ENGINES, LEFFEL WATER WHEELS.



TUSTIN'S PULVERIZER—Works Ore Wet or Dry.



CENTRIFUGAL ROLLER QUARTZ MILL.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

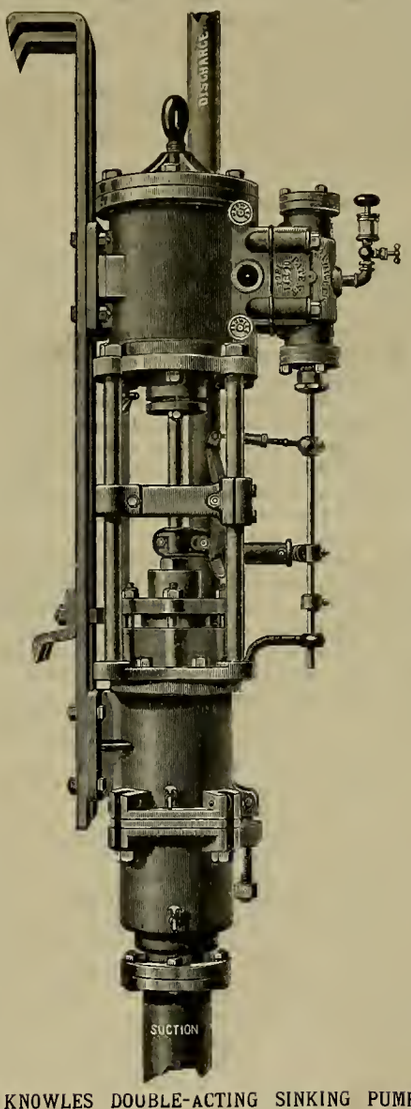
VOLUME LXVII. Number 20. SAN FRANCISCO, SATURDAY, NOVEMBER 11, 1893. Three Dollars per Annum. Single Copies, 10 Cents.

Knowles Patent Mining Pump.

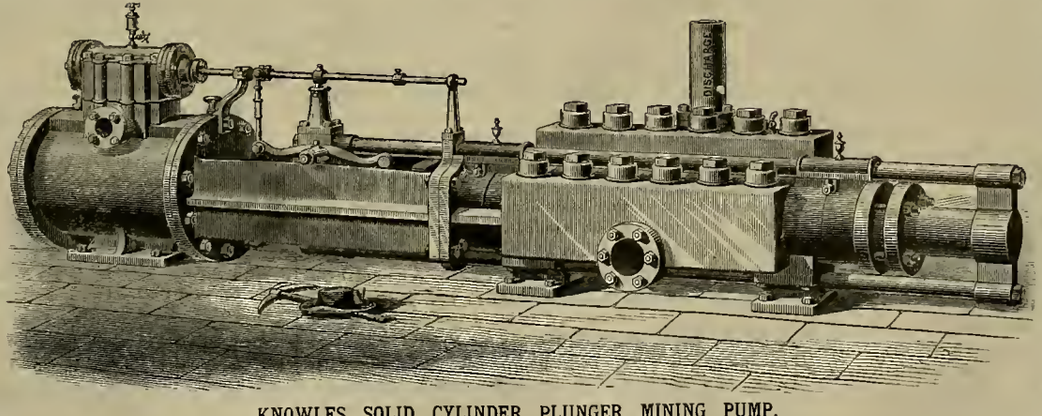
A special form of plunger mining pump is shown in the lower illustration on this page. It is the Knowles patent solid cylinder pattern, and is especially adapted for the heaviest work, and will pump in a single lift 1000 feet as well as one of 300 feet high. The heavy castings, absence of joints and pecnliar arrangement of valves and plungers, render this pump very durable. Practically, the only wearing point in the entire water end is the packing in the stuffing-boxes. It is provided with two hand-hole plates, so that the cylinder can readily he cleaned. These pumps have two single-acting plungers attached to strong cross-heads by heavy rods of wronght iron. These connecting rods are supported by and slide on adjustable guides or bearings, thus keeping the plungers in line and preventing uneven wear. The piston-rod does not enter the pump cylinder, and is therefore not exposed to the action of the mine water. The plungers have outside stuffing-boxes which can be readily packed, and, being in sight, any leakage of water through the glands can be quickly detected. The plnngers not passing through any sleeve or stuffing-hox in center of cylinder, but heing "outside connected," it is not possible for any water to leak hy or to pass from one end of the cylinder to the other; the displacement of water at each stroke is equal.

The vertical pump shown in the upper illustration is used for sinking new shafts, recovering old mines that have been "drowned out," and for mining operations reqniring the use of a light, portable and efficient steam pump, also for sinking wells and general excavation work. It ia easily handled, and can be placed in any position. Althongh designed to work vertically, it will also operate well when placed on an angle or horizontally. Being compact in design and strongly made, it will withstand rough usage. The pump requires hut little room in the shaft.

Each pump is arranged with a ring holt, firmly imbedded in the upper steam cylinder head, to which tackle for raising or lowering can he readily attached. Adjustable wrought-iron dogs, for hanging the pump to the shaft timbering, are bolted to the cylinders. The lower plnnger works in a removahle cylinder of gun-metal composition, which can be readily replaced hy a new one when worn out. The water valves are of vnlcanized rubber, and work on seats of gun-metal composition. Swing holts admit of easy access to the water-valves and pump-harrel. Parke & Lacy are agents for the Knowles pumps.



KNOWLES DOUBLE-ACTING SINKING PUMP.



KNOWLES SOLID CYLINDER PLUNGER MINING PUMP.

It develops that the United States Senate failed to confirm the Presidential appointment of the California Debris Commissioners, and, when the Senate adjourned, their term of service, while awaiting confirmation, technically expired. It will therefore be necessary for the President to reappoint the commission that it may be empowered to continue the work already done. This condition of things transpired at the meeting of the commission last Tuesday, at the hearing of applications for license by a number of mines in Plumas and Ynba counties. The hearing was held according to form, and Col. Mendell then stated that the commission must be reappointed before action could be taken. Secretary Ralaton, of the State Miners Association, afterwards telegraphed a statement of the circumstances to the Secretary of War, but at this writing (Thursday) no answer had been received. Failure to confirm the commission was unquestionably an oversight. The President will no doubt make the reappointments, as soon as his attention is called to the matter.

The activity in California mines at the present time is great, and the number of produciog mines is constantly growing. It is still a fact, however, that the list of non-producing mines is long, comprising a very considerable part of the total list in the State. These mines have been shut down from various causes. Some hydraulic mines have been worked out, more have been stopped by judicial decree. Some mines have been wrecked through incompetent management, others by differences between partners or stockholders. But very many have become idle because of the decrease in grade of the ore or increasing expense of mining or milling, or both. These latter bave been common occurrences for years. But now, with improvement in milling facilities, the greater relative value of gold, and the renewed activity of the industry, many of these non-producers ought to become producers. It costs less to mill than it used to. Better and higher results are attained. And it costs less to mine also than a few years ago. Labor is cheap. Implements, appliances, explosives, etc., are cheaper The inducements for taking up low-grade properties are greater than ever before. The opportunities should no longer be neglected.

It is a curious fact that silver is again advancing despite recent unfavorable legislation. At the time of passage of the repeal bill it dropped several cents in New York, and, to a lesser extent, in London. During the earlier days of this week, however, silver showed marked improvement in both markets. It is explained that the rise is due in part to the helief that the Government of Russia is contemplating the step of adopting silver as part of her monetary system. It is said that Russia will replace her uncovered paper money with silver, to be used for subsidiary coin. At present the amount of silver in use in Russia as money is not 53 cents per capita. Russia has $500,000,000 of uncovered paper, or about $4.42 per capita. It is stated that Russia can easily absorb $260,000,000 of silver and is desirous of doing so for the purpose of pushing her commerce in the East with Persia, India and China, which use silver almost exclnsively as money.

The outlook appears to indicate an advance in silver in the not remote future. The reasons are several: The United States will unquestionably become a large purchaser. Russia is helieved to be ready to absorb a large amount of the output. Lead and copper are certain to advance and offer encouragement for the resumption of lead and copper-silver mines. There are some high-grade silver mines which can be operated at a profit now, but they are not sufficient to supply the demands of the world. The result will certainly be an advance in price beyond the point where average ore may be profitably milled. International bimetallism is not an iridescent dream, though it looked that way not long since. Legislation has been shaping itself in that direction for some time.

AN unknown and powerful explosive appears to be concealed within coal from a newly opened mine near Comox, British Columbia. Some weeks ago an explosion occurred aboard the steamship Barracouta, loaded with Comox coal. The mishap was attributed either to gas or dynamite. When the vessel discharged cargo here, every bucketful of coal was carefully inspected, with the result of ascertaining that none of the coal had been heated, thus disposing of the gas theory, and that none of the coal was shattered. This effectually combatted the dynamite theory. However, the presence of sulphur was discovered. Last week an explosion occurred aboard the steamship San Mateo, which loaded at the same mine, under exactly the same mysterious circumstances, with an equal amount of damage as the Barracouta's mishap. The coal had been in the hold less than 48 hours. Experts have been engaged to make examinations of the coal, with a view of connecting the sulphur with the cause of the explosion. This much is known: a secret, potent force exists in this coal not known to other coals of commerce. The problem to be solved is the discovery of the explosive agent, and the chemical process by which its destructive power is exerted.

THERE is no profession or calling that requires more technical knowledge and training than that of the mine superintendent, in order to enable him to follow his vocation to the greatest advantage. He should have a knowledge of all mineral ores and be capable of ascertaining the percentage of metal those ores contain, as well as a practical knowledge of the methods of working lodes and auriferous veins. He should be informed as to the construction of mining machinery, water races, dams and reservoirs. He should have a knowledge of rocks and formations where different minerals are likely to be found. Indeed, a thorough knowledge of mining requires many years of toil and study in both the technical and practical branches. As year by year passes, we find the necessity growing for men who are engaged in conducting large mining operations having a practical and technical knowledge of the branch they are engaged in. It is only through skilled superintendence that the mining industry will be placed on a more solid and commercial foundation, and give greater encouragement for the investment of capital to open up and develop our mineral wealth.

POLITICS develops surprising things. It is now declared that Voorhees, who was the Senate leader of the repeal forces, will introduce a free-coinage measure. It is well known that Voorhees was until very recently a silver man, and he declared during the Senate debates on repeal that "he is now no less a friend of silver than before." It is not likely, however, that the silver men will rely on Voorhees to champion their cause.

FRIDAY, Nov. 10.—The President has reappointed the Debris Commission.

The New Mining Bill.

The full text of the bill drafted by the special committee of the California Miners Association, appointed for that purpose by the late convention, is presented in this issue. Its provisions are of the utmost importance to all miners, and they should be carefully noted.

It is expected that this bill will be the embodiment of the desires and opinions of all the mining States, and a plan is on foot to present it to the representative mining men of the various States, with a view of securing their endorsement. To Mr. Chas. G. Yale has been delegated the duty of communicating with leading citizens in the various mining States and Territories—Montana, Colorado, Wyoming, Idaho, Oregon, Washington, Nevada, Utah, Arizona and New Mexico—with a view to securing the organization in these several States of a body similar to the California Miners Association. These organizations are to be requested to send delegates to a general convention to be held in San Francisco, where the interests of all are to be considered. If the bill is not fully satisfactory to all, an attempt will be made to expand its provisions so that it may be rendered satisfactory. The bill would then be presented at Washington backed by the sentiment of all the mining States.

The movement is most timely and important, and it is hoped it will be successful. It is hoped to get the delegates from the various States in San Francisco at a comparatively early date.

Low Mining and Milling Costs.

Taking for his text an article which recently appeared in the MINING AND SCIENTIFIC PRESS on the "Lowest Cost of Mining and Milling," Albert Williams Jr., whose experience has been largely in California, makes some very timely and instructive comment in the *Engineering Magazine*. He warns the reader that extremes are apt to be misleading because the circumstances are always exceptional, and that they are therefore no safe guide for undertakings of similar character under usual conditions. The mines and works which give the most economical results are the ones which have the best total average of favoring conditions, which, though indefinitely numerous in minor details, are, in the case of mines, grouped under these main heads: size, character and richness of deposit; scale of operations; ease of working, with reference to hardness or toughness of rock, amount of timbering needed, explosives, tools, or power drills, etc.; nature of openings, whether open cuts, shafts, inclines or adits; altitude and general surrounding topography; climate; presence of water; temperature at great depths; facilities for using water and electric power; available local supplies of timber, fuel, etc.; communications with points of supply and distribution, as to means, time and freight rates; character of labor; wages and cost of living; ruling market prices for all items of supplies and products; and, of course, skill in technical management and in business administration. It will be easily seen that under each of these and other principal heads a long list of minor details could be enumerated, all of which have more or less weight in the final result. At a large metallurgical establishment the complexity of influencing conditions is even greater, for while some of the mining conditions are dropped, a greater number of new ones are introduced. Then, again, taking a broader view, not only do the conditions at the mines and metallurgical plants mutually affect each other, but they are also themselves affected by a series of apparently outside influences, such as legislation, competition, state of the money market, progress in the manufacture of machinery, and so on indefinitely. The point of all this is that when one comes to figuring probable costs and results in any mining or metallurgical enterprise, the task is not as simple as might appear. The estimate never includes more than a part of all the factors; but whether the estimator is conscious or unconscious of their existence, they are all the same in the actual result.

Mr. Williams adds an instance or two of low costs, citing the famous North Bloomfield, where two cents per cubic yard—about one cent per ton—covered all expenses. But to estimate on this basis for an ordinary placer mine would be absurd. There are not so very many records of success where the gravel runs lower than ten cents per yard. Some mines of large deposits, with a plentiful and cheap water supply, ample dump room, and a fairly long working season, have paid well on lower than ten-cent gravel.

On the whole, Mr. Williams has excellently stated the conditions which go to make up the cost in mining. He might have added, however, that the devices employed to secure high results in phenomenal cases very often afford a suggestion which may find practical adaptation in other cases where the conditions are not all the same. Actual profit may be derived from a study of the experience of others, no matter what the circumstances.

Fruits and the Mines.

The attention of California producers has in recent years been so largely devoted to fruit culture that it has become the foremost State in the Union in almost every manner of fruit production. Deciduous fruits of all varieties find the highest excellence here, and citrus fruits are produced in great abundance. Prunes, grapes (table, raisin and wine), peaches, nectarines, apples, cherries, pears, apricots, plums, figs, olives, berries of all kinds, and a great many others too numerous to mention are included in the list which attain the most systematic and successful cultivation in California. There are some States which produce a greater abundance of particular fruits—Florida more oranges, many States more apples and pears—but in the mass of fruits California has no peer. It is safe to assert that the value of all its fruit products is several times greater than that of any other State; and the industry has by no means reached the limit of its growth.

California is the only State which is the largest producer of more than one variety of fruit. More prunes are raised here than in any other State; more peaches, more grapes, more olives, more figs, more nectarines, more apricots. The time will probably come when it will raise more oranges. It produces more wines than all others put together. Apricots, raisin grapes, figs and olives are raised in no other State.

California ranks high as a producer of wheat and barley, and exports perhaps a greater relative surplus than any other State. California is a large producer of wool, and one of the largest of hops. And so the list might be extended indefinitely. All these things are excellent, and go to make up a great commonwealth. All contribute to the wealth, prosperity and happiness of the people. May no branch of industry ever be diminished! May all grow to the maximum predicted by their most hopeful followers!

But it is not amiss to call attention to the fact that in all this development of fruit and other interests one other branch of industry has not been surpassed in value or importance. There is an impression in some quarters that the mining industry has been relegated to the background, and that its value is exceeded by the later and newer interests. It is true that the production of gold has been restricted in recent years, largely owing to the paralysis of hydraulic mining. But California produces many other minerals—silver, lead, quicksilver, borax, chrome, antimony, manganese, lime, marble, building stone, petroleum, asphaltum, bituminous rock, clays, coal, salt, alum, asbestos, bismuth, tin, cement, plumbago, gypsum, iron, infusorial earth, kaolin, metallic paint, mica, nickel, ochre, rock soap, slate, sulphur, talc and other substances. The chief product, however, is gold, of which in 1892 there was taken from the earth $12,571,000. The product of other minerals will swell the total output to $20,000,000 at a safe estimate. Now let us see what the producers of fruit (including wines) realized in 1892. The following figures are the result of a careful computation, and are gleaned from exact sources:

PRODUCTION IN 1892.

Citrus fruits (3485 carloads @ $360)*	$1,254,600
Prunes (28,000,000 lbs @ 5c)	1,680,000
Dried fruits (65,000,000 lbs @ 6c)	3,900,000
Raisins (53,000,000 lbs @ 4c)	2,120,000
Wines (12,000,000 gallons @ 16c)	1,920,000
Green deciduous fruits (5600 carloads @ $630)†	3,528,000
Canned fruits (1,600,000 cases @ $2)	3,200,000
Miscellaneous, fruits consumed at home, etc.	1,000,000
Total	$18,602,600

*On a basis of $1.50 per box for oranges.

†This is based on the average price received by shippers of 1694 carloads through the California Fruit Union and is the maximum. No separate account of the shipment of peaches, apricots, grapes, etc., was taken, and it cannot therefore be given. The large proportion was of course peaches.

It will thus be seen that the product of gold alone in California ($12,571,000) is larger than any three of these items combined, and the relative values of the fruit and mineral interests of California are therefore as follows for 1892:

Mines	$20,000,000
Fruits	18,602,600
Balance for mines	$ 1,397,400

The fruit industry is growing rapidly. So is the mining. The year 1893 has not been a very profitable fruit year; but it has for the mines. There is room, and plenty of it, for both industries in the State; but it is well enough not to lose sight of the fact that California proposes to retain its character as the chief producer of gold in the United States, having yielded more than twice as much as any other State in 1892. It will do better in 1893.

THE preparatory work for the mineral exhibit at the Midwinter Fair goes on apace. Contributions have been reasonably good enough to guarantee that the extensive plans mapped out by the committee can be carried out successfully. Materials for the various exhibits have been freely promised and it is safe to assume that no branch of the industry will be without representation. The committee is working diligently and it deserves success.

The Miners Association Bill.

At the recent convention of the State Miners Association, a committee was appointed to prepare for presentation to Congress a bill embodying the sentiment and action of the convention on several important matters affecting the interests of the miners. Hon. Tirey L. Ford, Judge Edward A. Belcher and Mr. Charles G. Yale were selected as the most competent to perform this service. They have been engaged for some time and have just completed their work, which is contained in the accompanying report to the Executive Committee of the association. It is proper to state that the bill is still subject to change. Following is the report, containing the text of the proposed bill:

To the President, Secretary and Members of the Executive Committee of the California Miners Association, GENTLEMEN:—The undersigned committee, appointed by the above-named association at its recent annual meeting, with instructions to draft a bill to be presented to Congress, embodying the wishes of said association as expressed at said annual meeting, concerning certain portions of the Revised Statutes relative to the acquisition of title to the mineral lands of the United States and the manner of holding the same, beg leave to submit the following:

An Act to amend Chapter VI of Title 32 of the Revised Statutes relating to mineral lands and mining resources.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SECTION 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground by posts or monuments, so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein, until payment of the purchase money and a certificate of entry has been issued therefor; but where such claims are held in common such expenditure may be made upon any one claim. That the period within which the work required to be done annually on mineral claims shall commence at 12 o'clock meridian on the first day of January succeeding the date of location of such claim. When the labor required by this act shall have been performed or the improvements made, an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the Recorder of Deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: Provided, That the original locators, their heirs, assigns or legal representatives do not resume work upon the claim after such failure and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the Recorder of Deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co-owners. Where a person or company has or may run a tunnel for the purpose of developing a claim or claims owned by said person or company, the money so expended in running said tunnel shall be taken and considered as expended on said claim or claims: Provided further, That said claim or claims shall be distinctly marked on the surface as provided in this act."

SEC. 3. That section twenty-three hundred and thirty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 4. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths within the State or Territory where the claims may be situated, having an official seal, and all testimony and proofs may be taken before any such officer, and, when duly certified by the officer taking the same attested by his seal of office, shall have the same force and effect as if taken before the register and receiver of the Land Office. In cases of contest as to the mineral or agricultural character of land, the testimony and proofs may be taken as herein provided on personal notice of at least ten days to the opposing party, or, if such party cannot be found, then by publication of at least once a week for thirty days in a newspaper to be designated by the Register of the Land Office as published nearest to the location of such land, and the Register shall require proof that such notice has been given: Provided, That the presence of rock in place bearing gold, silver, cinnabar, petroleum or other valuable mineral shall be regarded as presumptive evidence that the land containing the same is, and always has been, mineral in character: And provided further, That in investigating the character of land with a view to ascertain whether it is more valuable for mineral than agriculture, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be presumptive evidence that the land in question is, and always has been, mineral in character: And provided further, That wherever land is proven to be within a well defined mineral belt, such land shall be deemed, presumed and taken to be, and always to have been, mineral land, unless the contrary is proven: And provided further, That the provisions of this chapter shall be liberally construed with a view to aid the applicant in procuring title to the mineral lands of the United States, and the rules and regulations prescribed by the Land Department for its government and that of its officers, in disposing of said lands, shall be so formulated and administered as to assist the Government in disposing of said lands to *bona fide* applicants, and not so as to impede the sale thereof or impose onerous burdens upon applicants."

SEC. 5. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to be used or occupied, by the proprietor of such vein or lode claim for mining or milling purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superficies of the lode claim. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his millsite as provided in this section."

Said committee desires to further state that, while the foregoing is believed to embody all the changes recommended by said association and most urgently desired by mineral claimants, the time is rapidly approaching when an entire revision of our Federal mining code will be desirable, and we would suggest that, when convenient, your honorable body take some appropriate steps in that direction. Respectfully submitted,

TIREY L. FORD, Chairman,
E. A. BELCHER,
CHAS. G. YALE, Committee.

Suspension of Assessment Work for 1893.

Through the courtesy of Senator Perkins the text of the bill suspending for the year 1893 the operation of the statute requiring $100 annual assessment work on unpatented mining claims has been received by the MINING AND SCIENTIFIC PRESS. The bill is brief and its provisions are plain. One feature of it should not be overlooked by miners. In order to secure the benefits of the act, it is necessary to place on record before December 31, 1893, a notice that the owner intends in good faith to hold and work his claim. The text of the law is as follows:

An Act to amend section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, relating to mining claims.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the provisions of section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, which require that on each claim located after the tenth day of May, eighteen hundred and seventy-two, and until patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year, be suspended for the year eighteen hundred and ninety-three so that no claim which has been regularly located and recorded as required by by the local laws and mining regulations shall be subject to forfeiture for non-performance of the annual assessment for the year eighteen hundred and ninety-three: *Provided*, That the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed on or before December thirty-first, eighteen hundred and ninety-three, a notice that he or they, in good faith intend to hold and work said claim: *Provided, however*, that the provisions of this act shall not apply to the State of South Dakota. This act shall take effect from and after its passage.

THE people of Spokane, Wash., are taking energetic measures toward making a creditable exhibit at the Midwinter Fair. The intention is not only to show minerals, but other resources and manufactures. The product of the mines, however, will be the principal feature. The Cœur d'Alene and other mine-owners and the railroads have given assurance of their substantial aid.

A Case of Valley Misrepresentation.

The Sutter *Independent*, whose gospel is the utterances of the Anti-Debris Association, says there is no valley prejudice against hydraulic mines, or miners as such, and complains that the anti-debris people have been misrepresented by this paper and by others. It is no doubt true that there is not so much prejudice as there was. That is the reason why the Anti-Debris Association is losing its grip. But that there was and is prejudice will scarcely be disputed by fair-minded persons. A signal instance, both of prejudice and misrepresentation, relative to the question as to whether restraining dams will restrain, is recalled. It is pertinent in this connection, because the *Independent* makes this subject the partial basis of its tirade against this paper, and says they will not restrain. An important valley convention met on June 10th of last year, at Sacramento, and passed resolutions defining their position on the restraining-works question, and to sustain their position quoted from the official report of the Government engineers, deliberately omitting the part italicized:

"These dams, however, will not be effective in impounding all the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams to eventually find lodgment in the river below. The finer sand and clay cannot be effectually impounded by such barriers, but will be carried off in suspension. *With the improved condition which it is desired to give to the navigable rivers, it is probable that the greater part of this fine material can be carried off without being productive of harm.*"

The concluding sentence is the essence of the paragraph. It cannot be pleaded that it was omitted for any other purpose but to give only a partial view of the situation. It was unfair, discreditable and dishonest. The miners have never been driven to the necessity of mangling and misquoting official utterances in order to bolster up their position.

The Noble Decison.

TO THE EDITOR:—Referring to B. M. Newcomb's letter in the PRESS of October 14th, on the Noble ruling, I wish to say that the Bigelow lodes were located from a shaft by *two locators*. If each of these persons, drifting off on his claim 100 feet on a ledge all the way, had put his initial monument over the river end of his drift, and claimed that distance back to the shaft, would Mr. Noble, in that case, have cancelled the patents on the ground of their being but one discovery?

Were not five feet of the lode, exposed in the shaft and divided, just as good under the mining law for the making of two locations, as 100 feet of the same vein would have been? What right has the Secretary of the Interior to decide how little or how much of an exposed lode is to be considered a discovery?

I tried to show in my letter of September 23d that the mere finding of a hunch of ore does not constitute a discovery until it has been proved that a vein exists there, and that it is on unclaimed land. The real discovery is the lode traced out for the length of a claim and appropriated. When a sailor sees a mast above the level of the sea he has discovered a submerged ship, and not solely a piece of Oregon pine. What promises to be a mine is a discovery.

Before Mr. Bigelow's patents were cancelled it was the duty of Mr. Noble to show conclusively that there was no evidence whatever of there being a lode anywhere within the 3000 feet of ground claimed.

But the Secretary admitted that there was enough mineral in the shaft to constitute a discovery for one claim. Why, then, did he cancel both patents? One of them, according to his own dictum, was a valid location, and yet he declared it invalid. Could that be the act of a wise or a just man?

I do not know whether Mr. Bigelow's claims crop out at several places or nowhere but at the original shaft, nor, in one sense do I care, for I am not purposely fighting his battle, though to identify the case I have been compelled to use his name. I am fighting the conceited ignorance of the Interior Department as represented by a Secretary who assumed that he knew a great deal more about the locating of mineral lodes than was known by experienced miners.

As I have hinted that Mr. Bigelow has no guiding lines over me, so to those who may suppose that I am attacking Mr. Noble on political grounds, I will say that they are mistaken, for I am a Republican. I am glad Mr. Newcomb tempted me to write this second epistle on Mr. Noble's ignoble decision. JOHN DARE EMERSLEY.

Dos Cabezas, Ariz., Nov. 3, 1893.

Blank Applications to Mine.

Appended is the blank form of application to mine by the hydraulic process adopted hy the California Debris Commission. Copies will he furnished, on application, to persons desiring to mine:

To the California Debris Commission, Room 92 Flood Building, San Francisco, Cal.

The undersigned, being the proprietor.. of the mine mentioned, hereby petition.. for authority to work by the "hydraulic process" the mine described below.

Name of mine.....

Where situated.....

Names of claims composing the property.....

Area proposed to work by the hydraulic process.....

Height of bank to be worked.....

Character of material, loose or cemented.....

Estimated to consist of.....per cent bowlders,.....per cent cobblestones,.....per cent gravel,.....per cent sand,.....per cent loam or pipe clay.

Mine drains into.....creek, which reaches .....river.

Source of water supply.....

Length of ditch....., width....., depth.....

Grade of ditch.....

If there is a water reservoir, describe it.....

.....inches of water used, for.....hours per day, for ..... months in the year.

Pressure of water used.....

Sluice is.....feet wide,.....feet deep, with grade of..... in twelve feet.

Cubic yards of gravel to be worked in an hour.....

Character and location of barriers, existing or proposed, to restrain debris (describe in detail).....

Area of reservoir for holding debris.....

Capacity of proposed reservoir in cubic yards.....

Is it a watercourse or worked-out pit?.....

What is the drainage area above the site, in case the reservoir is a watercourse?.....

Grade of bottom of reservoir, ...feet per hundred feet.

Area of ground draining into impounding reservoir in case it is not in a watercourse.....

Average annual rainfall, if known.....

Rainfall during heaviest storms.....

Deepest snow known (on level).....

Width and average depth of stream at reservoir site during highest known flood.....

NOTE.—Where above information cannot he accurately stated, give estimated amount and indicate that it is estimated.

Enclosed herewith are the following maps, plans, sketches, etc.:

1. Map showing claims, proposed workings, and part already worked.
2. Map showing impounding reservoir.
3. Section of proposed dam or barrier. Longitudinal section of reservoir. Cross sections of reservoir.

NOTE.—The above maps are necessary for important mines and desirable in all cases. The cross sections should be 200 to 500 feet apart, and taken at the widest and narrowest places. For small mines sketch maps may suffice, but for important mines these maps should be made hy an experienced engineer and should show the contours of the impounding reservoir so that its contents can he accurately computed. Each map should hear the name of the mine and show who made it.

Names of mines whose owners are entitled to use proposed reservoir and whose petitions are submitted with this one, constituting a joint petition.....

Names of mines which drain into the same reservoir and which are not entitled to use it.....

Route to mine.....

Name of person to whom communications concerning mine should be sent.....

Postoffice address.....

Remarks.....

In accordance with Section 10 of the Act creating the California Debris Commission the right and privilege is hereby surrendered to the United States to regulate by law, as provided in the Act, or hy any law that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the working of said mine shall be restrained, and what amount of debris shall be produced therefrom; it being understood that the surrender aforesaid shall not be construed as in any way affecting the right of the owners to operate said mine by any other process or method now in use in the State of California.

..... [SEAL.] .....[SEAL.]

STATE OF CALIFORNIA,
County of ..... } ss.

Personally appeared before me, ... the petitioner.., named in the foregoing petition, who, being duly sworn according to law, depose.. and say.. that ..... the person.. named in the foregoing petition, that ..be.. know.. the contents thereof, and that the statements made therein are true to the best of ..b.... knowledge and belief, and that ..he.....the person.. who executed the above surrender.

Sworn and subscribed to this..... day of....., 189.. }

Before me, ...

Notary Public.

NOTE.—In case of an incorporated company the petition may he submitted hy its attorney in fact, or other duly authorized agent, legal evidence of which authority must he filed with the petition.

Points for Assayers.

Written for the MINING AND SCIENTIFIC PRESS by C. H. Aaron.

It often happens that an assayer in these Pacific States and Territories is asked to report an assay of gold or silver ore in terms of Spanish weights, for the accommodation of a Spanish-American patron. Gold and silver are required in *onzas por tonelada*, silver in *marcos por tonelada*, or *marcos por carga*.

The *onza* is different from our troy ounce, and the *tonelada* is not quite the same as our ton, although it contains 2000 Spanish pounds, or *libras*, each containing 16 *onzas*, or 2 *marcos*.

The American assay report, in troy ounces per ton, is converted, almost accurately, into *onzas* per *tonelada* hy the addition of 10 per cent to the number of ounces. This is easily shown, as follows:

A ton contains 29,166.66+ troy ounces, hence an ore containing 1 per cent of silver contains 291.66+ ounces. A *tonelada* contains 32,000 *onzas*, hence 1 per cent is 320 *onzas*. Now, 291.67+1 per cent=320.83, that is to say, the error is only .83 *onza* in 320 *onzas*, which is less than the probable variation of assays in silver ore of that grade of richness. It is not often that we have so many ounces of gold in a ton of ore, and in ordinary gold ore the error would not he serious. For instance, in ore containing 2 917 onnces of gold to the ton, we get by this rule, at the most, 3.209, or .09 *onza* too high.

If we take four grammes of ore for the assay, each milligramme of metal obtained is equivalent to 1 *marco* in the *tonelada*, as will be seen from the fact that 4 grammes contain 4000 milligrammes, and one *tonelada* contains 4000 *onzas*, so that the stated weight of ore is an assay *tonelada* in which the *points* of bead weight equal the *marcos* required, which are converted into *onzas* when multiplied by 8. From this it follows that if we take 32 grammes of ore, we have an assay *tonelada* in which each milligramme represents 1 *onza*.

In Mexico, the *carga* (mule-load) contains 300 *libras*, or three-twentieths of a *tonelada*, hence if we multiply the *marcos* or *onzas* of gold or silver found in the *tonelada* hy 3, and divide by 20, we have the *marcos* or *onzas* in a Mexican *carga*. In Honduras a *carga* consists of only 200 *libras*, or one-tenth *tonelada*, so that we need only divide the value of a *tonelada* hy 10 to obtain that of a *carga*.

The *libra* and our pound are not quite equal, hut for moderate weights and general purposes they have been accepted as such in my experience of Central America.

C. H. AARON.

Correction.

TO THE EDITOR:—An error, probably clerical, found its way into my "Point for Millmen" in your issue of November 4th. In the arithmetical rule it is directed to "divide the lesser remainder by the greater." The reverse was intended, as shown in the example, viz., *divide the greater remainder by the lesser, etc.* I will take this occasion to remark that, in formulating the rule, I am supposing the headings to he richer and less in quantity than the tailings, as must he the case where effective concentration has been done. The rule is:

RULE.—*From the assay value per ton of ore and of headings, respectively, subtract the assay value per ton of tailings; divide the greater remainder by the lesser; the quotient is the answer sought.* C. H. AARON.

THE organization of the California State Mining Exhibit Committee is as follows:

President—J. J. Crawford.

Secretary—W. C. Ralston.

Executive Committee—S. K. Thornton, S. B. Christy, Frank McLaughlin.

Advisory Committee—R. McMurray, W. S. Chapman, Thos. Boysen, Chas. G. Yale, W. W. Stow, H. Pichoir, John Daggett, J A. Clark, John Baliard, Tirey L. Ford, Niles Searls, A. J. Ralston, Wm. Clift.

Finance Committee—Edward Coleman, Geo. T. Marye, Felix Chappellet, Adolph Hirschman, Martin Jones, M. W. Belshaw, Chas. W. Randall, Samuel J. Hendy, Dan T. Cole, J. E. Doolittle, Geo. R. Wells, W. E. Deane.

Mr. F. A. Winchell.

Mr. F. A. Winchell, for a number of years prominently connected with the Crane Company of Chicago as auditor, has associated himself with the New York Belting & Packing Company, Ltd., 13 Park Row, New York City, as manager of sales department. Mr. Winchell is a gentleman of genial disposition and is possessed of rare executive and business ability. He is popularly known in the machinery trade, where he has acquired a host of friends, and the acquisition to the New York Belting & Packing Company, Ltd., in his connection with that well-known house, is one upon which it is to he congratulated.

Slickens.

THE Gold Eagle mine at Alherni, B. C., has been bonded for $50,000, and a contract entered into for 600 feet of tunneling.

SENATOR JONES, of Nevada, and ex-Senator Mahone, of Virginia, are said to have bought the Montgomery gold mine near Concord, N. C.

THE hoisting works of the Harmony mine, Nevada City, were burned Wednesday morning at 5 o'clock. The machinery was not damaged, and will he running again in a day or two.

REPRESENTATIVE GEARY has succeeded in getting the War Department to order a survey of the Sacramento river from Red Bluff to Redding, for the purpose of making estimates for contemplated improvements.

IT is said that another gold field has been discovered in Elko county, Nev., which rivals the Bruneau placers in richness. It is located on Van Duzer creek, near Mountain City, and it is said that from 25 to 50 cents per pan are secured.

THE Young American Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $1,000,000, with G. A. Falkenstein, S. Kline, James Hoffman, John Blnett and W. H. Russell of San Francisco as directors.

A RICH LEDGE has been struck in the North Pole gold mine, Baker City, Or., in a tunnel 968 feet, at a vein depth of 400 feet. A 20-stamp mill is being put in. The ore will be worked hy the McArthur-Forrest or cyanide process, and tests made on ores from that section most satisfactory results were obtained.

THE Normandie Gold Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $10,000,000, of which $500 has been subscribed, with Thomas Cole and John A. Hammersmith of San Francisco, W. C. Ralston and Charles G. Yale of Oakland and Wm. Bowers of Alameda as directors.

IT is reported that the Cassair placer mines, Alaska, are about worked out. There are mountains of quartz near the Highland river, which, if they turn out as expected, will afford plenty of mining. A number of Cassair miners will next year prospect in the country west of Cassair, near the Yukon river, about 500 miles distant from the Yukon mines.

THE Hancock Gold Mining Company recently organized at Sutter creek, Amador county, has purchased and will develop the Hancock gold mine in Calaveras county, for 17 years owned hy C. O. Mitchell. Enough work has been done to show that the property is a good one. Superintendent Parks, of the Kennedy mine, recommends it as an "exceptionally good place for a good paying mine.

SUPT. DAGGETT has made several more appointments to the working staff of the Mint. The list of fortunate ones is as follows: J. M. Sullivan, foreman whitener; Michael Mead, second assistant coiner; Charles Wanghman, Sonoma, workman in coiner's department; Miss S. Leary, San Francisco, adjuster; Mrs. E. Murdock, San Francisco, adjuster; Mrs. R. Dennison, San Francisco, janitress.

A PARAGRAPH has been going the rounds of the newspapers crediting Mr. Edison with the statement that he could make diamonds, rubies and other precious stones very cheaply. The statement has attracted much attention, and a San Franciscan wrote the great inventor a letter asking about it. He has received a reply from Mr. Edison, in which he says that, though a very good quality of precious stone is now being produced artificially, the market price of the genuine article has not been affected.

THE Sunset Gold Mining and Milling Company have bought the old Vanderbilt mine in Mariposa county, paying therefor $100,000. The mine, although a part of the Starr estate, was worked for years hy the Vanderbilt Company. Owing, however, to disagreements among the members, ending in numerous lawsuits, the mine reverted to the original estate and has not been worked for three years. The Sunset Company was incorporated on the 31st of October and has a capital stock of $400,000, of which $360,000 has already been subscribed. The incorporators are ex-Mayor McWeber of Oakland, A. H. Elliott, Pratt & Dunn and George Behee.

FOR several days following November 1st, there was no work in the New Vancouver colliery, at Nanaimo, B. C., the agreement between the management and the miners in regard to a 20 per cent reduction in wages having terminated the first of the month. Last Monday a new proposition was laid before the men hy the management to the effect that for the next six months the reduction in wages should be 10 in place of 20 per cent on condition of the men abiding strictly hy the terms of the former agreement of the company with the union. The miners held a stormy meeting, about 1000 being present, and the discussion lasted all day. Finally a vote was taken with the result that the men decided by a majority of 183 votes to return to work on the new terms. The East Wellington colliery is closed, the management having refused to meet the miners' demands.

THE editor of the Petalnma *Imprint*, Mr. W. A. Selkirk, who knows a good deal about mining in California, has faith in "greenhorn" prospectors. Mr. Selkirk declares that "it is an indisputable fact that from the earliest days down to the present time in the mining regions of California a large majority—probably nine-tenths—of the new discoveries have been made hy "greenhorns." Mr. Selkirk says the chief trouble with old and experienced miners is that they think they know where gold is not to he found, and they will not hunt in such places. But along comes the greenhorn, who hunts for it everywhere, and succeeds in finding it where its presence was deemed most impossible or improbable." There is some truth in what Mr. Selkirk says; but it may safely he assumed that if he were asked to "grub-stake" a prospector he would take chances on an experienced rather than a green man every time.

Foundry Note.

The Vulcan Iron Works have shipped this week a five-stamp mill—made sectional for mule transportation—to Siskiyou county, California. Also one of their Bull donkey engines to Dolbeer & Carson, Eureka. This donkey engine is used in connection with the new method of logging hy wire rope, hy which the hull teams are done away with altogether, and the logging done at considerably reduced cost.

Desquamation and Decay of Rocks and the Formation of Bowlders.

IN THREE PARTS—PART I.

Written for the MINING AND SCIENTIFIC PRESS by Henry G. Hanks, F. G. S. A., F. G. S., ex-State Mineralogist.

A person of average intelligence meeting for the first time with a large quantity of rounded stones (bowlders), every one of pure quartz, neither mixed with nor accompanied by any other mineral, would at first express surprise, then would naturally begin to theorize. Taking a common sense view, he would be likely to assert that they could not possibly have been created as found, but must have been brought from a distance and collected together by some unknown power.

To show this is the natural sequence in the human mind, I have only to quote from authors who have written on this subject, selecting a few from many. Scientific literature of a century ago, more or less, was replete with references to this subject. Among numerous authors I may mention the following as being perhaps the most prominent: Bakewell, Breislak, Buckland, Burnett, D'Argenville, De Luc, Dolomieu, Douglass, Faujas de St. Fond, Ferber, Hamilton, Hutton, Jameson, Kirwan, Knight, McCulloch, Murray, Pallas, Parkinson, Pinkerton, Playfair, Sanssure, Spallanzanni, Ure, Werner, Woodward, Whitehurst, Whiston and others. Ancient authors have also recorded this idea.

Having given much attention to the works of these and other writers of that period, I have learned to admire and respect them, and have been surprised to learn that many of our generally supposed modern ideas and theories were published and argued before the present generation was born, and that the works of some of our most noted authors might have been borrowed, if they were not, from the writings of geologists of past ages.

Investigations of the same subject in any age may lead to the same conclusions. It must be admitted that many modern inventions were known to the ancients, although new to the present generation, or at least to those not familiar with ancient writings.

Dr. Woodward (Fossils of All Kinds, etc., London, 1728) calls bowlders "globuli lapidei," and says: "They are found on the shores of the sea and rivers; they are lumps or fragments of stone or marble broken from the adjacent cliffs and rounded by being bowled and tumbled to and again by the action of the waters, whence they obtained the name of 'bowlder stones,' they being formed by an action like that of a bowl, and thereby reduced to the shape of one."

Theophrastus refers to a belief prevalent in his time that stones reproduced themselves. "The greatest and most wonderful of all the qualities of stones is that (if the accounts of it are true) of them which bring forth young" (History of Stones, XI). Mucianus, Democritus, Savonarola and Cardan have expressed a similar opinion.

There is in France a remarkable deposit of bowlders or large pebbles frequently referred to by writers both ancient and modern. It is in the department of Bouches du Rhone (formerly Provence). The modern name is "La Crau," the ancient one, "Campus Lapideus;" it is nearly level and is strewed with stones. Pliny (Book 3 Chap. 5) refers to it as the "stony plains" "remarkable for the battle of Hercules," and Strabo, thus: "Between Marseilles and the mouth of the Rhone, there is a circular plain about 100 stadia from the sea, and about 100 stadia" (about 11.4 miles) "in diameter. It has received the name of 'the stony plain' from the circumstance of its being covered with stones the size of the fist. * * * Aristotle tells us that stones being cast up by the earthquake designated *brostai*, and falling on the surface of the earth, rolled into the hollow places of the district; but Posidonius, that the place was formerly a lake, which, being congealed during violent agitation, became divided into innumerable stones like river pebbles or stones by the seashore, which they resemble both as to smoothness and appearance. * * * Æschylus, having learnt of the difficulty of accounting for it (having been informed by another), explained it away by a myth. He makes Prometheus utter the following, whilst directing Hercules the road from the Causassus to the Hesperides: 'There you will come to the undaunted army of the Ligurians, when, resistless as you may be, sure am I that you will not worst them in battle, for it is fated that there your darts will fail you, nor will you be able to take up a stone from the ground, since the country consists of a soft mold; but Jupiter, beholding your distress, will compassionate you, and, overshadowing the earth with a cloud, he will cause it to hail round stones, which you, hurling against the Ligurian army, will soon put them to flight.'"

The latter part of the above quotation is from "Prometheus Loosed," one of the lost tragedies. Mela relates that Hercules engaged in a fierce combat with Albion and Geryon, sons of Neptune, near the mouth of the Rhone, called upon Jove, his father, for assistance, who caused a shower of stones to fall which destroyed his antagonists.

The Rev. William Buckland in 1824 published an elaborate work (*Reliquæ Diluvianæ*) to prove geologically the flood of Noah—a remarkable work, considering the time when it was written—in which he displays profound knowledge of geological facts. I am indebted to his work for much information as to the knowledge possessed by geologists of his time. He believed that the deluge was the last great convulsion that had effected the surface of the earth, and it was his opinion that the bowlders and gravel were the result of that grand catastrophe. The following is a quotation: "As I have frequent occasion to make use of the word 'diluvium,' it might be necessary to premise that I apply it to those general deposits of superficial loam and gravel which appear to have been produced by the last great convulsion that has affected our planet, and entirely concede with Cuvier in considering them as being undeniable evidence of a recent and transient inundation." (*Folio* 2.) While I differ with him in opinion, I find the results of his observations and this record of them of great interest, and they have, in nearly all cases, been verified by my own. I take his facts and draw from them different conclusions, as some of my readers will very likely do from mine.

In summing up facts to prove a universal deluge, he refers to "the nature of the gravels, being in part composed of the wreck of the neighboring hills and partly of blocks that have been fragments and blocks transported from very distant regions;" and he states "the total impossibility of referring any one of these appearances to the effect of ancient or modern rivers or any other causes that are now, or appear ever to have been, in action since the retreat of diluvian waters." (*Folio* 227.)

This author noticed (*folio* 186) in bowlder deposits, occupying a large portion of the surface of Great Britain, three varieties of drift—gravel, sand and clay—the whole without horizontal division into beds and strata, with large and small bowlder stones mixed irregularly through every part of it. In some places it attained the thickness of 160 feet. Besides bowlder stones, it contained gravel, *i. e.* rounded fragments of almost any kind of rock and angular fragments of the adjacent rocks which are often of a softer nature than those which have been rolled to pebbles. A better description of the auriferous gravels of California could hardly be written.

John Miers (*Travels in Chili and La Plata, London*, 1826, *Vol.* 1, *fol.* 287), on his journey from Mendoza to Santiago, found the plains of Uspallata strewn with large rounded stones, the interstices between which were filled with alluvial sand. Those in the lower part were of uneven size and the upper were smaller. In the valley of Las Cuevas the same formation was met with. "A question naturally arises, Whence came so immense a congregation of stones, so large, and all rounded and water-worn? Certainly they could not have been deposited by the action of the present stream. It is an improbable conjecture that a large lake once filled the plain of Uspallata; that rivers of infinitely greater flow once poured into it from the valley of Las Cuevas, to whose ravishing torrents we owe the rupture and attrition as well as the congregation of this vast accumulation of rounded stones."

John Hill, in a note to his translation of Theophrastus' History of Stones, 1746, expresses the opinion that all pebbles and bowlders were formed in the waters of the deluge, and that they all had a nucleus or nodular center about which they were formed by concretion, like a pearl in the shell of an oyster.

Saussure (*Voyages dans les Alpes*, 1803, 717) thus refers to the existence of bowlders (*cailloux roules*): "In the upper parts of valleys, surrounded by high mountains, no bowlders are found which are foreign to the valley itself in which they are met with. On the plains, on the contrary, and at the opening of valleys which adjoin the plains, and even some way up the sides of the mountains which border on these plains, pebbles and blocks are found which might be said to have fallen from the skies, so different is their nature from anything found in the neighborhood."

Ignatius Donnelly (*Ragnarock, The Age of Fire and Gravel*, 1883) attempts to prove that the bowlders were showered down from the tail of a comet. "It is to the comet we must look for the source of a great part of those vast deposits which go to constitute the drift." (*Fol.* 78.)

The more I have considered this subject the less I am inclined to believe that the so-called drift is the result of sudden and violent energy. The change of rock fragments to sand and silt can be traced in continuation.

The idea of a single and universal deluge seems to have originated with a people (the Assyrians) who knew nothing of geology, in an age when the known world was a small circle including the Mediterranean, and the ideas then formed became engrafted on religion; geologists assumed the deluge and molded their theories to suit it.

While the world generally for many years, perhaps centuries, regarded bowlders and gravel as the work of some geological or astronomical cataclysm or catastrophy, a few especially keen observers began to notice that bowlder-making was rather the result of a law, the tardy effect of which was to form bowlders, gravel, sand and soil from rock masses without the necessary intervention of cataclysmal forces. A continued study of this subject, one geologist taking it up where another left off, resulted in establishing the fact that a long-hidden law existed upon the operation of which all animal and plant life depends.

Some years ago I discovered this law myself. I had not at that time any knowledge that others had written on the subject. I worked out the theory and published the result of my observations and conclusions in this journal in 1890, in some papers entitled "The Deep Gold Placers of California."

The more this subject is studied the more important it must be admitted to be. Not only does the operation of this law set our gold free in California, and form our placers, but it produces fertile soil upon which teeming millions of human beings, as well as other animals, actually subsist. Having produced the soil which animals and vegetables exhaust, it continues to renew the fertility. Without the existence of this law all organic life on this earth would soon cease. This being admitted, there will be more incentive to study this beautiful system so essential to our comfort, happiness and even existence.

What a Good Prospector Needs.

TO THE EDITOR:—It is a well-known fact to all practical prospectors and miners that the conditions under which gold exists in the different districts on the coast differ so widely that it is absolutely necessary for a person to have some experience in several different districts in order to become proficient in the calling. The change in the formation and in other features is so great sometimes within the distance of a few miles that a miner or prospector who may be competent and successful in one district would find that his knowledge obtained in that locality would avail him but little in the other. Even in different districts situated any great distance apart, where the same formation and geological conditions exist in both, the conditions under which the gold and other minerals are found in paying quantities are so different that it awakens the miner and prospector to the fact that he must make a special study of each and every locality where he prospects, for a rule that may hold good in two or three different districts will fail in another. For instance, on the slate belt, iron in a certain form will be found accompanying the pay chute, or in contact with it in some localities, while in another district, in the same class of slate, the iron will exist in another form in contact or in connection with the pay chute, or be absent altogether, *i. e.*, in large quantities. What is a sure indication of a pay chute or pocket in one locality may indicate barren rock in another, and the miner or prospector who has become thoroughly versed in one section must not allow himself to be carried away with the idea that he is master of the study, for, if he does, he will find to his disappointment that he knows but comparatively little when he comes to travel around and gain knowledge by experience in other districts. Life is too short for any man to become perfect even in any one branch of mining. In the same class of slate in which some of the best paying mines in Placer and El Dorado counties exist and are prolific in gold (especially the "hard iron" variety of slate), in the northern portion of the State through Siskiyon, Trinity and Del Norte counties it is almost barren of gold-bearing veins. And thus all formations will be found to differ in their production in different localities.

The gold-bearing veins in the State, through Placer county as a general rule, are small but rich, similar to those in the Grass Valley districts, but differ somewhat in the condition in which they hold the gold. The gold exists in most of the veins here in the form of pockets, while in the Grass Valley districts the ledges carry the pay more regularly in the form of long chutes. The Ophir district, which is principally in granite, although of a pocketty nature to a certain extent, seems to carry more permanent pay chutes than the slate lying east of it near the contact of the two bodies. East of the contact in the slate there are some large veins that at no distant day will be worked to a profit. Unlike most of the ledges here, they are not of a pocketty nature, but what are termed low-grade milling propositions. In most of them the ore is of the refractory class, but in this age of progress, when science is advancing with such rapid strides, the difficulty and great expense of reducing this class of ore will soon be overcome, so that the valuable minerals contained in those large bodies will be extracted at a profit. The crippled condition of the mining industry in this county, like many more, caused from the lack of capital and enterprising men with means to develop the mines, has caused a stagnation in all branches of business that the revival of the mining industry alone can remove. The agricultural production of Placer

county can never produce the prosperity for its people that the mining industry has in the past and will in the future when it is pursued to the extent it is in some other places. This it takes no philosopher to foresee. The gold is in the ground in almost inexhaustible quantity, and what it requires is perseveriog and enterprising men backed by capital to take it out at a profit and bring about this era of prosperity that will benefit one and all alike.

Placer county, Nov. 3, 1893. "ALEX QUARTZ."

The Repeal—What Next?

TO THE EDITOR:—It is now settled; the Government purchases no more silver. The effect on the market is a problem. It is predicted by some that silver will gradually settle down to a nominal price, yet with repeal now certain there has been no slump, as when India stopped free coinage. Others believe silver has touched bottom. It is evident that the production will fall off largely, and this may arrest further material decline. Should there be a serious decline, repeal will prove a boomerang to the Government. It will demonstrate that the Government was in the position of the man who had the bull by the horns.

The gold advocates in all the discussion have acted on a theory, without considering the ways and means of carrying it out. They are not miners, and do not know the mining situation. Our production is only $33,000,000 gold, including the gold by-product of silver mines, some $12,000,000, which will be mostly lost, and cannot be made up speedily by stimulated gold mining. No boom is yet apparent. These very gold advocates would not risk a dollar in the production of gold. They expect the venturesome prospector, without even grub money, to discover sources. The financial stringency, also, forbids any wild, or even conservative, investment in gold mining. New Yorkers look askance at a gold mining proposition. Of the production some $20,000,000 is absorbed in the arts. Hence any increase in the coinage will come from bond sales, or sharp trading with foreign countries. Balances of trade must be turned in our favor. The fear is that the reverse will happen, as is too likely.

The redemption fund is down to $80,000,000, and declining. The banks are drawing it down to strengthen their position, though it weakens the Government, which must stand behind them.

The gold advocates and the Government have trampled on silver, and, with each decline, blazoned its depreciation on the bulletin board, chaffered with the bullion-sellers, and helped on the disaster, nathless the fact that we have over $500,000,000 of silver coinage to take care of, and that every kick would prove a boomerang. The Government has "gone long," as the brokers say, on this vast sum—the whole world $3,500,000,000—and now bears the market and breaks it down by its suicidal policy. It is pledged to redeem the silver paper, and silver in gold when called upon. Its course naturally scares people to convert their silver, and it should not surprise anybody to see a steady drain of the treasury of its gold. It is not impossible that specie payments may have to be suspended, and gold sent to a premium equal to the difference in silver. It would be the logical consequence of the war on one-half our metallic money. The people may take the gold-bugs at their word, and the Government may find that to let go the hold it had on the bull is to get gored. *Nous verrons!*

When the Governments of the world—our own the first—made war upon silver, the effect on the existing coinage was forgotten. They seemingly overlooked the fact also that the value of both silver and gold was made by its demand as a money metal, and that only by maintaining this use as money could the value of the stock on hand be sustained. The commercial use was, and is, too small to absorb half the production of either metal. Safety could be found only in continuing a time-honored treatment of the metal. The increased commerce of the world would, and does, require all that can be produced of either metal, and no redundancy need be feared if paper issues were made, dollar against dollar.

We have about $700,000,000 of "uncovered paper" that could gradually be retired to make room for silver as well as gold. The prejudice of the East can be accommodated by representative paper, as well as uncovered paper. But the Government is not bound to heed this miserable prejudice in favor of "rag money." It is high time that the Eastern people were told that they must use what the treasury has to give, and partial payments in silver should be made by the Government, and paper issues be limited to $10. In England no paper is issued under $25. This would force a demand for silver, and the people would soon like it. The Californian has little respect for this Eastern prejudice, which is just as great against gold.

The effect of the warfare against silver on a great industry with all its invested capital in cities, railroads, mines, farms, etc., has been ignored as if of no concern to the Government or to the Eastern people. The East thought they could strike the Rocky mountains and not get themselves hurt. The Republican party, whose stock in trade is Protection to all industries, have belied their profession and made war upon an industry fraught with more consequences for weal or woe than any other single industry. Scarcely does any other industry so ramify every other. It calls for iron mines, lime, coal, charcoal, farms, railroads, machinery, and for laborers, without number, at high wages. It produces all the base metals as well as silver and gold, yet the Republican press of the East has done its best to down the industry, the New York *Tribune* being the most beastly of all in its warfare.

We now demand a financial system that shall *utilize* this grand industry—not only save it from ruin, but foster and encourage it. It was built up on the practice of ages and the implied faith of the Government.

The printing of unsound paper by the cord, which helps no industry, must stop. We must have a metallic currency—this will solve the problem. Away with all paper under $10, and let that be our $10 of gold and silver back of it. It would take many years to supplant the present volume of "unsound paper," which Stuart Mill calls "a form of robbery." Stop making merchandise of money metals! Let American silver go direct to the mints and be made sound by free coinage at 16 to 1, the time-honored ratio that miners know still exists as to risk and cost, and thus abolish quotations of bullion. Let the Government take the odd 29 grains, if need be, for seigniorage, giving the miner $1 arbitrary per ounce in bright dollars and half dollars, and they will be accepted by every miner and merchant in the Pacific States and kept in circulation.

The fight is still on. Let the battle cry be, No making merchandise of silver! American silver must go direct to the mint, no matter what the rest of the world does. This country is big enough to take care of its own productions and to maintain arbitrary coinage. Silver is a domestic money, always was and always will be. Gold always settled balances of trade with the gold countries and always will. GEO. PARTRIDGE.

San Francisco, November 5, 1893.

A Big River Mining Scheme.

Brief reference was recently made in the MINING AND SCIENTIFIC PRESS to a project of capitalists at Redding, Shasta county, to divert the Sacramento river at Turtle bay, and mine in the river bed for the distance of about one and a half miles. More complete particulars develop the fact that the enterprise is to be one of the largest ever undertaken in the State, and that the plans are now nearly perfected for the commencement of operations in the early spring on an extensive scale. The backers of the project are the Redding Electric Light and Power Company and the Redding Water Works Company, of which Francis Smith, the well-known pipe manufacturer of this city, is principal owner, and Fred H. Deakin and Walter Deakin, local capitalists. The enterprise is to be carried out through a combination of their various interests, including an irrigation project and the transfer of 500 acres of land now included in Fred H. Deakin's Riverside addition, within the corporate limits of Redding. No difficult engineering problem is to be solved, and advantage is to be taken of natural formation and certain works now already constructed for the diversion of the stream.

The general course of the Sacramento river is southerly, but at Redding it makes a broad sweep to the southeast and thence by an acute bend returns to the west, enclosing a peninsula made up of a great mass of auriferous gravel. In past times the river course was directly across the base of the peninsula, but it has for some time been gradually swinging to the east, leaving indelible proofs of its slow eastern progress in the great beds of gravel. The old course is clearly marked by a slough, which makes a direct cut across the peninsula from what is known as Turtle bay, on the south bank of the main river, to the point at which it swings from its westerly direction to the south. The direction of the slough is almost north and south and it forms the base of a rude right angle, whose legs are made by the river in its detour and whose apex is at the river's sharp turn from nearly southeast to west, making thereat an angle of about 60 deg. The base of the triangle is one-half mile long and the two legs nearly one and a half miles. With this explanation the nature of the proposition can be understood.

It is proposed to make an artificial channel north across the peninsula from its outlet to its inlet at Turtle bay. The gravel will be mined by sluices as work proceeds, and the excavation will be as near bedrock as possible. It is expected that the gold will pay enough to offset the cost of excavation, and that nominally, therefore, the expense will be little or nothing. The water will be turned into the artificial channel and the bed of the main river then mined.

In the river at Turtle bay the electric light company and the water company have already erected a shear-dam for the purpose of supplying a two-mile ditch, 30 feet wide at the top. This ditch is already built, and in an 18-foot fall gives 600-horse power to four water-wheels at the free bridge. Its location is west of the proposed cut. The shear-dam was built to turn a uniform volume of water into Turtle bay at all seasons of the year, whence it flows into the ditch without the means of headgates or other mechanical aids. The presence of Turtle bay makes the outlet of water from the river a comparatively simple proposition. It is an essential part of the scheme to extend the water company's ditch down the Sacramento valley, where it will be used for irrigating purposes. As outlined now, it is proposed to furnish about 32,000 acres of land with water. The course will be from Redding to Cottonwood, via Anderson, a distance of over 20 miles.

At the location of the shear-dam the Sacramento is about 300 feet wide, and is on an average about six feet deep at low water. The current is moderate. No exact calculation of the volume of water to be diverted has yet been made, but it will be seen that it is immense. The shear-dam is built about half way across the river, at an easy angle with the current. For the remaining distance, four stone piers are to be erected, and the dam will be made complete by heavy drop-timbers connecting the piers. With the approach of high water in the fall these timbers will be removed, and the water allowed to continue during the winter in its natural channel. The shear-dam and the piers are, of course, permanent. It is thought that at least four months each year can be devoted to uninterrupted mining.

The slough channel and the irrigation and water-works channel (the latter already partly built, as stated) are expected to be quite sufficient to dispose of the volume of water at ordinary stages. It will be possible to make the slough channel as large as desired. It is intended finally to work all the gravel between it and the natural river bed, on the east. Construction will be begun at the outlet. It can be carried on without the aid of a dam protecting against back-water at ordinary stages of water.

The value of the gravel in the river bed is not definitely known, but it is without doubt great. Mr. Fred H. Deakin recently caused a shaft to be sunk fourteen feet at the river's edge with the aid of powerful pumps. The gold became heavier at every foot. A nugget worth $30 was obtained near the bottom. At the surface the gravel will unquestionably pay well. It is stated that a scow on the river above Redding, with dredge, water-wheel and sluice boxes, is making from $25 to $50 per day. It is a common thing at Redding for miners to take a pan, wade out waist deep into the stream, scoop up sand and gravel, return to the shore, and work it in a rocker. In this rude and laborious way, $2.50 and $3 per day are realized regularly per man. The exact distance to bedrock is not known.

The originator and chief promoter of the enterprise is Mr. Fred H. Deakin, who has business interests in San Francisco and in Redding, besides being the owner of about 43,000 acres of timber land in California. As long ago as 1886 he acquired land adjoining the river and has been at work ever since to consolidate the various interests and bring into working shape the project then contemplated. Mining claims have been located along the river in due form, and the land on the east as well as the west banks acquired, to prevent any possible complication with riparian owners. The Sacramento is unnavigable at Redding and no objection on the part of the Government is to be feared. It is expected the corporation will be completed within 30 days, under the name of the Northern California Development Company, with the following officers: President, Francis Smith; vice-president and general manager, Fred H. Deakin; superintendent, S. P. Fillman; secretary, L. Fillman; treasurer, R. M. Saeltzer. The Redding water works and electric-light plant will be a part of the assets of the new organization. Mr. Deakin is somewhat proud of the fact that the company will be controlled and operated wholly by Americans and American capital. Financial aid for such enterprises, as is well known, is frequently sought in England.

Mine Surveying—The Mine Corps.

The method of dividing the work in an underground survey depends on the size of the corps, writes Prof. Edward H. Williams Jr., in the *Colliery Engineer*. We will, therefore, consider the work of each man in order to get the right number for the corps. The chief of the party should be where he can do the most good, and where he can plan the work for his subordinates. The principal point of the survey is the setting of the stations so as to do the work thoroughly with the fewest set-ups, so as to diminish the chances of error in instrumental work. The chief should locate the stations and add all the necessary signs to show how the work is to be done. The transitman should not have his attention distracted from his par-

ticnlar work by questlons as to procedure. He should work nntrameled. The chief, therefore, shonld not rnn transit. Upon thls basls the ideal mine corps works, and such a corps consists of at least four, and better five, men from the office, and three from the mine. It is divided into two sections. The chief takes the men supplied by the mlne—one or more of whom are acqualnted with the work done since the last survey—and locates the stations; the transitman follows with the second sectlon to measure angles and dlstances. By this time the stations are set and the chlef takes his men after the transit party and gets the side notes wlth a check measurement of the distances between stations.

Such a corps goes to the end of the former survey and ldentlfies the two last stations. The transitman prepares to set up at the last, whlle the chief and party go as far as they can see the llght from the last station, or to some lntermediate point from which one or more slghts are to be taken. He then stops and sends a man along each place where a sight must be taken, as long as thelr lights are plainly seen from top to bottom where he ls standing, and over this place he marks a point for a station to be lnserted, and generally lnserts it himself unless he be pushed for work, and must leave lt for another to do, when he places a circle about the dot, places the nnmber at the side and as many arrows as there are new statlons, the longer polnting to the sight to be last taken and where the transit is to be set up next. Leavlng a back slght at the point just set, he sets successlvely stations at the points where the foresight men have stood ln the manner just described till he has covered the new work, the mine boss or some intelllgent miner going with hlm to give hlm an ldea of the "lay of the ground," so that the work can be covered with the fewest number of stations. Sometlmes the chief takes the sldenotes and measures the distances between stations as fast as they are set. If on a pitch, a clrcnlar brass protractor with small plummet is hung at the center of the stretched tape to give the angle at which lt is held to serve as a check to the measurements of the translt party, which are taken as the basls of the work, and the other measurements are solely as checks. In flat work both measurements should colncide.

In a small corps, and where time ls of little lmportance, the foresight man puts in the stations ahead of the transit, and, while he ls so doing, the transltman takes the side notes. Sometimes the side notes are taken by the same man while one of the party is taking the transit to the next station and settlng it up for the next sight. There are about as many variatlons from these two methods as there are corps.

The foreslghtman should be intelligent and active, as the amount of work done in a day depends npon his ability to keep ahead of the transltman. Some of the latter are fast enough to keep two forsightmen on the jump. His duty is to set the center of the next set-up under the station, and also place the tripod if three are used in the work, to give the slght, and, ln some corps, to carry the front end of the tape and assist in taking the distance. In some corps he also carries the bag with tools for setting stations, so that he generally has a load that makes rapidity of movement difficnlt, and anything that will dimlnish the weight carried will tend to quicken the work.

The rapidlty wlth which good work is done varies conslderably, but it depends upon the activity of transit and forsightman, and a good corps, should have no trouble in making 12 set-ups an hour, and taking two or three sights from each set-up. It varies also with the distances between stations. The saving of time should never be sought at the expense of accuracy ln the work; it is to be gained by rapldity of moving about; in setting transit, center, etc., and ln hanging plummets to give sight. The fore and back sightmen should be in position to give slght before the transitman is ready, so that he can turn hls instrument on one and the other and find them in posltion. The slowest parties were those that carried empty powder kegs (in the days when loose powder was allowed lnside) for seats and spent the greater part of the time sitting on them.

The backsight has little to do inside, and to compensate for this, he is the one who cleans and oils the tape, gets out new plnmmet strings and sees that the tools are ready for the next work, as soon as the corps get to the office.

The transitman cleans the transit, unless the corps has subordinates who can be trusted with so delicate an instrument. The blackening from sulphuretted hydrogen is rubbed from the slivered surfaces with whiting, and the oil or palnt smears are removed wlth alcohol. Alcohol should be used instead of water for cleaning the instruments, and especially the lenses, which are wiped with jeweler's cotton or soft chamois skin.

THE famous Utica quartz mine at Angels broke the record of its monthly yields in October, the clean-up amonnting to $182,000: $111,000 of the treasure was in 100-pound bars.

The Story of Marshall's Find.

A correspondent (E. R. C.), writing to the *Bulletin*, gives an account of the discovery of gold in the tail-race at Sutter's Sawmill, as told to him by John A. Sutter and Mrs. Weimar, the parties after Marshall most directly concerned and cognizant of all the surrounding circumstances.

The writer first became acqnainted with Captain Sutter at the Niantic Hotel in San Francisco early in 1852, aod from hlm had a very full and graphic account of the gold discovery at Coloma, going into all the details connected with this event.

Without repeating what ls famlliar to most readers regarding this discovery, about which so much has been written and published, the writer will confine himself to the old pioneer's account of Marshall's visit with the gold specimens picked up at the mill, and the tests applied to determine their genuine character. Marshall came to the fort at Sacramento early one morning in the latter part of January, 1848, having ridden the greater part of the night before from Coloma, and with an air of mystery requested a conference in Sutter's private office. Upon entering he locked the door, to exclude outsiders, of whom there was at that time a large number. Taking from his pocket a pouch which he opened, displaying quite a number of shining particles of yellow metal, to quote Sutter's exact language, he asked in an excited manner: "Ish not tish gold?" The narrator added that the only test available was nitric acid and all the authority at hand bearing upon the matter was a copy of the "Encyclopedia Brittanica."

Upon applying the acid the true character of the metal was established beyond a doubt. Sutter then requested Marshall to keep the matter secret until the mill was completed. As there were eavesdroppers, attracted by Marshall's mysterious manner, who had heard the conversation, this was an utter lmpossibllity. The news spread like wildfire, and the frame of the old mill stood for years a monument of this startling event. The ground once occupied by this relic, with the twin pine trees standing near by, has long since been moved over and over again, and not a vestige of the orlginal structure remains.

The next party from whom the wrlter had an account of this discovery, detailed a few months later, was the wife of Peter Weimar, who was employed in building the mill, and with whom Marshall and others engaged ln the work boarded at the time. Welmar died aged 82 years, at the residence of a brother-in-law in San Luis Obispo county, on the 16th day of August, 1892, the death of his wife occurring a few years previously.

According to her account Marshall, having gone to the mill early in the morning to shut off the water left running through the tail-race the night previous, in order to wash out the sand and save excavation, discovered the nugget in question shining through the water in the crevice of a rock, and, exhibiting it, expressed the opinion that lt was the precious metal. The Weimars, who were from the gold region in Georgia, concurred ln this opinion, but in order to test the matter more fully Mrs. Weimar stated that as she was making soap at the time she threw the nugget into the boiling alkali and with lt a ring she had purchased for gold some years previous.

The soap being sufficiently "cooked," the lady having had the proverbial "luck" which attaches to this important chemical compound, the kettle was set aside for the article to harden. A short time after Marshall according to the lady's account, made the lnquiry: "Jenny, what's become of our gold?" Thereupon she proceeded to cut out the customary squares, and then with bared arm picked out from the caustic alkali sediment the nugget and the ring. While the former was brightened by the process, the latter was corroded and almost eaten np by the caustic llquid. Then lt was that Marshall, gathering up a number of particles of the metal, set out post-haste for Sutter's Fort.

Some accounts have stated that Mrs. Wlemar claimed that her husband first made the discovery, but she did not assert such claim at the time she gave this account to the wrlter. This lady stated ln this connection that Barnum had offered $500 for this specimen, which weighed a fraction less than $5. Both the writer of this and the party by whom he was introduced advised the acceptance of this offer of the world-renowned showman. The lady on this occasion mentioned that she had often bartered with the Indians, who were numerous at that time, a handful of hard bread for a handful of gold, and the same rates were willingly paid for a yard of calico.

The account given the writer a few years later of his discovery, by Marshall, did not differ materially from that of Sutter and Mrs. Wlemar. There seems to be a doubt as to the exact date of the finding of this nugget. Members of the Society of California Pioneers of this city have been ln correpondence with their Sacramento brethren in relation to this matter, in order that some definite day may be fixed npon to celebrate the event. The writer's lmpression is that Marshall stated that the find occurred on the 19th of January, 1848. Dr. W. W. Light, a member of the Sacramento Pioneers' Association, who was intimate with Marshall, corresponding with him up to the time of his death, and who was shown by him the precise spot from which the nugget was taken, entertains the same opinion.

The writer of this, a few weeks ago, in company with the gentleman named, visited Sutter's Fort, which has, with the surrounding walls, been rebuilt, constructed of adobes manufactured on the ground, and surmounted with tiles from an adjacent pottery. Many relics of the gold-finder and the old commandant are displayed in the main building, but it is extremely doubtful whether, if either were permitted to "revisit the glimpses of the moon," they would recognize the old fort in its new dress. E. R. C.

Hirsh's Aluminum Process Again.

J. M. Hirsh, who has had a more or less pyrotechnic career in promotion of a certain mysterious aluminum process in Chicago aod New York, has turned up at Ellensburg, Wash., where he has organized the Washington Aluminum Manufacturing Company, the incorporators of whom are J. M. Hirsh, of Chicago, and W. H. F. Briggs, A. H. Stulfauth, T. T. Wilson and W. A. Bull, of Ellensburg. The principal place of business will be at or near Ellensburg, and the works will be located at or near Thrall, in Kittitas county. Speaking of the organization and the principal promotor, the Ellensburg *Capital* says:

"Material carrying a high percentage of aluminum has been definitely located near Ellensburg in large quantities, and this company is the outcome of the discovery. J. M. Hirsh, one of the incorporators, is the well-known manufacturer of aluminum in Chicago, and he is equipped for the enterprise with plenty of experience and a financial reputation that is bound to add strength to any enterprise he may connect himself with."

J. M. Hirsh occupied quite a large share of public attention in metallurgical circles about two years ago. He claimed to have discovered an electrical process by which aluminum was deposited from an aqueous solution, and that the value of the practically exclusive method owned by the Pittsburg Reduction Company would thereby be greatly reduced, if not destroyed. The Chicago Aluminum Manufacturing Company was organized, and the capital and interest of several persons were enlisted. Five thousand dollars were advanced to Hirsh. He rented a five-story building on West Twelfth and Rockwell streets, Chicago. But little work in actually producing aluminum appears to have been done, and little or no use was made of the five-story building. Hirsh's backers became impatient. They waoted him to go to Washington and take ont a patent on his process. He refused. But he went to New York, where his movements aroused the suspicion of those interested with him. He called upon a well-known chemical expert and showed him an ordinary faucet, said to be plated with aluminum, and asked to have the plating tested. The test proved that the plating was aluminum. Hirsh then represented that the chemist (Francis Wyatt, Ph. D.) had endorsed his process. He subsequently caused a letter to be printed in the Chicago *Herald*, signed by Wyatt and addressed to Hirsh, unqualifiedly commending the process. Mr. Wyatt had indeed written a letter to Hirsh's brother, a close friend of Wyatt, giving the result of the analysis and including these words:

"I am entirely at your brother's (J. M. Hirsh) disposal to witness and report upon any experiments he may desire to make in my presence, but, as I told him in the plainest possible language, I will not put myself on record until I know exactly what I am talking about, and exactly how I am to fight the battles that I know must follow my publication."

These expressions Hirsh deliberately expunged from the letter he professed to have received from Wyatt. His action was denounced by Wyatt, who declared his lack of confidence in Hirsh and his process.

There were many other features of Hirsh's record that might prove interesting to the public and to his new associates at Ellensburg, but they would take up too much space. Hirsh always refused to disclose the nature of his process to aoy one or to perform any experiments in the presence of competent chemists. In New York he made frequeot calls at the International Aluminum Works, they state with the apparent object of getting information about their methods. Hirsh got into trouble with his associates by starting a new company with $2,000,000 capital and giving it the right to plate with aluminum, claiming that the original organization was only to maoufacture the metal in bulk. The Chicago *Daily News* exposed Hirsh Jan. 14, 1891. Hirsh's backers claimed to have given him $15,000, but he wanted $100,000. They believed in Hirsh because he showed them the aluminum he claimed to have manufactured. It would be well for the Ellensburg people to know exactly what Hirsh's method is, and who Hirsh is, before they indorse him and his process.

Mechanical Progress.

Jet Boat-Propulsion.

A London weekly recently pointed out why jet propulsion of boats, which has recently attracted some attention, will never equal the screw or paddle-wheels for efficiency.

The chief reason is this: The power in a boat or self-navigating ship is not applied quite as on the locomotive. The driving-wheels of an engine take hold of a fixed base, and thrust against it, or a series of such bases, all the while. But the mechanical appliances used in propelling a vessel at sea act upon an extremely mobile mass; something that tends to slip, and does to some extent slip away from them. It is only because the weight or inertia of the portion immediately in contact with the oar, paddle-wheel or screw offers some resistance that any headway is secured; and the larger the watery bulk acted upon the more stable it will be, and hence the more progress will be secured. Now an equal amount of power may be consumed in moving a little water a great distance astern and a large amount a small distance. In the former case, however, the leverage is almost lost; and in the latter it is largely retained. Consequently it is desirable to apply the power so as to strike broad surfaces rather slowly, instead of small ones with great velocity.

Another minor consideration is worth mentioning. In the jet system water has to be pumped into the moving vessel before it is ejected; and a certain amount of force must be consumed in giving to it, in the interval, the forward motion which every other object inside of the craft has. This subtracts from the amount of power available for propulsion.

To Improve Lard Oil.

A few years ago, having to use lard oil for lubricating purposes, and finding it to gum on cast-iron surfaces so much as to be detrimental, and imagining that the gumming quality in the oil was gelatine, I filtered a quantity of it through tannic acid, says a writer in the *Engineering Magazine*. This certainly improved it, but was expensive. Now, lard oil is without doubt one of the best lubricating oils known, but it will get gummy with the conditions above named, and I have looked for many years for a means to rid it of its sole evil element. Recently, having occasion to experiment with an oil filter, I noticed that one of the printed directions is aimed toward the fact that too much heat in the water with which this filter is charged will coagulate lard oils. I find this to be a fact, and, further, that the coagulated particles will precipitate, and after a few days be found at the bottom of the oil. The oil then can be poured off, and it seems to have parted with its gummy quality. If others will try this, and if they find the same result, an improved lard oil is possible, and the improvement will be a cheap one in respect to its first cost.

The New Navy Rifle.

The new rifle for the navy is 0.234 of an inch caliber, the smallest regularly adopted by any government. The caliber of the French Lebel rifle is 0.315; the German Mannlicher is 0.311; the Danish Krag-Jorgensen is 0.315; the English Lee-Speed, 0.303; the Swiss Schmidt, 0.295; and our new army model, 0.30. The small caliber is recommended by the ordnance authorities on the ground that it will give higher velocity, greater range, greater penetration and greater accuracy than the 0.30, with the added advantage of allowing the men to carry a greater supply of ammunition. The disadvantage is the lack of interchangeability of ammunition between the two services. In the last few years the reduction in caliber has been phenomenal. The English Martini and the old Springfield rifles were 0.45, the famous Chassepot of France 0.433, the Russian Berdan 0.42. The department will, if necessary, furnish the barrels for the manufacturers to apply the breech mechanism. The barrels will be made of nickel-steel alloy.

Cutting-Tool Wear.

Cutting tools on metals do not always wear to the extent they are supposed to wear, says the *Engineering Magazine*. Ordinarily they are burned by too great a speed. It may not be amiss here to explain what this burn is. When two pieces of similar metal are moved, the one upon the other, while held together with considerable pressure and without a lubricant, they soon will weld together at the point undergoing the greatest strain and friction. Thus, an iron shaft in an iron box becomes cut or galled, and thus the point of a steel tool when cutting iron is often taken away after doing but little work. Dissimilar metals do not burn each other to so great an extent. When an iron shaft is contained in a box of bronze, one metal being no harder than the other, they seldom or never unite; therefore a steel tool can cut brass or hard bronze at very high speeds. In planing cast steel it is questionable whether a speed above 12 feet per minute is safe, but in cast iron, where graphite is present in the iron, it lubricates the tool, and sometimes it is safe to cut 20 feet each minute through the material.

To Renew Old Belting.

A machine has been invented which is expected to strengthen old belting. As described in the *Journal of Commerce* the machine consists of two large, hollow copper cylinders. Steam is admitted into these cylinders and so they are always heated. In a tank there is a solution made of beeswax, borax, glue, starch and molasses, prepared in equal quantities. The solution is in liquid form. There are guide rollers, and the leather belting which is in process of treatment runs through them. The belt to be operated upon is started into the machine at a point where it can enter the tank, and while passing through this tank the leather receives an application of the solution. The press rollers immediately squeeze the compound into the fiber of the leather and then the heat from the cylinders, over which the belting is being drawn, dries the compound. All the rollers and cylinders rest in the bearings. The result of applying this compound to the belt and immediately drying it is said to add strength to the fiber of the leather to a remarkable degree.

Austrian Concrete Tests.

The Austrian Society of Engineers and Architects has recently been making tests of concrete for arches. In every case the span was 13.3 feet, and the rise (with one exception) 15¾ inches. It was found that the breaking load for a brick arch six inches thick was equal to 321½ pounds per square inch. A concrete arch four inches thick was ascertained to be of more than double that strength, as the load was 737⅓ pounds per square inch. A concrete arch only 2⅜ inches thick, with iron rods along the intrados, was equal to 839 pounds to the inch. When steel joists 3⅛ inches deep, bent to the curve, were imbedded in a concrete arch of the same depth, and with a rise of 11 inches, a breaking weight of 3360 pounds per square inch was required.

A Novel Gun.

The recent successful test, as announced, of a small copper model gun, tempered by the process invented by Allard of Quebec, has attracted considerable attention, says the New York *Sun*. Before firing the gun was carefully gauged at two different points, one and two inches from the breech end of the powder chamber. In the first experiment the gun was charged with three-fourths of an ounce of sporting powder, and wadded with a plug of paper driven well home with a mallet. After firing the charge the gun was examined and gauged at the above-mentioned points, and the diameters were unchanged. The next test was a very severe one, one and three-fourths ounces of sporting powder being used, leaving only sufficient room for a plug of paper, which, as before, was driven hard home, filling the piece to the muzzle. This charge was fired with Bickford fuse, and subsequent examination of the gun showed no flaw or perceptible expansion.

Scientific Progress.

Is It a Fault of the All-Wise?

Sir Isaac Newton, who preceded Laplace by about a century, had found evidence, as he claimed, that the material universe is the work of an all-wise designer, says Daniel Kirkwood in *Popular Science Monthly*. The author of the Mecanique Celeste, the greatest mathematical astronomer of his age, seldom discussed questions of a moral nature; but, not accepting Newton's views, on the doctrine of final causes, or the doctrine of design in the material world, he took occasion to point out a so-called failure of nature in adapting means to ends. If the moon was designed to give light by night, the purpose, he said, had largely failed, and he (Laplace) could suggest a better plan. But the entire passage is quoted as follows: "Some partisans of final causes have imagined that the moon was given to the earth to afford it light during the night. But in this case nature would not have attained the end proposed, since we are often deprived at the same time of the light of both sun and moon. To have accomplished this end, it would have been sufficient to have placed the moon at first in opposition to the sun, and in the plane of the ecliptic, at a distance from the earth equal to the one-hundredth part of the distance of the earth from the sun, and to have impressed on the earth and moon parallel velocities proportional to their distances from the sun. In this case, the moon, being constantly in position to the sun, would have described round it an ellipse similar to that of the earth. These two bodies would then constantly succeed each other, and as at this distance the moon could not be eclipsed, its light would always replace that of the sun."

Features of the Moon's Face.

Mr. Gilbert's address as retiring president of the Washington Philosophical Society is an array of arguments in favor of the impact theory to account for the origin of the features of the moon's face. His hypothesis is that material constituting the moon once surrounded the earth in the form of a Saturnian ring; that the small bodies of this ring coalesced, first gathering around a large number of the nuclei, and finally all uniting in a single sphere, the moon; that the lunar craters are the scars resulting from the collision of the moonlets.

This hypothesis reconciles the impact theory with the circular outline of the lunar craters, and explains the abundance of colliding bodies of large magnitude, says the *American Naturalist*. The author discusses the probabilities of the formation, according to his theory, of lunar wreathes, central hills, arched inner plains, level inner plains, and the association of inner plains with central hills. He finds his theory adequate to explain all these phenomena, as well as the peculiarities known as furrows, sculpture, rills and rill pits. In regard to the "white streaks," Mr. Gilbert quotes, as in accordance with his own idea, an unpublished suggestion made by Mr. William Wurdeman, that "a meteorite (moonlet) striking the moon with great force spattered whitish matter in various directions."

During the growth of the moon, many moonlets must have collided with the earth and formed impact craters which have been obliterated by erosion and sedimentation. It is possible, the writer suggests, that these collisions imitated not only the differentiation of continental and ocean plateaus, but the series of geographic transformations of which geologic structure is the record.

Chemical History of the Atmosphere.

Dr. Phipson gives in *Chemical News* the chemical history of the atmosphere from its origin to the present day, in accordance with the results of his observations and experiments. Premising that the matter composing the earth was originally in a gaseous condition at such temperature that no compounds could exist, he assumes that, when a solid crust later covered an internal molten mass, water was condensed upon the surface and a primitive atmosphere of nitrogen surrounded the globe. Into this atmosphere large quantities of carbonic acid and water were evolved by volcanic action, but there was no free oxygen. Plants then made their appearance, and, in vegetating, evolved oxygen copiously, deriving this element from the carbonic acid supplied by volcanic action. When a certain proportion of oxygen was attained, animal life became possible and duly appeared. At the same time the proportion of carbonic acid became less, the carbon being stored up as coal, peat, lignite, etc. As these processes proceeded animal life of higher order appeared, the development of the nervous system coinciding with the increase of oxygen in the air. As evidence that the composition of the atmosphere is still slowly changing, it is stated that the latest and most careful determinations of carbonic acid in the air have shown a decided decrease (0·05 to 0·03) in the last 50 years.

Isolation of Fluorine.

The complete isolation of fluorine by a French scientist is a recent chemical triumph which has excited much interest. Fluorine, as described for the popular understanding, has a smell resembling that of hypochlorous acid, which is somewhat masked by the odor of ozone, from its action on water vapor, says the New York *Sun*. It, of course, acts powerfully on the respiratory organs, even when greatly diluted, and it causes insensibility, lasting as long as a week or more, of the mucous membrane of the nose.

It is of a yellowish green color, somewhat lighter and yellower than chlorine. It combines explosively with hydrogen, even at a great cold and in the dark, and sulphur, selenium and tellurium take fire in it at ordinary temperatures. Bromine and iodine burn in it with a flame at low temperature, and amorphous carbon, amorphous boron, and especially crystalline silicon, with the evolution of great heat. Many other substances burn in it, oxygen and nitrogen appearing to be the only elements with which it does not unite.

Chemicals in Extreme Cold.

That extreme cold paralyzes every vital function is, of course, a piece of every-day knowledge, says the *Journal of Commerce*. But it has been left to Prof. Pictet, who has been conducting some experiments on this subject, to discover that at a temperature of 150 degrees below the centigrade zero there is no chemical action between nitric or sulphuric acid and potash, between oxygen and potassium, though under ordinary circumstances the affinity of the latter metal for oxygen is so great that it will burn if thrown into water, owing to its combination with the oxygen in the fluid. But if the electric spark is played on bodies which have thus lost the power of chemical affinity, some new and curious combinations result.

The latest investigations, the conclusions of which, however, have been theoretically presaged for some years past, may require us to consider the question of the temperature of outer space and the possihility of an atmosphere composed of gases in combination existing there.

Scientifio Notes.

Upward of 60 per cent of the earthquakes that have heen recorded have occnrred during the six coldest months of the year, the maximum number in January and the minimum in July.

Mr. Morris Gibhs has shown that the songs of birds remain the same, regardless of the psychological state of the singer. This conclusion is based on observations made on 50 species of song birds.

Mr. Clarence King, the well-known geologist, has computed the earth's age on the hasis of experiments made, on the effect of heat and pressure on certain rocks. Mr. King concludes that the earth's age as a planet ls 24,000,000 years.

A member of the Royal Meteorological Society has experimented on the size of raindrops, which vary from a speck so small as to he almost invisihle up to a diameter of two inches. Drops of the same size do not always contain the same amount of water. Some of the largest drops are hollow.

Nature, quoting a correspondent from Lahore, India, says: "A few days ago, in a village named Daduzal (in the Pashawa district), rain fell, preceded hy a wind storm, and with the rain came a shower of hailstones, which lasted for an hour and a few minntes. The most curious part of this occurrence is that the hallstones, when touched, were not at all cold, and when put in the mouth tasted like sugar.

Another Arctic expeditlon is to start from the United States next year. It is to he under the leadership of Robert Stein of the geographical survey, and lts object is the exploration of the territory to the north of Baffin's bay and the west of Smith's sound. Eight men will form the party, and will go hy steamer to Jones' sound, where a supply station will he erected. From that point the party will explore as far as possible to the north and west.

Contrary to the opinion of eminent geologists, Prof. Bonney contends that glaciers exert no excavating action, and thls conclusion he bases on facts observed by him in the Swiss Alps. He had followed up many of the valleys in Switzerland, and the work of the glaciers in every instance should, he believes, be classed rather as abrasive than erosive. In the absence, however, of the erosive theory, it will he difficult to account for the present character of many of the lochs on the west coast and in the interior of Scotland.

In one of his remarkable lectures, Tesla states that most scientific men now look upon the varlous forms of manifestations of the same nature as those of radiant heat and light. The phenomena of light and heat, and others heside, may therefore be called electrical phenomena, and thus it is that electrical science has become the mother science of all and lts study all-important. The day when we shall know exactly what electricity is will chronicle an event probably greater and of more moment than any other recorded in the history of the human race.

Wing Area of Flying Animals.

M. de Lncy, a French naturalist, has shown that the wing area of flying animals varies from about 49 sqnare feet per pound of weight in the gnat and 5 square feet in the swallow to half a square foot per pound of weight in the Australian crane, which welghs 21 pounds and yet flies well. If we were to adopt the last or smallest proportion, a man weighing 12 stone would require a palr of wings each of them 14 feet long hy 3 feet broad.

Langbein's Splendid Book on the Electro-Deposition of Metals.

A New Revised and Enlarged Edition.

NEARLY READY.

A COMPLETE TREATISE ON THE

Electro-Deposition of Metals

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brannt, Editor of the "Techno-Chemical Receipt Book." Illustrated by 138 engravings. A New and Thoroughly Revised and Enlarged Edition. In one volume, 8vo, about 440 pages. Price....$4.00

☞ *Free of postage to any address in the world.*

☞ *A circular of 6 pages quarto, giving the full Table of Contents of this splendid Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish us with his address.*

☞ *Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

Electricity.

Electricity by Water Power.

No invention of modern times, unless it was the steam engine, has exerted such a far-reaching influence over the distribution of population as that of Sir Henry Bessemer in his process of making cheap steel, says Oscar Bradford in the *Economist*. The steel rail has enabled railroad companies to increase the weight and carrying capacity of their rolling sock and thereby so reduce the cost of freight that the farmer of the Mississipi valley could lay down his products on the Liverpool market at prices lower than any competitor. This demonstration was at the bottom of an emigration that astonished the world. Under its influence population was pushed westward nearly to the base of the Rocky mountains and to the extreme limit of the rain belt. The Bessemer converter really gave to Chicago its million and a half of people and insured growth and prosperity to St. Paul and Omaha, St. Louis and Kansas City. With a fertile soil were combined the advantages of cheap coal for heat, light and power. Water and rail transportation seemed to indicate that in the Mississippi valley and on the plains of Kansas and Nebraska there existed all the elements necessary to create an empire unequaled for numbers and wealth in the history of the universe.

But shrewd observers see in the immedlate future the commencement of a movement destined to reach proportions beyond precedent. They see conditions which insure the birth of a new and greater empire as the result of another invention—the dynamo. No one need be told of the advances made by electricity as an aid to human effort in the past ten years, even under the discouragements of undeveloped appliances and expensive fuel. What will it be with perfected mechanism and no requirements for coal? What cannot be said in favor of a country where heat, light and power are practically free, where habltations are maintained at a comfortable temperature for next to nothing, where night can be turned into day by the luminous carbon, where the cooking is done by the turning of a switch, and machinery harnessed to unlimited power, all through the agency of a waterfall inexpensively trained to man's use by a turbine wheel? Add to these advantages a soil so rich that it would manure the blackest loam in Illinois, a climate so healthful that disease is almost banished and rainfall a manifestation to be controlled independently by the will of each cultivator; locate mountains of gold, silver, copper and lead ores, of coal and iron, every variety of building stone and sand and clay without limit; find thousands of square miles of valuable timber, broken and threaded by beautiful lakes and running streams, and there you have the Rocky mountain region, extending from the northern border to Arizona.

It is evident that under such conditions a comfortable existence can be maintained with the least effort, hence the certainty that with the return of financial ease a mighty movement of population will be headed toward the setting sun. That a hunger for land exists is evidenced by the contentlous strife of the lnvaders of Oklahoma and the Cherokee strip. What may be expected when the people realize that millions of acres may be had for the asking in a country which irrlgation will make as fruitful as the Nile valley and where on all sides never-failing waterfalls solicit work? What boundless opportunities will capital find for investment in the canals and electrical developments, in the railroads to be called into being by the enormous traffic and in the rapidly enhancing town and country property?

The possibilities of the subject are exhaustless, and they will soon be written in the throng of emigrants and capitalists westward on settlement and profit bent, in the swelling tide of popnlation which will enliven the mountaln valleys and make of Helena and Spokane, Salt Lake and Denver, cities in which the wealth and power of the republic will find no grander expression.

The Chloride Accumulator.

A type of storage-battery accumulator which has been tried with excellent results in France, and is about to be produced on a large scale in England, was recently described by Mr. Herbert Lloyd before the Franklin Institute in Philadelphia. It is called the "chloride" battery, not because chlorine plays any part in the actual working of the cell, but because that element is utilized in preparing the metal.

Two objects are kept in view in making the positive plates of a storage battery: (1) To present as large a surface as possible in limited space, and (2) to confine the "active material" (the peroxide of lead which is formed on that surface by chemical and electrical action) so that it will not fall off and collect in the bottom of the cell. The system just referred to consists of melting chloride of lead and chloride of zinc together, casting plates or tablets of this mixture, framing these in borders of antimonious lead, and then chemically extracting the chloride of zinc and the chlorine from the lead compound, thus leaving the lead as a very porous fabric. The extraction is performed by electrolysis, in a bath of chloride of zinc. The reason for putting the zinc into the alloy in the first place is that chloride of lead alone cannot be moulded; but with an admixture of chloride of zinc it becomes more manageable.

After the porous lead plate is thoroughly cleaned, it is converted into peroxide of lead by immersion in the usual weak acid bath and the application of electricity. The positive plate is protected by a covering of asbestos cloth; and between this and the negative plate is interposed a grooved perforated board of insulating material, which is pressed against the asbestos cloth. Thus the peroxide is held firmly in position, and free circulation of the fluid employed is permitted. One virtue of this system is that less of this latter than usual is required, and there is not much danger of spllling, with any shake or jolt, as often occurs on street-cars propelled by storage batteries.

To Indicate Underground Faults.

An ingenious instrnment for automatically indicating the place of a fault on underground conductors is being used in Berlin. An alarm is sounded at the central station the moment a fault is developed, and the location is indicated at the same moment. The usual pressure wires are used, and are so connected that a certain difference of potential exists between the copper conductor and the pressure wire. When a cable ls damaged the short circuit which then occurs between the pressure wire and the copper conductor produces a change in the voltage existing between them, which in turn actuates a relay and an alarm at the station. the relay also controls an annunciator, which denotes the position of the fault by the dropping of a square devoted to the district affected. The further efficiency of the underground electric service in Berlin is maintained by ground detectors at the station, which show the condition of the insulation, not only of the whole network, but of every single district.

Generating Heat in Water.

One of the most striking things on exhibition—remarkable on account of being so entirely out of harmony with all our ideas of the conditions under which we expect to see heat generated—is the apparatus to be seen in the exhibit, which may be appropriately termed the "water-pail forge." This consists of an ordinary wooden pail filled with water into which dips a metal plate connected with one terminal of electric circuit.

The other terminal is attached to a pair of blacksmith's tongs, with which the operator picks and holds the piece of metal to be heated. Immediately upon his plunging this into water the liquid begins to sputter and the metal to glow, until in a few seconds it is brought to a welding heat and is then speedily melted. The heatlng is so rapid that neither the water nor the metal a few inches away are more than slightly warmed. This curious phenomenon appears to be due to the localization of the resistance of the circuit at the surface of the heated metal by the lnterposition of a layer of hydrogen between the metal and the liquid. This is the explanation offered by two Belgian engineers who recently brought ont the process abroad with apparently no knowledge of its prior use in this country.

Curious Effect on Nerves.

The oscillating discharge from an electrostatic machine is said to have a peculiar physiological effect on the sensory nerves, enabling their distribution over the surface of the body to be determined by a novel and most sensitlve method. If the ball terminals of the machine are grasped in the hands nothing is felt when a series of the sparks is passing from the exciters, but if the discharge be localized on the body by means of a blunt point, whenever that point passes over a sensory nerve, the nerve is excited throughout, and a vivid sensation is experienced. The least displacement of the electrode to one side or the other causes this sensation to cease. Dr. Stephane Leduc, of the Nantes School of Medicine, claims to have made this interesting discovery.

Its Heat Not Useful.

Experiments have recently been made with a view of determining whether the qnantity of heat developed in the rheostat —which is one of the necessary evils in the operatlon of electric-railway motors—is sufficient to be of any practical assistance in warming the atmosphere of the car. The conclusion arrived at was that the amount of heat which could be thus realized is not sufficient to warrant the expense of providing special rheostats. Incidentally, however, says the *Engineering Magazine*, these resnlts go to show that the actual loss of power due to rheostatic regulation, as compared with commuted field-windings, is much smaller than has usually been assumed.

To Prevent Pipe Electrolysis.

The question of protection of underground pipes from electrolysis has recently occupied a share of attention in electrical papers. An English firm points out that by coating the pipes with two coats of anti-sulphuric enamel a complete protection is assured. This material is an elastic composition, which has been used for this purpose with the greatest success, as it is not only a perfect insulator, but, being unaffected by acids, earth salts and moisture, it is both more serviceable and effective than the tarred hemp and japan usually brought into requisition. It can be easily applied and dries rapidly.

Best for Conductors.

A prominent English engineer contends that experience has shown that silicon-bronze is the best material for electric-light and power conductors. The spans may be made 50 per cent longer than even with iron, while less costly insulators are required. This metal is already largely used abroad for telegraph and telephone lines.

Useful Information.

The Ideal Editor.

A recent address on "Journalism," by C. A. Dana, editor of the *Sun*, is full of shrewd suggestions, not only to editors, but to the large portion of the public who think that they know better how to run a newspaper than does the editor. The sum of the address is that an all-round education is essential to the highest success. What Cicero said of the orator is still more true of the editor. No kind of knowledge fails to be useful to him. Yet he must have versatility of mind to make his knowledge useful, besides a quickness of perception gained only by experience that enables him to decide promptly what will interest the part of the public that he reaches. The ability to see and report a fact exactly as it is cannot be dispensed with. In short, the editor must be one who has the widest human sympathies, and, if he would influence the world, as should be the generous ambition of every writer, he must become interested in politics, theology, and all other forces that affect human progress. A man without this ideal may be a successful writer, but he cannot be a successful editor.

Queer Rain Theory.

A most extraordinary theory has recently been propounded to show the reason why rain usually falls after a severe battle has been fought, says the Boston *Globe*.

The ancients used to attribute the phenomenon to the generosity of some deity, who was kind enough to make the attempts to wash away the traces of men's degradation as soon as possible; and later on, when cannons came to be used as a means of destroying life, the detonations of these machines were said to cause the wonderful downpour of rain.

But more prosaic, up-to-date people of today put it down to perspiration. And this is how they go to prove it:

One soldier will in the course of 12 hours' fighting give off six gallons of water. He drinks much; thirst for gore, glory and water go together on such occasions, and the total amount of moisture given off by one man is said to be sufficient to cover 12 square feet three-quarters of an inch deep.

Now, of course, all this perspiration evaporates and goes up into the atmosphere. The atmosphere, becoming unduly charged with moisture, offers itself on the slightest provocation to the formation of clouds, and in nine cases out of ten rain falls immediately condensation sets in.

Reducing Weight.

A young English girl afflicted with an undesirable amount of adipose tissue has succeeded in ridding herself of a large amount of it, without injuring her health by following the regime given below. She began by getting up at six o'clock every morning and taking a three-mile walk before breakfast, without considering the weather. At nine o'clock she had a large cup of coffee, with very little sugar and a slice of dry bread. Then she occupied herself as she liked until two o'clock, when more bread and some vegetables composed her meal. At 4:30 she was off for another long walk, followed by a cup of tea and a few dry bnscuits. Ninety days of this regime reduced her weight from 185 to 145 pounds.

A Penny.

A penny is the most ancient of English coins, says a London paper. The word was originally used for money in general. It is first mentioned in the laws of Ina, King of the West Saxons, about the close of the seventh century, and was of silver deeply indented with a cross so as to be easily broken lnto two or four parts. It is the radical denomination from which English coin is num-

bered, weighing 22½ grains troy, being the 240th part of a pound.

It is stated that Ethelbert, King of Kent, coined pennies between 500 and 616 A. D. Edward I coined pennies. In 1797 copper pennies were used, and bronze ones in 1860, valued at half the copper ones. The United States coined copper cents and half-cents in 1793, in 1857 a nickel cent, and in 1865 a bronze cent. The word penny is derived from the old German word pfant, a pledge. It was the only coin current among the Anglo-Saxons. After Edward III the coin decreased in value. To the lowest coin Robert Morris gave the name of "cent" because it was the hundredth part of a dollar. Its first coinage was in 1793.

Keeping Moths Out of Woolens.

There is one sure preventive of moths, and one which I have never seen mentioned. It is tansy, says a writer in *Good Housekeeping*. Sprinkle the leaves freely about your woolens and furs—the moths will never get into them. When I was a child my grandmother used to send me to the tansy patch on the hill, with a large basket in which to bring home plenty of tansy leaves. In the garret were five large hair-covered trunks, studded with brass nails, filled with her best blankets, coverlets, flannel sheets, etc. Some of them had never been used until my grandmother had grandchildren, notwithstanding she always had a large family to provide beds for. But the supply of her bedding, linen and other household articles were in excess of the demand. This large amount of bedding, tablecloths, towels and linen sheets were spun and woven in her father's house, and the girls were given full liberty to take all they were willing to make up for themselves. That was a part of their marriage dower. I can well remember how grandmother took the extra supply out of those trunks in the garret once a year, hung the articles on the clothesline down in the orchard, beat them, and then put them away again to lie amid the tansy leaves until another year. The fourth generation of her posterity are sleeping under those same blankets and blue and white coverlets now, which proves the efficacy of that remedy of the olden time.

Whether a water-wheel runs faster at night than in the day is a problem over which scientific readers of a German paper have been puzzling. The leading opinion is that the wheel does run faster at night, for the reason that the water is then cooler and somewhat more dense than when warmed by the sun.

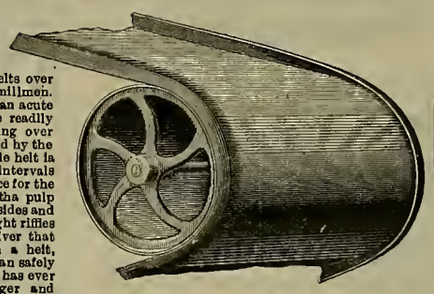
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

$1000 WORTH OF LAW
FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

Address THE DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.

H. S. SPAULDING, Publisher.

PRACTICAL TREATISE ON HYDRAULIC MINING.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Coast Industrial Notes.

—The electric lights of Healdsburg will shortly be in use.

—Pasadena has a hotel recently completed at a cost of $215,000.

—The streets of Santa Monica are now lighted by electric lights.

—The State capitol at Sacramento has been cleaned and repainted inside and out.

—Grape shipments from Sonoma county to the Eastern market this year netted $70 a ton.

—Spokane, Wash., has 236 electric arc lights at present, for which the city pays $8 per month each.

—Palo Alto, the university town, has filed a petition with the Santa Clara supervisors for incorporation.

—Many of the sealers at Victoria are receiving new sails, but no crews will be signed until the results of the London fur sales are known.

—An inventor of Gila county, A. T., claims to have perfected a device which will automatically elevate water from a well of any depth.

—Street car lines of Butte, Mont., will hereafter charge 10 cents for a ride to those not having tickets. The tickets are sold for five cents each.

—The Stoney creek bridge in Selkirk, B. C., the highest trestle in the world, has been replaced by a steel suspension bridge. The creek is 295 feet below the rails.

—The Cascade division of the Northern Pacific has been consolidated with the Pacific division with headquarters at Tacoma, Wash. This makes over 500 miles of road in one division.

—The execution directing the sale of the Oregon Pacific Railroad was placed in the hands of the sheriff last week. The date is fixed for Friday, December 15th. The deposit of $200,000 cash or certified checks in the required sum is to be applied on the purchase when the sale is confirmed.

—The recently consolidated street-car corporation, the Market-street Railway Co., has put into operation a system of transferring between the cable cars of the former Omnibus Co. and the cable cars on Market street. Transfers are also arranged between the Folsom-street or North Beach & Mission Railway cars and the Sixth-street or Central railway line.

—The Simpson Lumber Co. (a corporation) has caused attachments to be issued against 11 pieces of real property and the lumber yard on Fremont and Bryant streets, belonging to the Swift Lumber and Improvement Co., also a corporation. The attachments were issued in order to secure a series of claims aggregating $22,686.95, for which suit in recovery has been commenced in the Superior Court.

—The British steamer Bawnmore, Capt. Woodside, has been chartered by Grace & Co. to ply between this port and Playta, Peru, for the purpose of bringing petroleum here. Iron oil-tanks and pumps will be put in position. This is the first time that oil has been shipped here from Peru in any quantity. The Bawnmore has a carrying capacity of 3000 tons and is expected to make the round trip every two months.

—The basis of the Southern Pacific Company's new local freight tariff has been established, and the tariff, so far as completed, has been approved and accepted by the State Board of Railroad Commissioners. The new tariff will go into effect on the 1st of next January. It is estimated that it will result in a net reduction of 10.81 per cent. The new schedule will make a book of 1100 pages, about the size of Webster's dictionary.

—Work has been begun in this city on the electric street railway on lower Broadway. This line is to run from the intersection of Mason street and Broadway to the ferry. It is being constructed by the consolidated Market Street Railway Co. and will be part of what has hitherto been known as the Powell-street line. For two blocks it will use the rails of the North Beach & Mission road and will accept transfers from that line, as well as from the Powell-street cars.

—Fire at Healdsburg, Sonoma county, November 2d, occasioned the following losses: John McDonough, Sotyome Hotel, damaged and loss $10,000, insured for $8342; F. A. Haas, dry goods, $1700, insured for $5000; J. F. Grater, two buildings, $3000, insured for $1000; Grabner & Urhan, bakery; $1200, insured for $600; S. J. Ham, saddlery and barness, $1000; L. O. Walh, saloon, $1100, no insurance; Sam Meyer, general store, $500, insured; A. Thuman, jewelry, $200, insured; F. Steinback, harber, $125, insured; I. Novinsky & Co., general store, $200, no insurance; F. Koenig, $500, insured; Cummings Brothers, livery, $100, insured; G. Kunz, variety store, $125, insured.

—The State of Washington University regents have decided to advertise for plans and designs for the main building of the new university on the Lake Washington site, to be presented not later than Feb. 17, 1894, as provided by the law passed at the last session of the legislature. This law provides for premiums for the three best plans and designs, the first prize to consist of the acceptance of the plans offered and the appointment of the winner as architect of the building, the second to consist of $1000 and the third of $500. The law provides for the erection, first, of the main building, which is to be capable of enlargement, and then for other buildings for the use of the professors, students and employes.

—An important contract has been filed in the San Bernardino County Recorder's office in which the Semi-Tropical Land and Water Co. undertakes to furnish the Rialto Irrigation District with 301½ inches of water from what is known as the Meek's Mill property and 348½ inches from the Lord place; also to construct pipe lines and lateral pipe lines for the distribution of water over an extensive area of the orange belt in and around the town of Rialto. In consideration of the water and pipe lines the Irrigation district turns over $500,000 in irrigation district bonds, which have been deposited with W. S. Hooper, cashier of the San Bernardino National Bank, as trustee for both parties.

—Judge Stallcup of the Tacoma, Wash., Superior Court has appointed Josbua Pierce receiver for the Fidalgo and Anacortes Railway Company, upon the application of F. L. Blatner, a creditor of the concern. The application states that an execution has failed to discover any assets that can be levied upon, all the land being held under mortgage by the California Safe Deposit and Trust Company as security for its guarantee of $100,000 worth of bonds issued by the railway company. The personal property, consisting of steel rails, the electrical equipment and machinery, is alleged to be held under lien by several manufacturing companies. Several years ago the company built an electric road between Anacortes and Fidalgo bay, on Fidalgo island, the distance being about nine miles. The line has never been operated.

—The Consolidated Piedmont Cable Company of Oakland is in the hands of a receiver. The direct cause of the attachment and the subsequent appointment of a receiver is the fact that on November 1st $30,000 was due as the semi-annual payment on $1,000,000 worth of the first mortgage bonds of the company. The corporation defaulted on the interest payment, and the result was the application for the appointment of a receiver by the trust company as the representative of the bondholders. The Consolidated Piedmont Cable Company was organized and filed articles of incorporation April 19, 1890. The capital stock was $2,000,000, and the incorporators were Phebe A. Blair, E. A. Heron, Wilson R. Morse, Oakland; Montgomery Howe, Samuel Howe, Alameda County; Daniel Meyer, Ira Bishop, San Francisco. The paid-up capital stock was $17,500, of which each incorporator subscribed $2500.

—The passenger department of the Southern Pacific has issued a Midwinter Fair circular of information for intending visitors, calling attention to special rates which have been made to San Francisco and return during the Midwinter Exposition, from Portland, Or., Ogden, Utah, and El Paso, Texas, including intermediate stations, and stations on local lines of the Southern Pacific Company, Pacific system. These rates are as follows:

Class A.—Half fare or one-way rate for round trip, with $2.50 added, from all stations located over 300 miles from San Francisco.

Class B.—One and one-fifth fare for round trip, with $2 added, from all stations located over 150 miles (not to exceed 300 miles from San Francisco).

Class C.—One and one-third fare for round trip, with $1.50 added, from all stations located within 150 miles from San Francisco.

The minimum special rate will be $1.

Entrance ticket coupons to the fair grounds will be sold with the railroad special tickets as follows: For Class A, five gate coupons; for Class B, four gate coupons; for Class C, three gate coupons.

The return portions of these special tickets will be limited to stay in San Francisco as follows: Class A, over 300 miles, ten days; Class B, over 150 miles, seven days; Class C, less than 150 miles, five days.

These special tickets will be limited to continuous trip (*i. e.*, without stop-over privileges), both going to and returning from San Francisco. In addition to the above individual special rates, chartered cars can be secured under company's rules and regulations.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MACHINERY BOUGHT.—*Record*, Oct. 26: Dr. Boydson, who is operating the Pioneer mine at Plymouth, has purchased the hoisting and mill plant from the Empire company at that place and will erect the same on his mine.

James Burdon and others are sinking for gravel a mile west of Plymouth.

The Irma mine, in the Pioneer district, has closed down temporarily. Things were not in very desirable shape to carry on operations through the winter months, and consequently it was deemed best by the company to suspend work until February.

Last Friday 34 liens were filed on the Clinton mine and property. The total amount involved is about $3000. Silas Penry is attorney for the claimants. There is but little doubt that these claims and all other indebtedness will be paid off in a short time and then work will be resumed at the mine on a more substantial basis than heretofore.

Voorheis & Barney are repairing their chlorination works in Drytown and expect to be ready to start up next month.

At the Gover mine a new ledge was struck on the 800-level last week, lying between the old ledge and the footwall. The new find is five feet in thickness and the rock is rich, being of a ribbon character and showing plenty of free gold and sulphurets. It is looked upon as a very important development. The damaged shaft is nearly repaired. New morter blocks are being put in the mill—in fact a general repairing is going on in both mine and mill. It is expected to resume crushing about the 1st.

At the Wildman mine they are making excellent headway in sinking, having gone 20 feet last week. It is expected to sink 200 feet, or to the 1300-level, before stoping is begun. The pumps and everything about the mine are working smoothly, which accounts for the rapid progress being made.

At the South Eureka mine the contractors are driving ahead the drifts on the lower level.

Kern.

RICH PLACER STRIKES. — *Chronicle*, Nov. 7: Kern county's mining boom still continues. I. N. Chapman, at one time a United States surveyor, is now in town preparing for a return to the diggings. These are on the desert side of the Sierra Nevada mountains, about 30 miles north from Mojave. Mr. Chapman reports that the mines are very rich and that a great deal of coarse gold is being obtained. The country is waterless. Even the drinking water has to be brought to the miners in barrels. In consequence the gold is all "washed" dry. The gravel is shoveled into a machine like an ordinary grain-fanner. This is usually worked by hand. The gravel passes through several sieves of different sizes and the dust is blown away, only the gold falling to the bottom.

The mines are in the same township as the town of Kane's Springs. Most of the miners are working in the gravel beds in Goler creek and Jawbone canyon. It was in the former that J. S. Reed found a 56½-ounce nugget a short time ago. This single lump of gold is worth over $1000.

The pay gravel is not only in the canyons and creek beds, but all along the base of a high mountain range which occupies the western part of the township. It is from the rich quartz ledges in the high range that the gold comes. While the country is without rain there are sometimes cloudbursts. These carry whole hillsides down into the valley. In this way the gold was washed into the gullies. There are now 600 men at the mines.

Mariposa.

THE HITE TO REOPEN.—Mariposa *Gazette*: Mr. Bert Morgan is here representing the McCaw Company, who have obtained possession of the Hite mine. Mr. Morgan has engaged several men for a while until he can ascertain just what is needed in and about the Cove, but within a month he will have a large force at work on the road and about the mine. The McCaw brothers are shrewd business men and practical miners, and own and work one of the largest quicksilver mines in the State—the famous Cinnabar mine in Trinity county.

Mono.

TO TEST ORE.—Bodie *Miner*: The men employed at the Summit were drafted this week. A test run of ore is now being made at the Bodie mill, and if the result shows that the ore can be worked profitably the men will be returned to work. There is undoubtedly quite an ore body in the Summit, and if it can be made to yield paying returns it will prove a help to the camp.

Nevada.

NEW DISCOVERY OF GOLD.—*Telegraph*: Gold has been discovered in the Crown Point mine, owned by Mr. A. Ganthier of this city. The discovery was made to-day by John T. Polkinghorn and James Yonlton, two experienced and practical miners. The ledge is about 60 feet northeast of the main ledge, three feet thick, showing free gold, sulphurets and galena.

Mr. Polkinghorn first discovered the apex of this vein over 40 years ago, in the spring of 1853, while working on a gravel diggings on Wolf creek. At that time there was but little attention paid to quartz mining and Mr. P., like many other miners, passed it by carelessly. While living in the East he frequently thought of this fine prospect and determined he would embrace the first opportunity of developing this ledge. Finally he formed a partnership with Mr. Yontlon, and they entered into a contract with Mr. Ganthier to make the discovery and they succeeded in finding it in three days.

Work will be commenced immediately, pumping out the water of the main shaft down below the 200-foot level and then crosscut into the ledge.

TO BE STARTED.—*Transcript*: Albert D. Allan, owner of the well-known California mine, upon which little work has been done for many years, has decided to start it up. He will commence immediately in erecting new hoisting works and will crowd developments in the mine.

BODORT & MILL.—*Transcript*: Fred Zeitler, superintendent of the Champion mine at Nevada City, and a large stockholder in the St. Gothard quartz mine at Columbia Hill district, says that the latter company have purchased the mill of the Delhi quartz mine and will remove it to the St. Gothard immediately. As soon as it is put in place a large number of men will be employed and the mine worked on an extensive scale. It is believed that the mine, when thoroughly opened, will be equal to any one ever worked on that ridge.

THE HUDSON BAY.—*Telegraph*: The recent development in the 150-foot level of the Hudson Bay mine has been of sufficient importance to warrant the company again sinking their main shaft. The recent development in the Rocky Bar ground by the tribuners now proves beyond a doubt that there are two parallel ledges running through the Hudson Bay; its new shaft has been sunk 160 feet deep, and 25 feet deeper will strike the first ledge, a fraction deeper of 10 feet will encounter the second ledge, while it is undoubtedly the north end of the celebrated Ford & Mullen ledge that produced so fabulously in early days. All the mines on the North Star or French Lead will before long be in active operation, and the ledge of the Hudson Bay cannot be more desirable. Before long both ledges will be cut by the shaft, and great developments are expected.

Placer.

MINE SOLD.—*Sentinel*: The Moody Bros., at Gold Run, have sold their mine, the Gold Ring, to an Oakland company, of which Thos. F. Graher is the head, for $12,000. The sale was negotiated by Bert Moody and James Gayety. The Gold Ring is a good gravel mine and $15,000 has already been taken out by the former owners. The gravel worked by them was a soft stratum, but underneath this is a blue cement gravel which they were unable to work on account of not having a mill. The *Sentinel* says the new owners will put up a stamp-mill immediately and work this cement, which prospects very well.

John Spaulding has about 15 men at work building the dam at Dutch Flat for the working of the Polar Star mine, if the Debris Commission accepts the work.

George Woods, who has charge of the Foss mine at Lowell Hill, is pushing the prospecting work and is preparing the mine for drifting in the spring.

Sacramento.

A $30,000 CLEAN-UP.—The Folsom *Telegraph* tells how D. W. Burnett, near Salmon Falls, lost a fortune by leasing a piece of his farm on the American river to Chinese for $150, which he considered so much clear gain. The riverbed at that point had never been worked, and the wily Chinamen knew better its value than did the "old-timers." They cleaned up fully $30,000.

Sierra.

A LONG TUNNEL.—Pinmas *National-Bulletin*: Horace Taher of Gibsonville spent a couple of days in Quincy last week—Thursday and Friday. Mr. Taher has a force of men employed in driving a tunnel into the Gibsonville ridge to tap the big gravel channel there. During many years past, he has labored to accomplish this result. The tunnel is now in over 2500 feet, and it is expected to break into the gravel channel any time. The month of the tunnel is just below Gibsonville on the La Porte road, and from no other point could the ancient and rich channel of Gibsonville ridge be tapped at so short a distance. Mr. Taher's claims are situated just above those of the Thistle Shaft Company, which are understood to be producing large quantities of gold, though at considerable expense for hoisting, etc. Through the tunnel which Mr. Taher is now running, not only can his own claims be worked (and they embrace one mile of the ridge), but the tunnel is the key to that part of the channel lying above his claims. The moment Mr. Taher taps the channel, he will have one of the largest and best mining propositions in northern California.

Siskiyou.

GOOD RESULT.—Scott Valley *News*, Nov. 4: Tailings from an old arrastra were worked by the Crawford mill owned by A. G. Myers, and yielded about $4 a ton. This shows a great saving in handling the ore by the new process, and is a matter worthy of the consideration of miners who desire to obtain the best results.

MINING NOTES.—*Journal*, Nov. 1: Boyle & Co. are taking out rich quartz lately from their ledge at the head of the North Fork of Humbug, and are also engaged in running a tunnel to strike the Spencer ledge some distance below on the same fork.

White & Co. have struck a fine two-foot ledge on main Humbug creek, about a quarter of a mile below the forks, and feel confident of realizing good pay.

Burgess & Co. will soon commence opening a rich ledge on Pinch creek in Humbug district, which is considered one of the best ledges in that section. They contemplate putting in an overshot wheel for hoisting to better advantage than by hand power. The sulphurets found in this claim are exceedingly rich, and a good method of separating the gold therefrom is another matter requiring scientific attention.

At the Greenborn blue-gravel mine, near

Yreka, the cool nights allow more water lately for washiug purposes, and the claim is constantly paying better. Jnst as soon as rains commence, the force at work can be donbled toward realizing better proportionate resnlts. With an abundance of water, three shifts can be employed in the place of two as at present, in order to utilize every minute of the 24 hours of each day, in place of 20 as at present.

H. B. Van Vactor, the solid and eubstantial miniug man of tbe firm of Van Vactor & Staples, was in from the Siskiyons last week. They made a partial clean-up iu their ten-stamp mill now in active operation at Hungry creek, the contents from the plates and concentrator working $10 per ton. The ore they are now running on shows np handsomely on the plates, and is expected to work $20 per ton. The expense of mining and milling now costs them only $1.75, and they will soon have it so reduced that it will cost bnt $1 per tou for mining and milliug. Mr. Van Vactor says their Sterling ledge is an eight to ten footer; their Coyle ledge is also wide, and there is no doubt they have one of the finest miuing propertiea in the country. W. H. Mowat, Fred Denny and J. L. Coyle have a promising ledge in the same vicinity, that Mr. Van Vactor says looks like a fine prospect from the work done.

James E. Smith's quartz mill is ready to commence work this week on the mine he bonght of Pearsou & Crowson near Hornbrook.

Ventura.

PIRU MINING DISTRICT.—TO THE EUITOR:—The mining outlook in this district is improving and mining men are beginning to pay some attention to our mineral wealth. Several parties have been looking over this mineral belt. There also have been several placer claims located in this district in the last few weeks. Mr. Fowler, on the San Gillmo creek, bae located eeveral for himself and others. He is goiug to put in a hydraulic plant, so he informs the writer. He also etates that he hae made from $1 up to two ounces per day with a very small eluice-head of water. An old man and his son, two miles south of the Frazier mine, are working in a small dry gulch aud are taking out eome very good gold nuggets worth from 50 cents to $12 They have no water, but do their dry-washing with a pan. There is no doubt bnt that there is much good placer gronnd in thie district. I have cleaned up two ounces in a day's work on Rattlesuake gulch, one mile below the White Mule mine. Of couree, that was an exception, but it shows that there ie placer gold iu paying qnautities here. The great drawback is water; it is very scarce in most of the places that prospect the best.

Mr. Robb is still working on his mica miue, aud I am informed that the mica improves in quantity and qnality as depth is attained.

The Frazier Miuing Compauy have put meu to work on their mine again. I think that all the miue lacks to make it a good paying property is a thorough, practical aud experienced mining and mill man.

Mr. S. Beach has been working the Beach & Colldiott mine, situated a short distance north of the Frazier mine. He has bought ont two of his partners and now hae control of the miue. He has ruu several tons through au arrastra and the ore paid very well. He will put in a mill next spring, if nothing happens.

John Foley has been running ore from the Irish Republic throngh a one-horse arrastra and it paid $100 per ton in gold. The vein is five feet wide, but the richest ore is in the center of the lode and is about one foot in width.

D. M. Menzies has purchased the half interest owned by Wm. Meuzies in the Brown mine. D. M. saye that the Brown is showing up finely, there being plenty of ore wbich will go $12 and over per ton.

George Haylock has struck the Bunker Hill lode at 80 feet below the upper workiugs, some of the quartz showing gold to the naked eye. It is the intentiou to put up a mill on the claim, or near it, early next spring. The vein is 80 feet wide on the snrface, but how wide it is 80 feet below is not knowu yet, as Mr. Haylock has not cnt across it yet.

The White Mule mine has been shut down eince last spring, and Mr. J. P. Bergeron has purchased a three-fourths interest in it. He had a chemist come up to try the ore by the cyauide process aud it proved excellent, only one-tenth per cent being required to extract 98 per cent of the gold. The chemist's name is Cbarles Metcalfe, a man of many years' experience in the working of metale, and also in the sampling, buying and selling of all kiuds of ores. He is acquainted with Almarin B. Paul, from whom he got eeveral good ideas about the cyanide process.

J. P. Bergerou is in a big coal discovery out near Gober district, northeast of Mohave station on the Southeru Pacific railroad. The writer has prospected from Siskiyon to San Diego, has been in Califoruia siuce 1863, and has heard of hundreds of big coal strikes in the State in that length of time, but no good coal has ever been found. I have no faith iu that any will be found in southern California.

Ventura, October 28, 1893. I. H.

Yuba.

STARTED UP.—*Democrat*: The Excelsior Water and Mining Company have reenmed hydraulic mining under the provisione of the Caminetti law, and every one in that section ie jubilant over the outlook for Smartsville and vicinity. The company have complied with all the requiremente of the law. The workings of the mine are open to the inspection of all, and eepecially are the valley folks invited to come to Smartsville and view the plan that impounds the tailings of the Blue Gravel mine.

NEVADA.

Eureka District.

DOC HARRIE' STRIKE.—Eureka *Sentinel*: Doc Harris has a lease on the Friday, one of the miues of the Hamburg series, and is doiug first-rate. He says he is making four shipmeuts of ore per month, a shipment consisting of 15 tons. The ore averages about $40 in gold and two or three ounces in silver per ton. Doc says where he commenced work, previons to striking this ore body, there were no more indications of ore to be seen than are to be observed in the monntains east of Eureka. Had the tunnel that ran into the body of ore been driven four feet higher or the same distance lower down the monntain he would have missed the bonanza that is rewarding him so handsomely now. He also says the iron which the ore contains pays for its working.

Kennedy District.

JENKINS' MILL.—J. R. Benton, who is in from Kennedy, informe the *Silver State* that work on Jenkins' mill is progressing rapidly, and it is expected that it will be ready to start up by December 1st. All the mines in the district are looking well, and if the mill works the ore successfully Kennedy will soon be a lively camp. There are now about 80 men in the dietrict. There is a weekly mail service from Winnemncca, and an effort is being made to have it increased to tri-weekly.

THE GRIZZLY RIDGE.—*Transcript*: The owners of the Grizzly Ridge mine, near Columbia Hill, will shortly begin work upon the property on a more extensive scale than ever before. This mine was formerly owned by P. McAnsland aud others, but has been sold to a San Francisco compauy. Fred Zeitler, superintendent of the Champion, is one of the principal stockholders. Some of the other owners have recently visited the mine and feel highly pleased at the outlook.

Some remarkably rich ore has been taken out of this mine at different times, and there is a good ledge of ore in the tnnnel from which rock enough can be takeu to keep a mill going steadily. It is the intention of the present company to put up a mill and other machinery right away.

Mardis District.

GOOU PEOSPECTS.—Elko *Free Press*: Mardi, district is coming to the front at a lively rate and next spring will nndonbtedly witness quite a little settlement there.

Hall & Hamill are putting up a gold-quartz mill on Copper creek and constructing a big ditch to take water from the head of Copper creek, with which to run the mill. Their quartz lead is developing well, and prospecte are good. Joe Hall has purchased the Dorsey hay ranch on the river, and is erecting a dwelling honse for himself and family.

McCullongh and McLaughlin, who own the Union Gulch placers, have bouded their claims to Denver parties, who are bringing in a large ditch from Copper and 76 creeks to the diggings. They have laid out a townsite on Union Gulch, aud are doing considerable other preparatory work. They evidently mean busiuess, and will have a good-sized camp there in the near futnre.

ARIZONA.

THE SILVER KING.—*Citizen*: The Silver King mine of Pinal county, in its time one of the greatest silver properties in the world, is now probably abandoned. Former miners of the property know where good veius are yet uutouched, but geuerally they are impracticable to reach. Often they are behind waste stored in unnsed chambers instead of beiug taken to the snrface and thrown out on the dnmp.

The King mine made several men rich and kept a large force employed for years. The mine was practically all developed with its own contente, no outside capital going into it.

In the great hollow depths of the mine, where one may wander for hours, is a whole forest of timber. A former miner estimates that a million dollars' worth of timber is buried in the Silver King. It is hardly worth the removal, however. The same ie the case with the engines. Their removal would almost offset their value.

Of all the men connected with the mine, one, or two at most, are wealthy to-day. It is even said that uone of them are "worth anything" to-day, financially speaking.

PLENTY OF GOLD.—Tombstone *Epitaph*: E. W. Storrs is in from Miller canyon, where he and his partner, Wickersham, are workiug a gold property. This particular mine was owned by the latter for 12 years but no work of a remunerative nature has been done on it until this year. A carload of ore which will run 50 per cent lead and $50 in gold beside 10 ounces in silver is on the dump and will be shipped this week. The ledge can be traced for miles and is strong and well defined. Four miles from this mine is the group being worked by Lusk & Connor. The latter has been over to the Superstition mountains near Phenix but has returned home convinced that he has the making of a bigger mine on the summit of the Huachuca mountains and work will be pushed again. The gold mines of the Hnachuca mountains are attracting much attention at the present time.

A FINE OF MARBLE.—Phœuix *Republican*: A discovery has been made near the Verde, about 75 miles northeast of the city, which will prove much more valuable than the average gold mine. It is an almost limitless deposit of marble of a high grade. Samples have been submitted to experte, who pronounce it euperior to the beet Vermont marble. The eamples are snsceptible of a high polish, which is taken easily.

BRITISH COLUMBIA.

THE OKANOOAN FIELDS.—Spokane *Review*, Oct. 25: "A mill rnn of eight tons of ore from the Triune mine was made a short time ago," eaid Mr. Del Hart, merchant, of Golden. "The result was the best ever obtained. It was ouly intended as a small grub enterprise, and two meu did all the work, mining the ore and milling it in three days. It netted them $160, or $20 to the ton. I have more faith iu Okanogan than any other mining region in the Northwest. Rest assured that Palmer mountain will make its mark not later than next spring. All that has ever been required was capital, intelligently employed, and the mines are so far advanced with this year'e development as to insure no further delay on that account.

The assessment work has been completed on 12 claims at the Spokane, indicating that the owners of that property have unlimited faith in its value, althongh operations were considerably retarded by the suspeusiou of banks in Spokane when the financial crash occnrred.

Work has been temporarily snspended at the Grand Summit, owing to a misunderstanding among the parties interested. Mr. Enright made some sort of conditional sale of his interest to his partners, and a dispute arose as to the particnlar part of the property to be worked and the method of doing so. Owing to the lateness of the season, there will probably be little more work done there until next spring.

"The season ie closing," Mr. Hart says, "with a better showing than ever before, and at no time in the history of the Okanogan camps have the people exhibited such cheerfulness and confidence."

The weather continues fiue and many prospectors are etill at work in the hills. So far ae heard from, their expectations have been very generally borne out by the summer's operations, and extraordinary efforts will be exerted in the way of development on a larger scale next season. Few are anxious to sell, yet there will be opportunities for capitalists who know a good gold property when they see it to obtain interests on very reasonable terms, as the miners realize the benefit of enlisting men of meaus to more rapidly and systematically open the mines and begin production.

OREGON.

AT THE GOLDEN EAGLE.—Ashland *Tidings*, Nov. 3: The latest mining sensation in local circles is the rich strike made iu the "Golden Eagle mine on Williams creek, owned principally by Ashland people. R. M. Garrett and Jack Garvin, part owners of the mine, who had been there for a week or two, returned last Saturday with some ore that lifted the eyes out of the sockets of the beholders. They had a sack of ore weighing about nineteen ponnds. They had already waehed out of it without crushing a bunch of nuggets worth abont $150. The rock wae mortared in Ashland and yielded another hundred dollars. The tailings also carried plenty of fiue gold which they had to catch by amalgamation. The ore was taken from a 30-foot prospect shaft iu a ledge abont three feet wide. It was located last spring by Robert Neal of Wagner creek and Fred Mallen, and has been sold by them to a company composed of Jack Garvin, R. M. Garrett, Jndge Tolman, Crit Tolman, R. Beswick, J. H. Martin, Capt. Ingalle of Portland, and Dr. Van Hasslocher of Paris. It is located on Williams creek, within half a mile of the "Bone of Contention" mine owned by Smith & Booth of Grante Pass, upon which there is a stamp mill. The company have three ledges, one larger and another smaller than the Golden Eagle, and all lying parallel. The claims are on a ridge cnt by the gulches from which hundreds of thousande of dollars were taken years ago in the rich Williamsburg diggiugs, and the men who have made this strike of rich ore think they have lots of it within their claims. They will make arrangemente soou to work the mine through the winter.

The Ashland mine, the foundation of all the mining activity about Ashlaud, continues to tnrn out its regular monthly divideuds.

Geo. F. Gund, the Seattle member of the firm of Guud & Edwards, arrived in Ashland laet Friday, accompanied by Geo. T. Milliken, the expert who was here last snmmer. In company with Mr. Edwards they have pnt in the present week examiniug the Hope mine and other properties in which Gnnd and Edwards are interested.

Snowgoose Brothers, who came in from Klamath county late in the summer, and one of the Wertz boys have several quartz claims in the Siskiyous, near the railroad, which show good prospects. They are fixed with bnildings, etc., for winter weather, and intend to keep right at work, regardless of wiud, rain or snow.

J. W. Briner is still at work prospecting his cinnabar claims up near the head of Applegate, and from samples of ore which he took over to Philip Mullen last week to test he is satisfied that he has one of the best cinnabar prospects unearthed in this region.

J. F. Dnffy has struck a very promising lead of cinnabar in the prospect tunnel which he is running on the claims near the McCall & Anderson mine, and is uow drifting along the vein and taking out some ten per cent cinnabar ore.

THE ILLINOIS PLACER COMPANY.—*Oregonian*: Among the recent arrivals in Captain George A. Pease, who has just been looking after his interests in the Althouse district. He reports that the most promising placer prospect there is owned by the Illinois Hydraulic Mining Company. It is situated about 60 miles eouth west of Grant's Pass, in Josephine county, and is in the heart of the Siskiyou mountaine. About 30 years ago it was worked by a couple of Germans. After several good finds they came upon a piece of quartz which netted them about $1200, and satisfied with their haul they left the country. The big hole which they dng in the mountain side was partly filled by a mountain elide, and it was in that condition when H. L. Doney and Dr. J. M. Taylor, while on a prospecting tour, found the claim abont July 1 last. They waehed out eome rich dirt, and picked up several good-eized nuggets before leaving the place. Eight claims, covering about 160 acres, were etaked out on the property, aud a compauy formed to work it. An abundance of water can be obtained from Boulder and McDonald creeks through pipe lines about 600 feet in length, bnt reservoirs mnst be bnilt to keep up the snpply all the year round. While digging a ditch the workmen picked up $600 worth of small nnggets, and again, while eluicing out a portion of the old tunnel, 20 feet in length and 4 in width, 20 ounces of small nuggets and coarse dnst were picked up. There are now en ronte for the miue a hydraulic "giant," some smaller machines and a large amount of piping, all of which, it is expected, will be in place before the snow falls. No attempt has yet been made to estimate the value of the dirt, for the owners of the mine believe they have eometbing better on hand than the placer mine. About 350 feet up the mountain side they have discovered a well-defined ledge from which, they believe, the gold in the placer below has been washed. It is the intention to sluice out all the debris below this ledge, laying the rock bare, before working on the ledge itself.

MINING NOTES.—Jacksonvile *Times*, Nov. 3: Since the arrival of the Huntington mill at the Golden Fleece mine near Ashland, attention has been attracted to that locality and several pieces of land near have been bonded.

Lon. Edwards has his men at work at the Hope mine, which was bouded a short time ago by Gund & Edwards. They are cleaning out the old prospect shaft at a point near the dividing line of the "Hope" and "Shorty" claims. The shaft was filled np with waste by the men who worked the mine last. After it is cleaned out and retimbered it will be eunk deeper npon the ledge, in prospect work.

Phil. Miller, who is superintending operations at the Miller mines ou Farmers' flat is making preparations for the next season's run.

John Simons left Tuesday morning to commence operations on the Bailey mine ou Missouri flat, which has been bonght by a Portland syndicate.

Drew & Co. are about to put up a five-stamp mill on the quartz ledge which they recently pnrchased from G. R. Hammersley in Jump-off-Joe district.

Jos. Wolfstein aud J. Weill have located 40 acres of mining ground near the Oregon line and have acquired water rights on Dutch creek, a tributary of Elliott creek.

Messrs. Poppleton & Bishop, the gentlemen owning the dry-wash machine which was given a successful trial at Al. Sturgis' claim this week, have bonded the Owen's claim in Jackson creek district and will put a force of men to work on the mine as soon as possible. The machine ie evidently a snccess and will make it possible to work many claime in this section, which have not paid before on account of lack of water.

GOOU PICK-UP.—Baker City *Democrat*: A couple of prospectors at tbe First Natioual Bank have exchanged fonr and a quarter ounces of virgin gold for three shining twenties and eight "cart wheel" dollars. They informed the cashier that the amonnt was realized from several pieces of float picked up about six miles east of the city which was pounded out in a small hand mortar, the work ouly requiring abont au hour.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreigu Patent Agency, the following are worthy of special mention:

SLOT BRAKE FOR CONDUIT RAILWAYE.—No. 507,366. Dated Oct. 24, 1893. Wm. M. Hood, of San Francisco, Cal., assignor to the Pacific Cable Railway Company, same place. This device consists of a laterally expansible and contractible brake shoe or piece, traveling in the slot of the conduit, and adapted by its expansion to form frictional contact therewith, and by its contraction to relieve itself. In detail the brake shoe or piece is composed of a central section and two end sections. These are moved into line to relieve the brake, and are moved in opposite directions to expand it and cause it to bear on the walls of the elot.

CAN-MAKING MACHINE.—Robert D. Hnme, Gold Beach, Oregon. No. 506,878. Dated Oct. 17, 1893. The object of this invention is to complete metal cans from the flat sheets of metal, eolder the longitudinal seams and apply the head to the finished can in a single operation. The metal sheets are delivered from a table to cutters, by which they are accurately seized, then advanced over a former after having the interlocking edges turned, the former giving the sheets a cylindrical shape, after which the edges are interlocked and closed, the seam soldered, and finally a head is placed upon the end of the can thus completed.

SHOULDER CUTTER FOR VEHICLE AXLES.—Joshua Sovereign, Woodland, Cal. No. 507,389. Dated Oct. 24, 1893. The object of this invention is to provide an apparatus for cutting shoulders npon the outer ends of vehicle axles and a means for accurately adjnsting and centering the apparatus upon the axle to be cut. It consists of a sleeve of larger diameter than the axle, and tapered correepondingly. Another eleeve ie turned to fit the interior of this larger sleeve, and the interior of the inner sleeve is tapered eo that when it is slipped into the onter sleeve the taper socket clasps and fits the end of the axle and thus accurately centers it within the outer eleeve. Set screwe paseing radially throngh the outer sleeve are turned in until they bear againet the axle and hold it central, after which the inner eleeve is removed. The cutter holder is then fitted upon the end of the sleeve, which ie fixed to the axle and ie adapted to revolve upou it. The cutter ie fitted to elide in guides upon the holder, and may thns be advanced toward the center of the axle and as far from the end as it is desired to form the new shoulder.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 9, 1893.

The trend of silver prices in New York and London during the week has been upward. So far as the cessation of silver purchases has had effect, it has knocked off less than five cents from the price in New York, and in London it might almost be said to have had no effect at all. The strong force in upholding the silver market is now said to be the Russian Government, which contemplates adding silver in large volume to its coinage.

Silver and the Metals.

NEW YORK, Nov. 9.—Following are the closing prices for the week:

	Silver in London.	N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, Nov. 9, 1893.

The past week has been exceedingly active in the mining share market. The brokers report that the volume of business has heavily increased, and the record of transactions amply hears out their statements. Last Saturday was almost a red-letter day, no little excitement being created. Advances were very sharp. Compared with the previous day, on the San Francisco Stock Exchange, the advances were: California advanced 70c; Best & Belcher 40c; Nevada and Ophir each 35c; Challenge 25c; Mexican, Confidence and Jacket each 20c; Union, Curry, Norcross and Potosi each 15c; Savage, Chollar, Crown Point and Belcher each 10c; Alpha and Overmao each 5c.

The record of sales for the week was:

October 30, shares	12,230
October 31	18,670
November 1	14,415
November 2	15,845
November 3	22,180
November 4	18,750
Total	102,090
Previous week	95,190
Week ending Nov. 5, 1892	77,690

The activity in the market has continued during the present week. Besides Consolidated California and Virginia and the other leading north-end stocks, Yellow Jacket and some of the other Gold Hill stocks have been in brisk demand at a sharp advance. It has been reported for several days that the Sharon-Newlands interests at Gold Hill would be given more attention.

Below is an official statement of the sums disbursed to employes of Comstock mining companies for services during the month of October:

Andes	$900 00
Hale & Norcross	2,088 00
Con. Cal. & Va.	9,697 50
Ophir	2,099 75
Mexican	2,099 75
Best & Belcher	1,854 50
Gould & Curry	1,129 00
G. & C. and B. & B. shaft	124 00
Occidental (estimated)	1,500 00
Belcher	2,017 00
Crown Point	756 00
Confidence	100 00
Challenge	100 00
Yellow Jacket	2,049 00
Justice	797 00
Savage	5,100 00
Chollar	2,287 25
Potosi	6,116 50
Sierra Nevada	811 00
Union Shaft	2,170 50
Ward Shaft and Bullion	1,063 00
Nevada Mill	2,500 00
Electric Light Co	500 00
Outside quartz mills (estimated)	7,000 00
Water Co	3,000 00
Total	$57,949 75

The payrolls continue to drop, they are $4974.50 less for October than for the previous month. This is a better showing than was made in September, however, when there was a drop of nearly fourteen thousand.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING OCT. 24, 1893.

507,405.—HYDRAULIC ENGINE—F. Bernardi, Moketumne Hill, Cal.

507,409.—LUBRICATOR—G. W. Bovd, S. F.

507,480.—VEHICLE BRAKE—C. K. Brandenburg, Bly, Or.

507,425.—HAY PRESS—F. P. Fowler, Phoenix, A. T.

507,427.—HEADER—J. Garrett, Visalia, Cal.

507,436—GAS ENGINE—Hirsch & Schilling, S. F.

507,366.—SLOT BRAKE—W. M. Hodd, S. F.

507,370.—SIDE HILL VEHICLE—C. Koenig, Sacramento, Cal.

507,231 —GATE LATCH—L. D. Latimer, Windsor, Cal.

507,156.—CONVEYER BELT—R. Niedergesaess, Seattle, Wash.

507,232.—PLOW—J. L. Pearson, Lodi, Cal.

507,327.—MOTOR—B. L. Picaro, Centralia, Wash.

507,521.—CONCRETE PIPES—E. L. Ransome, Oakland, Cal.

507,238.—WINDOW SHADE GUIDE—F. C. Schroeder, Alameda, Cal.

507,339.—AXLE CUTTER—J. Sovereign, Woodland, Cal.

507,466.—WATERPROOF SOIT—O. Van Oostrum, Portland, Or.

507,468.—STEAM ENGINE—C. White, Oakland Cal.

507,193.—TRANSPORTING FLUID—J. S. Wintermute, Tacoma, Wash.

507,397.—LUBRICATOR—S. F. Woodworth, Clipper Gap, Cal.

FOR THE WEEK ENDING OCT 31, 1893.

507,876.—COIN HOLDER—E. Berrini, Portland, Or.

507,881.—HOP CARRIAGE—Cahill & Dickinson, Salem, Or.

507,885.—PORIFYING ASPHALT—A. S. Cooper, Santa Barbara, Cal.

507,973.—TONGS—J. W. Cox, Gold Hill, Or.

507,709 —SHEET METAL PIPE—C. S. Hamlin, Los Angeles, Cal.

507,542.—BAG HOLDER—G. Hunt, Walla Walla, Wash.

507,817.—CLOCK HAND REMOVER—C. G. Ingalls, Colville, Wash.

507,834.—BRAKE—D. C. McGregor, East Oakland, Cal.

507,630.—FLY TRAP—J. S. Morton, Los Angeles, Cal.

507,921.—CHAIR—W. S. O'Brien, S. F.

507,686.—CAR COUPLING—T. C. O'Donnell, Winnemucca, Nev.

507,926 —MINING APPARATUS—E. F. Peck, Napa, Cal.

507,845.—DRESSER—S. A. Richards, Fresno, Cal.

22,362.—DESIGN FOR WATCH CHAIN—J. Jenkins, Buckley, Wash.

Glass Curtains for Beds.

In the Paris Palais Royal there is being exhibited a novelty in the utilization of glass as an article of house furnishing. It consists in the introduction of glass curtains either for windows or beds. They are made of small squares of colored glass, each square being set in a small zinc frame, but probably the frame is a superfluity which, for the purpose of cheapness, could be dispensed with.

Assessment Notices.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees held on the fourteenth day of October, 1893, an assessment (No. 72) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, Room 69, Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of December, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69 Nevada Block, Mo. 309 Montgomery street, San Francisco, California.

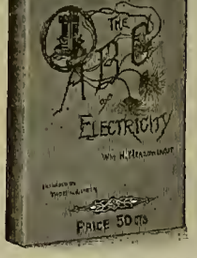
ABC OF ELECTRICITY

By WILLIAM H. MEADOWCROFT

Endorsed by THOS. A. EDISON.



WHAT THE PRESS SAYS.

"A clear and comprehensive little treatise."—*N. Y. Sun.*

"Electric Science is making magnificent strides and this book fills a useful office in setting forth the features and characters of these advances."—*Brooklyn Times.*

"The need of such a book has undoubtedly been felt by many . . . we predict for it a splendid sale."—*The Age of Steel.*

"A book like this should be largely read."—*N. Y. Herald.*

"The book is well illustrated, and no pains have been spared to make it accurate and reliable throughout."—*Electrical Review.*

"In simple language, the author lays bare the secrets of electrical science and application."—*Electrical World.*

"A vast amount of useful importance."—*Washington Post.*

FROM THE LABORATORY OF THOS. A. EDISON,
ORANGE, N. J., Sept., 24, 1888.

DEAR SIR—I have read the MS. of your "A B C of Electricity," and find that the statements you have made therein are correct. Your treatment of the subject, and arrangement of the matter, have impressed me favorably. Yours truly,

THOS. A. EDISON.

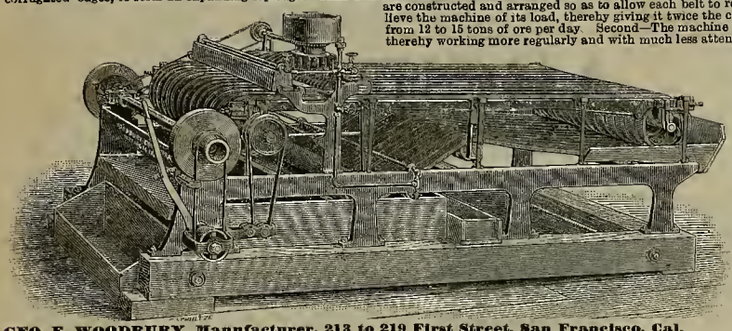
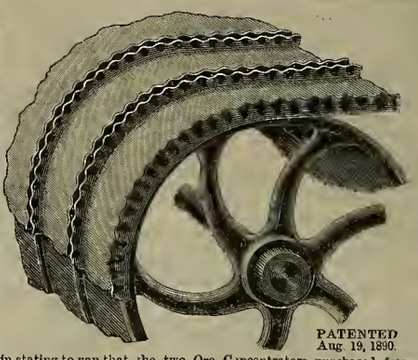
NEW YORK OFFICE, 145 BROADWAY. **Cable Address, "UNION."**

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS **Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.** MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by having several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allotted to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.



GEO. E. WOODBURY, Manufacturer, 213 to 219 First Street, San Francisco, Cal.



PATENTED Aug. 19, 1890.

[COPY.]

Eureka Tellurium Gold Mining Company, Redding, Cal., July, 21, 1893.—Mr. Geo. E. Woodbury, 213 First St., San Francisco, Cal.—Dear Sir:—We take pleasure in stating to you that the two Ore Concentrators purchased from you last April are giving perfect satisfaction. They are simple, durable and effective and we hereby conscientiously recommend the "Woodbury" pattern to all intending purchasers of Ore Concentrators. Yours truly,

[Signed] EUREKA TELLURIUM GOLD MINING CO., by GEO. C. JONES, Secretary.

VOLUME LXVII.
Number 21.

SAN FRANCISCO, SATURDAY, NOVEMBER 18, 1893.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

SEVERAL inquiries have been received by the PRESS as to whether it is perfectly safe for locators on unpatented claims to suspend the usual assessment work for 1893. There seems to be some fear that some risk may be run, and that the claims may in some way be subjected to relocation by failure to perform the usual work. There is no danger. The provisions of the law are clear. There can be no mistake. No assessment work need be done this year in any State or Territory except South Dakota. But there is one simple condition that must be fulfilled. Claimants must file a written notice with the proper authority that they intend in good faith to hold and work said claim. This matter is vital. It must not be overlooked.

THE Waukesha gravel mine at Relief Hill, in Nevada county, was sold at a Commissioners' sale a few days ago and bid in for $3600. Before the hydraulic mines were stopped this mine was valued at over $50,000.

THE Executive Committee of the State Miners Association has placed in the hands of State Senator Tirey L. Ford, W. H. C. Maxwell and August Weihe authority to confer with the California delegation in Congress relative to the bill asking for $1,030,000 to construct impounding dams for hydraulic mines. A plan of campaign will soon be decided on.

THE President has, by re-appointment, fully corrected the oversight of the Senate in its failure to confirm the California Debris Commission. Official notice of the re-appointment has, however, not yet been received, but it is expected daily. The work of the Commission will suffer very slight interruption.

IT is said that Governor Waite of Colorado has made up his mind to issue a call for a special session of the Legislature before Christmas. The continued low prize of silver and the fixed opinion of Waite that there will be a further decline to 60 cents and a consequent paralysis of the silver industry of the State are the reasons assigned for the call.

THE Cripple Creek Railroad Company and the Colorado Midland Railroad Company are having a race in railroad construction to see which will reach the gold camp in Florence, Col., first. Thousands of tons of paying ore lie dumped at Florence awaiting transportation to smelters and mills.

W. H. SHOCKLEY has resigned from the superintendency of the W. Y. O. D. mine at Grass Valley to give all his attention to other interests.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Integral Quicksilver Mines, Cinnabar District, 321.

EDITORIALS.—Miscellaneous, 321. Proposed Changes in the Mining Law; The Duty on Lead; Miscellaneous, 322. The Integral Quicksilver Mines; A Boon in Comstocks, 323. The Olympia's Feat; Miscellaneous, 324.

MISCELLANEOUS.—South African Gold and Diamond Mines; The Value of Copper; Mexico and the Silver Question, 325. Results from Heavy Blasting; To Resume on the Gold Bank Tunnel; For a School of Mines. 326. Gold Mines of Plumas; The Electric Search Light in Shaft Sinking; The Outlook in the Kootenay District, 327. Assessment Work for 1893, Foundry Notes; Slickens, 324.

MECHANICAL PROGRESS.—Waste Heat Energy Utilized; Nine Hundred and Ninety-Nine; Sustaining Power of Ball Bearings; Early Wire Drawing; For Cooling Condensed Water; Blacking for Sheet Iron; Mattresses for River-Bed Protection; To Prevent Rear-End Collisions; The Dawson Steel Process, 328.

SCIENTIFIC PROGRESS.—The Origin of Petroleum; Separation of Iron and Alumina; When Coal is Dangerous; Lithocarbon; The Tonnage of Vessels; The Longest Ocean Cable; Light Rays in the Sea, 328-329.

ELECTRICITY.—Where Accumulators are Practicable; To Utilize the Great Waterfall; Electrolysis of Gas and Water Pipes; A Definition of Electricity; Manganine for Coils; The Poor Man's Light, 330.

USEFUL INFORMATION.—Horses Should Wear Light Shoes; Cutting and Polishing Gems; A Pumice Stone Mine; The Corinth Canal; American Manufacture of Alkali; Work a Horse Will Do; A Loud-Sounding Telephone, 330-331.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 333-334.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 335.

AMONG other electric attractions at the approaching Midwinter Fair will be a great tower, elaborately decorated and illuminated by the Western Electric Company of Chicago. The contract with the company calls for the maintenance of this tower during the entire six months of the exposition. They agree to put in a large incandescent electric plant, and also to light the main buildings. The General Electric Company will construct here and run for six months the electric fountain which it had at Chicago. This fountain will occupy a large space in the eastern end of the grand court, opposite to that occupied by the allegorical fountain. This electric fountain is a perfect network of machinery. The colored glass alone which is used in it cost $1200. It has 19 outlets changeable into various forms, the outer circle producing the effect of sheaves of wheat from the sprays of water forming a circle of 14 sheaves around the entire fountain. The largest search light in the world will also be here. The lens, or reflector, is 5 feet in diameter and 15 feet in circumference, and has a capacity of 2,500,000-candle power. It will throw a light so that a paper can be read 10 miles away, and one can make out a ship with a telescope 15 miles off. The General Electric Company will also furnish 400 arc lights.

THE price of aluminum is now 75 cents per pound, and there is a strong probability that it will go down to 50 cents within a year. The Aluminum Industrie-Actien-Gesellschasft, of Switzerland, has increased its dynamo capacity to 4000 H. P., and, having made improvements in the process, will largely increase the production. Dr. Stephen H. Emmens, representative of the Pittsburg Reduction Works, aluminum manufacturers, who is now in this city, is of opinion that no price below 50 cents can be hoped for within a few years, perhaps not in this century. As a matter of fact, the 50-cent quotation is not yet in sight. Prediction that it will be reached is based wholly on the history of the metal in the past, which has declined from a maximum of $90 per pound, in 1856, to its present low figure. Dr. Emmens does not anticipate that aluminum will be as largely employed in the useful arts as some have predicted, though he has no doubt its usefulness will be much increased.

THE State of Nevada is showing a vast deal of interest in the Midwinter Fair and proposes to have adequate representation of all its fine resources. The mineral exhibit at Chicago is to be transferred entire, and, in fact, the whole display is to be brought here, with the addition of considerable new material. Governor Colcord says the people never before showed so much interest in an outside project as in the Midwinter Fair. Curiosities to be shown by the Nevada people include the Carson footprints and Sam Davis.

Proposed Changes in Mining Law.

The Executive Committee of the State Miners Association has accepted the bill framed by the special legislative committee, and it stands as the measure endorsed by the representative body of miners of California. It is settled that it will be introduced and urged in the House by Congressman Newlands, of Nevada. Mr. Newlands has been requested to undertake this service because he is in close touch with the miners of California, as well as his own and other States and Territories, and for the equally important reason that he is a member of the Committee on Mines and Mining. California has no representative on that committee. The text of the bill was printed in full in the MINING AND SCIENTIFIC PRESS of November 11th. It will be interesting to indicate the principal features of the bill which propose to change the present statutes.

In the first place, it is proposed to define in a clearer manner the method of making locations of mining claims, that paragraph in the revised statutes being made to read as follows, the words in italic being inserted in the new bill:

"The location must be distinctly marked on the ground *by posts or monuments*, so that its boundaries can be readily traced."

The following very significant modification as to the period in which assessment work shall be done is made:

"That the period within which the work required to be done annually on mineral claims shall commence at 12 o'clock *meridian* on the first day of January succeeding the date of location of such claim. When the labor required by this act shall have been performed or the improvements made, an affidavit may be filed within thirty days after the time limited for performing such labor or making such improvements with the Recorder of Deeds of the county in which the claim or mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with the conditions of this act in the performance of labor or making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made."

This paragraph is all new matter.

A succeeding provision is altered to read as follows, the words "a patent" being replaced by the words in italics:

"On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year for each one hundred feet in length along the vein, until *payment of the purchase money and a certificate of entry* has been issued therefor; but where such claims are held in common such expenditure may be made upon any one claim.

This is in accordance with the express recommendation of the State Miners Association. The following new provision is added in cases of notice upon co-owners who fail to contribute their share of expenditure for assessment work:

"*A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the Recorder of Deeds of the county in which such mining claim is situated, shall be evidence of the acquisition of title of such co owners.*"

Section 2334 of the Revised Statutes is amended by adding thereto the following:

"*And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants.*"

Section 2335 is amended by the following:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths *within the State or Territory where the claims may be situated, having an official seal.*"

The present law requires that such affidavits shall be verified within the land district where the claim is situated. The familiar provision, recommended by the Miners Association, that the presence of rock in place bearing gold, silver, etc., shall be regarded as presumptive evidence that the land is, and always has been, mineral in character, is inserted; together with the provision defining how land shall be determined to be more valuable for mineral than agricultural purposes, and providing that this chapter shall be liberally construed by the land department.

Section 2337, relating to mill sites on non-mineral lands, provides that such lands used or occupied, or *intended to be used or occupied*, may be embraced in an application for a patent, or may be made in a *separate* application for a patent. Locations of such character may reach a maximum of *ten* acres instead of five, as at present.

These are the vital changes in the present laws proposed to be made by the new measure. They include several provisions to be found in the Stewart bill, but of course they omit all that have been pronounced obnoxious to the miners of California. Several provisions which the Stewart bill proposed to omit from the laws are restored by this bill. The full significance of all changes will, of course, not be understood unless taken in connection with the context of the bill.

THE Mayflower Gravel Mining Company has just paid a dividend of ten cents per share.

The Duty on Lead.

It seems certain that the new tariff bill, now being framed by the Ways and Means Committee of the House of Representatives, will contain a provision exempting lead-silver ores from duty. The exact provisions of the bill have not yet been given out, in this or in any other particular, and will not be until the meeting of Congress next month. But the matter is at this time worthy the serious consideration of all miners in the silver States, that they may collect material and argument for presentation to Congress relative to the tariff and its effect upon the industry in this country. Since 1890, under the McKinley law, there has been a duty of 2 cents on pig lead and 1½ cents on lead in lead-silver ore, and it is believed by the great majority of miners that the removal of this duty will add the last straw to the burden the industry is already carrying.

Last year the House of Representatives passed a bill repealing these duties. By its terms it amended paragraph 199, Schedule C of the McKinley law, so as to read as follows:

"Lead ore and lead dross, 1½ cents per pound; provided that all ores carrying silver and lead at the same time, except silver ores containing lead, shall pay a duty of 1½ cents per pound on the lead contained therein, according to the sample assay at the port of entry; and provided further, that ores containing silver and lead, in which the value of the silver contents shall be greater than the value of the lead contents, according to sample assay at the port of entry, shall be considered silver ores and as such shall be exempt from duty."

The above measure passed the House by an overwhelming vote, the division being on party lines. But the Senate was then Republican, and it stood no chance there. The essence of the bill is contained in the last proviso. Of course we do not know that the coming Congress will shape its legislation on these lines, but it is reasonable to suppose that it will. Congress and the President all being committed to tariff reform, it will be seen that a very serious emergency confronts the lead-silver miners.

Previous to 1890, according to the rulings of the Secretary of the Treasury, all silver-lead ores containing a greater proportion of silver were admitted free of duty. As a consequence there was a very strong incentive toward corruption of customs officials to the end that foreign ores seeking importation might be listed as containing more silver than lead. The majority, of course, were really silver ores. Others were not. Corruption did exist and it was freely charged in the debates in Congress on this measure that the United States Government had been swindled out of large sums of money, running into the millions. The Collector of Customs at El Paso, Texas, is said to have been removed from this cause.

J. B. Grant, of the great Omaha and Grant Smelting and Refining Company, declared on affidavit that during 1889 the smelting works had received large quantities of Mexican ore from Mexico which contained more lead than silver, but which came in free of duty.

It was asserted in the majority committee report to the House of Representatives that the measure was in the interest of the silver-miners of the United States, 75 per cent of whom produced "dry" ores, and that the silver-lead ores of Mexico were needed for fluxing ores. But Congressman Sweet of Idaho combated this statement and produced figures showing that only about one-third of the American product is "dry" ore. Besides, it had been declared by experts that a good fluxing ore must contain at least 20 per cent of lead; whereas the average of ore imported from Mexico was but 17 per cent. He said the measure was favored by those smelting companies which owned mines in Mexico and smelters in the United States, and was in the interest of no others.

The minimum at which the lead-silver mines of the Cœur d'Alene district can be operated at a profit is $4 per 100 pounds, considering silver as a by-product. If silver were worth $1 per ounce, of course many of these mines could be operated without so much regard to the value of lead. But when both are down to bedrock it is exceedingly difficult to find a mine whose special advantages are such that it can be run without loss. The cost of labor in Mexico is from one-third to one-sixth the cost in the United States; and it would seem that the miners of this country must have the arbitrary assistance of a tariff duty in order that they may not be driven altogether out of the business by the lower-cost producing mines of Mexico. They are near enough out now. Lead is to-day 3 3 cents per pound, and it is protected in ore by a duty of 1½ cents. What will happen if the duty is removed?

IT is announced that to induce exhibitors at the World's Fair to remove their exhibits to Chili for the mining and metallurgical exhibition, that government promises to pay the cost of transportation for freight and exhibitors and their workmen both ways. It is said every facility will be

afforded them for displaying their exhibits, and the power will be furnished free. There is in Santiago a large building suitable for the purpose, and the government has appropriated $150,000 for expenses. Francisco J. Ranan, representative of Chili in Chicago, has the matter in charge. The opportunity for an exhibit of mining appliances is certainly very great and should not be overlooked by our machinery firms. The exposition will begin in April and continue throughout several succeeding months.

The Integral Quicksilver Mines.

The wealth of the quicksilver mines of California has long been well known. The "New Almaden," "Napa Consolidated," "Sulphur Bank" and others have returned enormous quantities of quicksilver, realizing many millions of dollars and giving large profits to the shareholders. There is no branch of mining in this country that has made such progress in cheapening cost of production. The expensive methods of 20 years since would close every mine now producing, as the per cent of metal being extracted is now so low they could not be made to pay.

Notwithstanding the fact, however, that the methods of treating the cinnabar ores have been greatly improved of late years, the supply, owing to the increased cost of working the old mines, the marked decrease in the value of other ores, and the non-discovery of new deposits of cinnabar of any considerable value, has been constantly decreasing.

The Coast Range of California, bounded by the Idria quicksilver mine on the south and the Integral mines on the north, is the only producing cinnabar belt in the United States where quicksilver has been found in large quantities, and the practical closing down of the Almaden and other of the great producers, and the fact that mines now in operation are gradually lessening their production from year to year gives special importance to the fact that at this critical juncture another Almaden is being developed in the northern part of this State. Reference is made to the very valuable and extensive cinnabar mines owned and operated by the Integral Quicksilver Mining Company in the Cinnabar district, Trinity county, California, and comprising forty-five patented claims of the usual dimensions, besides four sections of timber lands.

The chief promoter of the project for development of this quicksilver district is Prof. Archibald B. McCaw, the well-known mining engineer. Five years since Prof. McCaw's attention was attracted to the district, and he made a personal inspection of the formation and thoroughly tested the character and quality of the ore wherever found. He became convinced of the value and merit of the properties, and he set about to acquire control for the purpose of development. He caused the location of a large number of new claims, purchased the Boston group, and part of the Integral group of mines (already located), and began the work of consolidating the various interests already represented in the district. Prof. McCaw has been steadily and quietly engaged in this work for five years, and the enterprise is now in such shape that its speedy and extensive development is assured. The chief associates of Prof. McCaw in the Integral Quicksilver Mining Company are Mr. Wm. Simpson, a well-known capitalist of New York City; Mr. Wm. J. Simpson, his son, secretary and treasurer, who resides at the mines. Mr. Alexander McCaw has been superintendent and will take an active share in the work of development. Counsel for the company in San Francisco are Reddy, Campbell & Metson, and in New York, Hon. M. R. Lawrence. Prof. McCaw is president. The capital stock is $3,000,000, and the organization was effected under the laws of West Virginia.

Trinity county is in the northern part of California, and has until lately been almost inaccessible compared with mining regions even more remote. The mountains are high, precipitous and rugged; the whole district is heavily timbered and has been much neglected until latterly by the miners of the Pacific coast, although during the past 30 years rich discoveries have from time to time been made there of gold, copper, chromic iron and quicksilver. Communication has now been much improved and the district brought within easy reach of the railway.

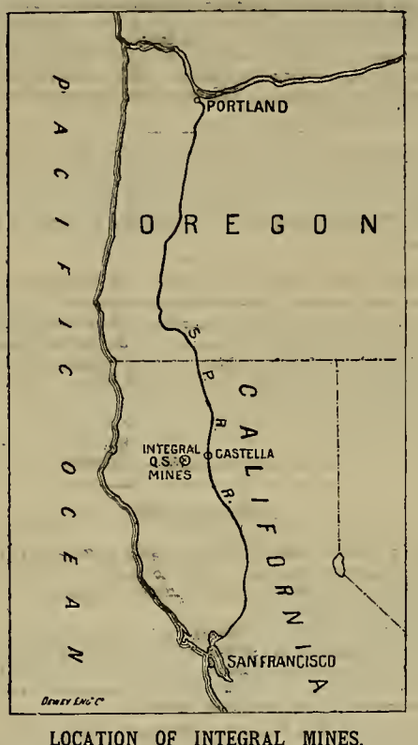
The Integral Quicksilver Mines.—This great property is situated in Sections 14, 15, 21, 22, 23 and 27, Township 38 North, Range 6 West M. D. Meridian at Integral, Cinnabar mining district, Trinity county, California, and is about 12 miles westerly from Castella, a station on the Shasta division of the Oregon & California Railroad, 317 miles north of San Francisco, at which place the Integral Company have a warehouse and other buildings, and at which point supplies are shipped to the mines and quicksilver to the railway by pack animals. All heavy machinery and freight are shipped from Redding, Shasta county, direct to the mines; but this coming year the Integral Company intend building an electric railway from the railroad to the mines, there being ample water-power for driving a heavy electric plant. A postoffice has been established at the mines, and is named Integral. The climate is very fine during the greater part of the year, there being no severe cold.

The average altitude of the mines is about 5000 feet above the sea level. There is plenty of fine timber growth (pine, fir and cedar) all over the surface of the property suitable for building, mining purposes and fuel for quicksilver furnaces.

The property is thoroughly drained to a depth of about 3000 feet near its southern boundary by the east fork of the Trinity river, and near its western boundary by the north fork of the east fork of said Trinity river, so there is an abundant supply of water for all purposes.

The property is known as the Integral quicksilver mines and comprises nearly all the known mineral-bearing territory in the Cinnabar mining district. The length of the property from its northern to its southern boundary is about three miles, and from its easterly to its westerly boundary about three miles, and has a total area of about five square miles, of which about one square mile is mineral and four square miles are timber lands.

Geology.—The geological formations are serpentines, porphyry, limestones, slates, alumina and metamorphic



LOCATION OF INTEGRAL MINES.

rocks. The ore and "gangue" are cinnabar (sulphide of mercury), native quicksilver, calcite, quartz (sometimes carrying gold), magnesite, pearl spar, pyrites and chlorite. The mineral zone is about two and a half miles long by one mile in width, the west country rocks being slates and the east country rock granites. The ore bodies are irregularly distributed throughout the formations, but the major part is in extensive "shoots" or channels in which the ore occurs in "chimneys" of every shape and size, and dipping at all angles.

These "chimneys" are usually connected by stringers or veinlets carrying cinnabar, but the ore is found in all forms and places in the mineralized zones. In the southern and central parts of the property the trend or strike of the ore channels is about southwesterly and northeasterly, and near the northern end the trend follows the swing of the mountain and course of the serpentines, "striking" to the southwest, thence westerly, and thence crossing to the southeast.

The principal mining claims are the Integral Consolidated mines, situated near the southerly end, and the Boston Consolidated group of mines at the northerly end of the mineral belt. The titles are U. S. patents. The present development work is confined principally to the Boston group of mines.

On the Boston mine two crosscut tunnels have been driven through the ore body, showing in lower level an ore body more than 100 feet thick between walls.

A complete plant, consisting of hoisting works, large boiler, engine and Cameron sinking pump with capacity to sink a thousand feet in depth, has been placed on the Boston mine, and development work is being rapidly proceeded with. Levels will be opened 100 feet apart as the shaft is being sunk. Preparations are also being made to develop the Integral group of mines; also ore bodies in many other mines in the central part of the property.

It is estimated that it will be necessary to construct not less than eight furnaces to handle the immense bodies of ore being exposed by developments.

A Knox & Osborn fine-ore furnace with 20 tons daily capacity has been constructed as a test plant, but has only been in operation for a short time this summer owing to defects in construction of condensers.

The company have had to reconstruct the furnace at quite an expense, and have built additional condensers of concrete and cement, and have lined the brick condensers with cement, and the plant, for the capacity, is considered to be one of the most complete in the State. In spite of defects in the plant, several thousand dollars' worth of quicksilver have been shipped to Messrs. Miller, Sloss & Scott, the company's agents in San Francisco.

Several coarse-ore furnaces will be erected this coming year, most of the material being already on the ground, and it is anticipated that this great property will become one of the greatest factors in the quicksilver market in the United States, if not in the world.

There is also a good sawmill, completely equipped, with a cutting capacity of from 12,000 to 15,000 feet per day, and about 1,000,000 feet of lumber have been cut and used in the various buildings, tramways and mine timbers.

There is a good store, supplied with goods requisite for a mining camp; also stables, a large boarding-house and buildings for furnace men and miners. In fact, quite a mining town has sprung up at the Boston Consolidated end of the property.

On the Integral Consolidated section some buildings have been erected in the Blockade mining claim, and a tunnel is being driven on the Integral mine.

This district is the only one in the Coast Range now showing large surface deposits which has not been extensively and at times profitably worked; consequently the field here is now the best virgin field, so far as known, in the State.

With the improved quicksilver furnaces now in use, cinnabar ore running as low as one-half of one per cent can be worked at a good profit where the ores are near the surface and easily handled, as in the case of the Boston mine.

The total product of all the quicksilver mines in California for the year 1877 was 79,396 flasks, but has declined to about 28,000 for this year, 1893.

A Boom in Comstocks.

During the past week there has been a degree of speculation in Comstock shares that has not been rivalled since the balmy days of '86. Transactions have been on an extensive scale—frequently exceeding 100,000 shares per day—and the sessions of the two exchanges have been largely attended by excited speculators; and brokers, who a month since were staggering on the brink of bankruptcy, have been worked day and night to supply the demands of buyers and sellers. It has been noticed that the speculators have mostly been persons of small means, and that large operators have been conspicuous by their absence.

It is difficult to give a substantial reason for the sudden activity in Comstock affairs. No new ore bodies have been discovered. No satisfactory assurance of change in methods of mine management has been given. There has been no reduction in transportation charges. The milling ring is not broken and their methods have not been changed. The cost of labor has not been reduced. The price of silver has not risen. In short, there is at present nothing tangible to restore confidence in the Comstock, or to give assurance that the stream of assessments will not be continued as in the past.

The causes of the "boom" seem to lie in the promise of James Rule to find a rich body of ore in the 1100-foot level of Consolidated California & Virginia; in the skillful manipulations of a jobbing ring; and in the general impression of the stock-gambling public that when matters can get no worse they must get better. The latter is, perhaps, a mere manifestation of the speculative spirit that frequently breaks out in the most unexpected guises. Operations have been chiefly in Consolidated California & Virginia stocks, which last Friday reached a maximum of $5.75, having advanced from a minimum of 90 cents in a month or more, the greater part of the advance occurring in about ten days. Other stocks, by sympathy, shared in the general advance and reached higher figures than for many months. There was no particular in which the assets of the companies were increased, or were about to be increased, so far as known, but the stocks went up just by sheer force of the "boom." The gamble was in Comstocks, and all the mining companies received a share of attention.

The excitement culminated last Friday. Saturday there was a break and the down-hill movement began. The stocks had got up just about far enough to fall hard. The retrograde movement has not, however, been steady, but has experienced sporadic fluctuations which have sent prices up toward the vicinity of the maximum figures.

Consolidated California & Virginia was driven down to $4 yesterday, and other stocks were similarly affected.

It is not at all likely that the "boom" can last. The end must come soon, if it is not already in sight, and the unsophisticated speculators will simply have their experience for their money.

The Olympia's Feat.

The cruiser Olympia, at her builders' trial trip last week, attained a maximum speed of 21.26 knots, and developed 15,000-horse power—a performance that places her at the very top of cruisers in the United States Navy and reflects the highest credit upon her builders, the Union Iron Works of this city. It has been again proved that cruisers of the finest type, answering in speed and equipment every requirement of modern naval warfare, can be constructed on the Pacific coast. Her trial occurred Thursday of last week in Santa Barbara channel. The story of her accomplishment is best told in the words of Captain Charles Miner Goodall, who was in command:

"We turned at Point Concepcion and made the specified course of 43 miles. Reaching the end of the course, we turned round and ran back to westward. She had been increasing her speed all the time until she reached her maximum of 15,000-horse power, which sent her through the water at a speed of 21¼ knots an hour. This was on the course before we struck heavy winds.

"The average on the western run was 20.54 knots an hour. For about one-half the distance we were in a heavy head sea, facing a 30-mile wind, which, added to the speed we were going, made a wind force of fully 50 knots an hour.

"I never saw anything like her in my life for sea work. She is the easiest ship I was ever aboard of. When she is running with the swell on her quarter her roll is slow and easy, and when the sea is in any other direction she is as quiet and steady as a platform on shore."

"What speed ought the Olympia to make in calm weather?" asked the reporter.

"Certainly better than 21¼ knots. At least a quarter of a knot faster; perhaps better than that. On this trip, in addition to the head sea, she labored under the disadvantage of some foulness. She has not been on the drydock for two months; there is nothing on her bottom but tallow, and quite a crop of grass and barnacles has attached itself. This probably held her back half a knot. Besides, she burned a great deal of fine coal. Most of the lump coal was reserved. There is no doubt in my mind that she will easily maintain the speed she made Thursday on the official trial trip, and my judgment is that she will increase it something over half a knot. Her engines worked with absolute perfection. There was not a single hitch, nor the least trouble of any kind.

"I think she is not only the fastest vessel in the United States navy, but the handsomest man-of-war in the world. Her lines are ideally beautiful, and her construction the very best. Besides, she is roomy and comfortable for all on board. The admiral and skipper who get the Olympia ought to be proud of her."

Records made by cruisers in other navies are as follows:

Cruiser—	Knots.
Nueve de Julio (Argentine)	22.7
Blake (England)	22.0
New York (United States)	21.0
Kaiserin Augusta (Germany)	20.7
Reina Regente (Spain)	20.6
Australia (England)	18.8
Jean Bart (France)	18.6

The cruiser Columbia, which had her trial last week on the Atlantic, is said to have made 22.87 knots under forced draught. The indicated horse power of the Columbia's engines is 20,000 at a sustained speed of 21 knots an hour, or 23,000 at the maximum.

SENATOR PERKINS, who has returned from Washington, says it is designed to devote the $12,000 per annum realized for California from the sale of lands to the maintenance of the School of Mineralogy at the State University, if the bill for that purpose passes. It has already passed the Senate, but of course at the regular session it will be necessary to pass both houses again, before it can become a law. The sponsor of the bill in the Senate is Senator Dubois of Idaho; in the House, Representative Wilson of Washington.

MELVILLE ATTWOOD gives his test for small specks of gold in quartz or rocks as follows: The precipitation of mercury upon gold from a solution of mercuric cyanide is a very delicate and easy test for gold in rocks, even when in the form of specks so minute as to be only visible by the aid of a powerful lens. The yellow color (by the use of the blowpipe) persistent at a red heat of the speck to be tested, and the instantaneous whiting of it occasioned by the cyanide, may be taken conjointly as proving it is gold.

THE Church Gold Mining Company, of El Dorado, has paid in all four dividends—two of ten cents and two of five cents.

Assessment Work for 1893.

The bill for the suspension of assessment work on unpatented mineral claims for 1893 has passed Congress, been signed by the President, and is now law. There was such a heavy demand for last week's issue of this paper containing the text of the law that the edition was exhausted. The full text is therefore reprinted:

An Act to amend section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, relating to mining claims.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the provisions of section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, which require that on each claim located after the tenth day of May, eighteen hundred and seventy-two, and until patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year, be suspended for the year eighteen hundred and ninety-three so that no claim which has been regularly located and recorded as required by the local laws and mining regulations shall be subject to forfeiture for non-performance of the annual assessment for the year eighteen hundred and ninety-three: *Provided,* That the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed on or before December thirty-first, eighteen hundred and ninety-three, a notice that he or they, in good faith intend to hold and work said claim: *Provided, however,* that the provisions of this act shall not apply to the State of South Dakota. This act shall take effect from and after its passage.

THE new law suspending assessment work for 1893 requires that all persons who desire to secure its benefits shall file notice with the Recorder before December 31, 1893. The following form will doubtless be found as good as any:

NOTICE.

Notice is hereby given that the undersigned, owner of the —— mining claim, situated in —— mining district, —— county, State of ——, being desirous of taking the benefit of the act of Congress, entitled "An Act to Amend Section 2324 of the Revised Statutes of the United States, Relating to Mining Claims," approved November —, 1893, hereby declare that —, in good faith, intend to hold and work said claim.

Witness our hands this — day of ——, A. D. 1893.

[Signature.] ——

The law does not require an affidavit in filing this notice.

Foundry Notes.

THE Union Iron Works has petitioned the Ways and Means Committee to take the tax off coal so they can import from Australia, thereby better enabling them to compete with the ship-builders of the world.

Two 3½-foot Huntington mills have just been shipped by the Fulton Engineering and Ship-Building Works, one to Chamberlain & Price, Torres, Sonora, Mexico, the second to E. G. Starber, Silverton, Colo. It is proposed by the Mexican people to use the mill for working gold tailings.

THE Buckeye Bell Foundry, of Cincinnati, Ohio, has offered a chime of bells for the Midwinter Exposition, which will be erected in a tower of one of the buildings. The chime will consist of ten bells. The weight of the chime will be about 10,000 pounds and it will be patterned after the chime exhibited at the Chicago Exposition.

EIGHT additional armor plates for the monitor Monadnock have been received at the navy yard at Mare Island. The plates are designed for the sides of the monitor and their aggregate weight is invoiced at 63 tons. These plates were hoisted from the schooners by means of steam shears and deposited on flat cars for transporting along the drydock, where they will be fitted and seoured in position.

THE castings for the Firth (Ferris) wheel for the Midwinter Fair are being made at the Fulton Engineering and Ship-Building Works. They include flanges, arms, hub, etc. The arms will be 50 feet in length, and will weigh altogether about 16 tons; the flanges 3 tons. The wheel will be about 120 feet in diameter, and will no doubt be one of the very attractive features of the Midwinter Fair.

THE steamer Bawnmore, which several months since was badly hammered on the rocks up coast, has just come out of the dry-dock of the Folton Engineering and Ship-Building Works, practically a new vessel. Amongst other things done was the repair of the badly damaged stern-post, which was altogether one of the most difficult jobs and probably the largest of the kind ever undertaken on the coast. The post is 37 feet long, 10x8 inches in width, and had to be welded in ten places, straightened and refitted to the stern-frame. Much the same thing had to be done to the rudder-post, 30 feet long, 6x8 inches thick. About 60 plates were cut from the bottom of the vessel and either straightened and refitted, or replaced by new. The work of repair is now practically done.

THE Fulton Engineering and Ship-Building Works have under way the construction of a fine side-wheel ferry boat for the North Pacific Coast Railway Company, for use on San Francisco bay. Her dimensions will be 255 feet length, 38½ feet actual hull beam, 60 feet over guards, and 17 feet depth of hold. She will draw 5½ feet. Her engines will have 56 inch cylinder, 144-inch stroke; boiler pressure, 60 pounds; horse-power, 1300; wheel diameter, 28 feet. There will be two fire-box boilers and two steam chimneys. Her speed will be 17 miles per hour. There will be the usual walking beam. One peculiarity will be the use of a surface condenser, instead of a jet condenser, the latter of which are used by all ferry boats on the bay. The boat is to be finished by next June.

Sliokens.

THE Shasta County Miners' Association has decided to investigate the Farwell process of treating refractory ores.

NEW ore discoveries are reported daily in the Black Hills by the prospectors who are arriving in Deadwood after completing their annual assessment work.

FREDEARCK MUIR, president of the Harqua-Hala and De Lamar Mining Companies, is on a visit to the mines, the former located in Arizona, the latter in Idaho.

THERA is hope that the Seven Devils copper mines, near Baker City, Or., will be worked the coming season on a large scale. An effort is now being made to secure transportation facilities.

THE Murray Creek Mining Company has incorporated in Oakland, with a capital of $80,000. The directors for the first year are Joseph Huber, Herman Harfst, William Miller, Diedrich Husing and Heinrich Gloy.

THE Grass Valley *Union* severely criticises the Osborne Hill mine because the employes, married men and single, have been requested, virtually commanded, to board at the company's new headquarters, near the site of the mine.

THE proposition to send Idaho's mineral exhibit, now at Chicago, to San Francisco for the Midwinter Fair is being agitated in Idaho. It is favored by many of the leading citizens, including some of the State officials, and will probably be done.

THERE are many Colorado mining men in California now, and if the depression in silver continues there will be more. Notwithstanding the fact that there are good gold fields in Colorado their extent is limited, while in California opportunities are limitless.

A MINER in the Pennsylvania mine, near Grass Valley, was descending a shaft when he heard the car coming. He knew that his only hope was to brace himself for the shock and seek to throw the car from the track. He was successful, but sustained very serious injories.

THE Elsinore Coal and Clay Company has been incorporated. Principal place of business, Riverside. Capital stock, $100,000, with Margaret C. Graham and Jane E. Collier of South Pasadena, James Hill and Geo. C. Hill of Los Angeles, and Wm. Collier of Riverside, as directors.

THE Pilot Peak Mining Company has organized with M. E. Sanhorn, of Yuba City, as president, J. N. Turner as vice-president, and E. W. Abbey, as secretary. The company has acquired possession of the Pilot Peak mine. P. T. Turner will be superintendent. Much of the stock of the mine is owned at Yuba City.

THE Morning Star mine at Iowa Hill has declared another dividend of $1 per share. The mine looks exceptionally well, and a large number of dividends are still in store, says the Colfax *Sentinel*. Of late the company has made considerable improvements, but this has not hindered them any in paying regular dividends.

MOONY BROS. of Gold Run have sold their mine, the Gold Ring, to the Gold Ring Mining Company of Oakland for $12,000. The sale was negotiated by Bert Moody and James Gayety. The Colfax *Sentinel* says the price paid is a very reasonable one, and the investors will find they have a good property. The Gold Ring is a good gravel mine, and $15,000 has already been taken out by the former owners.

ARTICLES OF INCORPORATION of the Gold Ring Mining Company have been filed with the Alameda County Clerk. The capital stock is $500,000, divided into 100,000 shares of the par value of $5 each. The subscribers are E. Alberto Moody, $480,000; Thomas F. Graher, $5000; James M. Gavetty, $5000; Almon Ames, $5000, and Charles S. Moody, $5000. These gentlemen are also the directors of the corporation.

HEREAFTER every person applying for land under the homestead laws, who is a naturalized citizen of the United States, or who has declared his intention to become a citizen, will be required to file with his application a duly certified copy of his certificate of naturalization or of his declaration of intention, as the case may be. These are the instructions of the honorable commissioner of the General Land Office, and they will be strictly observed.

PRESIDENT WARNER of the Bimetallic League has issued a call throughout the country to members of the league, saying the exigencies created by the unconditional repeal of the Silver Purchase law renders it important that a conference of active bimetallists be held at an early date to consider the changed situation and determine upon a future course of action; therefore, a conference is called to meet at the headquarters of the league in Washington on December 15th.

ARTICLES OF INCORPORATION of El Encino Consolidated Blue Gravel Mining Company have been filed with the County Clerk of Alameda. The corporation will engage in a general mining business. The capital stock is $100,000, divided into 100,000 shares of the par value of $1 each. The shareholders are: William McDonald, $5600; E. C. Rigney, $1820; A. M. Benham, $14,820; W. R. Thomas, $14,850; J. W. Benham, $2000; F. Chappellet, $4200; J. S. White, $20,000. The directors for the first year are Chappellet, White, Benham, McDonald and Rigney.

AN old Colorado miner will show at the Midwinter Fair a miniature model which he has had on exhibition at the World's Fair of a mine in full operation. He has reproduced in miniature the workings of the Saratoga gold mine of Gilpin county, Colorado, in which he worked for a number of years. With a labor and patience and a skill that only an experienced miner could exercise, his exhibit shows the exact workings of this mine, even to its smallest details, with wonderful exactness. The entire working, both of the surface and underground, are presented in one view and can be comprehended and fully learned in a short study. During this summer hundreds of mining men and mineralogists, professors and teachers from this country and Europe, have looked at it, examined it thoroughly, and the universal expression of opinion has been one of merited praise for its completeness, exactness and simplicity. Such has been the success of this model that it will go to the Midwinter Fair in California, for which a concession has already been granted, and where it will be fully appreciated. In May it goes across to Antwerp to the great international exhibition to be held there.

South African Gold and Diamond Mines.

Mr. Hepburn Prentice, mining expert, who has just arrived in San Francisco to remain during the winter, has, during the past three or more years, devoted himself exclusively to personal inspection of the leading mining fields of the world, and has in consequence acquired a fund of information that is valuable, voluminous and interesting. Mr. Prentice is an Australian, and has a thorough acquaintance with the mining regions of that country. In 1891 he made a visit to South Africa, where he spent some time in the gold fields and diamond fields. Thence he went to England; thence to South America, in British Guiana and Colombia; thence to England, and thence to the United States, where he has spent a year or more. He has just returned from a two-months trip to the mines of British Columbia, and will now devote some time to California. Mr. Prentice told many interesting things the other day to a representative of the MINING AND SCIENTIFIC PRESS about his experiences in and impressions of some of the various mining fields he has visited.

"I was in Johannesburg in 1891," said Mr. Prentice, "when there was a great deal of activity. The Transvaal was beginning to make a deal of noise in the mining world. All the residents were very enthusiastic about the future of the country, and were of opinion that the reefs were inexhanstible. The average dip of the reefs is about 45 degrees, and it was confidently declared that, after reaching a certain depth, they assnme a horizontal position and that they could be worked for miles by drifting. This is, to my notion, all supposition. The ledges are a conglomerate composed of water-worn pebbles, cemented together by a little clay matter and oxide of iron. The gold is found fine, crystalline and angular, never in the qnartz, but in the material inclosing the pebbles. It was at first thought that the reefs were an ordinary placer formation, but that theory has been exploded, and it is evident that the gold was simply leached out from the conntry rock and been deposited in the conglomerate by the usual agencies. Near the surface the conglomerate breaks up easily; hut, as one descends, it is more refractory—pyrites begin to appear and pebbles to disappear, and it becomes one solid quartz mass. It has of course been rendered thus compact hy the enormous pressure. The ledges vary in width from a few inches to eight or ten feet, and as many as three are often found close together.

"The principal district is, of conrse, Johannesburg. When I was there shafts were down 300 feet, hut they have gone much farther since. I regard these fields as the best in the world; hut I do not agree with the conviction so universal in Johannesburg and elsewhere, that they are limitless. My opinion is, that the limit of production will be reached in a few years. The first crushings of gold on the Rand realized 3½ ounces per ton; now the average is from 9 to 11 dwts. The value of the ore has steadily fallen off with increasing depth of the mines. The increasing expense and difficulty of mining, and the greater refractoriness of the conglomerate, will be very important factors in determining the future output.

"There are other fields besides the Rand, though of less importance and extent. In the Barberton, for instance, are found true quartz ledges which are rich in patches.

"The cyanide (MacArthur-Forrest) process was just being installed when I was in the Transvaal. Its great value, hoth there and elsewhere, has been fully demonstrated.

"The climate, the government, the people, the cost and and the manner of living, in the Transvaal, have been fully described by others, and their various characteristics are sufficiently weil known. It may not be amiss to say, however, that the climate is one of extremes—warm in summer and cold in winter. There is little or no snow at Johanneshurg. The organizations of the several South African States are various; hut the dominant interest is English. There are many Americans, particularly mine managers. I expect that some day the Transvaal, the Free State, Mashonaland, and prohahly Cape Colony, will all be federated under one government; that seems to me to he the destiny of South Africa.

The Diamond Fields.—"The Kimberly mining fields were of special Interest to me, as well as to all others who visit them. Kimherly is about 600 miles north of Cape Town, in the heart of South Africa. Johannesburg is 300 miles farther on, in the same direction. The trip from Cape Town to Kimberley is hy rail and, since I was there, Johanneshurg has rail connection with Kimherly. Sonth African diamonds were first found in the alluvial gravel along the Vaal river, hut afterward in the loose limey soil of the upland. They are generally mined in open cuts of great extent and of a depth of from 300 to 500 feet. The first claims were all 30 Dutch feet square (31 English feet); hut these were afterward hought up and consolidated by large proprietors. The Kimherly mine, for Instance, contains 1300 of these claims. As stated, the soil is loose on the surface, hut it passes graduallywith depth to a solid rock, called the 'diamond blue.' The formation is shale and diorite, with horizontal bedding. The shale is fossiliferous, carrying carbonaceons matter, which by chemical action is transformed into diamonds. Open mining has been the method generally employed. Hoisting works are located at the surface, on the embankment, and the gravel elevated from the pit in buckets by ropeways. But it has become necessary to change the system. With increasing depth the banks began to cave in, and progress became difficult and expensive. So now shafts are sunk from the surface and the 'diamond blue' reached by driftiog. It is mined and hoisted by the ordinary methods. At the surface the gravel is transported in cars to the 'weathering' fields, where it is left exposed to the decomposing action of the elements for about three months. At the DeBeers mine there were 500,000 loads of rock in one dnmp. After weathering, the process of extracting the diamoods begins. The gravel is placed in large revolving pans. It is there so acted upon by water and by 'stirrers' that the heavy gravel containing the diamonds sinks, while the lighter matter passes off at the surface. The gravel is then taken out and passed through sizing screens, all stones over about three-fourths of an inch being cast aside. The gravel thns cleaned is then sent to the sorting sheds. Here the process of 'jigging' begins. It consists of jigging the gravel in an ordinary pan, perforated with small holes in the bottom. The gravel becomes very compact, the diamonds having meantime sunk to the bottom of the pan being of greater specific gravity. The contents of the pan are then turned out on a table by a quick reversing motion. Some of the diamonds, if there are any, will then appear at the top; hut the gravel is carefully examined by means of a 'flip,' which is used by dextrous manipulators to spread the gravel out very thin, so that it may be further examined for the precious stones.

"The method of guarding the laborers, who are negroes, is very thorough and exacting. Their labor is performed in a large 'compound,' which is simply an area enclosed by a high iron fence, carefully guarded. It contains the work huildings and dwellings. The labor is hy contract. No negro is allowed to leave the compound under any pretext for three months. When he comes out he must strip naked. His clothing is carefully searched. Then his eyes, hair, ears, mouth and all other possible places of concealment are systematically examined. Afterward he is manacled and shackled, and kept in confinement for two weeks, being thoroughly physicked to discover if he has swallowed a diamond. Notwithstanding these extraordinary precautions, the loss of diamonds hy theft is great, and a class of buyers known as the I. D. B's. (Illicit Diamond Buyers) manages to thrive. Laws against the illegitimate traffic are very strict. All mines are licensed, and the discovery of all diamonds is recorded. If an uncut dlamond is found upon a person, it is *prima facie* evidence that he is engaged in Illicit pursuits, and he is severely punished. When I was in Kimberley nine I. D. B's. were captured and punished. Most of the I. D. B's. are Jews.

"There are five great diamond mines around Kimherly, principal of which are the Kimberly, De Beers, and Yagersfontein, the latter a new one and said to be the richest of all.

British Guiana Placers.—"Last year I was in British Guiana, between Venezuela and Dutch Guiana, South America. The placers are located from 100 to 150 miles inland, and are reached by river. The country is tropical and covered with heavy jungle. The placers are shallow, and are worked hy sluicing. The area of the placer country is about 100 to 150 miles hy 50. The fields vary in value, but on the whole they are worth working. The ontput in 1891 was 100,000 ounces, which was increased in 1892, and will no douht he still larger in 1893. The ownership of the fields is both foreign and native. The properties are mostly small. A few diamonds are also found in the fields, but they are rather low in quality and meager in quantity. The inhahitants hope, however, to strike a rich deposit.

"I was also in the United States of Colombia, but I had the fever, and I left without examining the mines."

Mr. Prentice's impressions of some of the British Columhia mining regions will he given next week.

The Value of Copper.

A contributor to the Prescott *Journal-Miner*, giving the reasons of the decline in the value of copper, says:

Copper was formerly largely used in bottoming ships. The use of hreech-loaders and shells during our civil war and the French and Prussian war gave an increased demand for copper which, notwithstanding the increased supply, forced prices higher than had been known during the century. In 1873, when copper sold in the United States at 30 to 31 cents currency, we imported copper, the duty on which was three cents per pound, levied to help Zack Chandler and his associate owners of the Calumet & Hecla mine, on Lake Superior, make dividends of $2,500,000 per year, and gold was at a premium of 20 per cent ahove greenbacks. The gold value of copper in Europe was 21 to 22 cents per pouod. The mines of Arizona and Montana were not opened. Steel and iron began to be used in bottoming vessels about the year 1876, and in eight years had displaced copper altogether, which caused lake copper to fall from 20 cents in 1880 to 10 cents in 1884, where it is to-day, and the United States, with development of the copper mines of the West, became exporters instead of importers of the metal. The extraordinary productiveness of new American mines, and improved methods of mining, smelting and milling, with the cheapening of transportation, has more than doubled the American production in ten years. Six years ago a French syndicate was formed to control the price of copper, millions of francs were sunk in the enterprise, and after a year the syndicate collapsed. Efforts have been made to limit the supply and advance prices, but the schemes have not been successful. It is true that the introduction of copper in all electrical contrivances has opened a new market for copper and copper wires, which is increasing annually with the extension of the use of electricity, and the price may advance several points above where it is now; but it will take a big European war of several years duration to place the price of copper at 20 cents per pound, or anywhere near it.

In referring to the decline in copper, Mr. David A. Wells says: "Copper tea kettles which sold in 1860 for $2.50 can now be bought for 75 cents, and this homely example illustrates the great decline which has taken place in the price of copper since 1860, *i. e.*, from 26 cents to 9 to 10 cents per pound, which the commercial world is agreed has been wholly due to the extraordinary productiveness of new American mines and new methods of mining and smelting, and which decline one of the most influential syndicates ever organized, with command of enormous capital, was utterly unable to prevent."

Mexico and the Silver Question.

Mr. Lionel Carden, English Consul at Mexico, in a recent exhaustive report, discusses the effect on Mexico of a further serious depression in the price of silver. He sums up his conclusions on the hypothesis that the present value of the dollar, which was 70 cents at the time of writing, falls to 60 cents. This would, he says, have the following consequences for the country:

1. The Government would suffer a direct loss of $2,016,757 on the payments it has to make abroad. It wonld also suffer an indirect loss on its customs revenue of $3,113,536, provided the purchasing power of the country in dollars did not vary from what it was in the fiscal year 1889-90.

2. As the stocks of merchandise on hand have been considerahly reduced during the past year, it is prohable that the actual loss suffered by the commercial classes would he restricted to very narrow limits, and that prices would soon adapt themselves to the altered conditions of exchange, without prejndice to the amount of sales.

3. The railway companies would unquestionably suffer at first from a rise of 30 per cent in the premium on gold, which would require an increase of 23 per cent in their net earnings in order to make it good. They would, however, find some compensation in the ordinary development of their traffic, which is increasing at the rate of about eight per cent a year, and by the opening of new traffic for export rendered possible hy the improvement in the selling price of certain products.

4. The local mannfacturing industries are practically uninfluenced by a depreciation of silver.

5. The profits of silver miners in Mexico are not affected hy a reduction in the gold value of that metal, as the greater part of the expenses of mining is payahle in silver dollars, while the increase in the cost of supplies imported from abroad is set off by the very general existence of a small proportion of gold in the silver ores. Mexico therefore can continue to produce silver profitably when countries on a gold hasis, such as the United States and Australia, can no longer do so. On the other hand a depreciation of silver would very greatly stimulate the mining of gold, copper, and the haser metals, all of which are found in more or less abundance throughout the country.

6. Finally, the profits to be derived from the cultivation of agricultural products for export would he largely increased hy a depreciation of silver, while those intended for home consumption would not he affected by it one way or another.

"In striking a balance between the advantages and disadvantages arising to different interests in Mexico from a depreciation of silver it must he borne in mind that the losses which would he sustained hy the Government and the railroad companies are essentially limited in their amount, whereas the benefits which would accrue to certain of the productive industrles are susceptible of indefinite extension.

Dssquamation and Decay of Rocks and ths Formation of Bowldsrs.

IN THREE PARTS—PART II.

Written for tbe MINING AND SCIENTIFIC PRESS by Henry G. Hanks, F. G. S. A., F. G. S., ex-State Mineralogist.

The scope of this paper will be the history of stony fragments from the time they are broken from rock masses until they become wholly disintegrated and reduced, not necessarily to their elements but until they become impalpable powder, during a period of time impossible to measure accurately, but in which elements may have interchanged many times. Ovid's poetical idea of the metamorphoses of human beings finds a parallel in inanimate nature. Just when and how the rocky strata of the earth's surface were formed is quite foreign to the purpose of this investigation, nor may we here inqnire by what force fragments were detatched and scattered over the face of the earth. But we may assume that any rock detatched fragment, great or small, hard or soft, will immediately commence to weather to bowlder form. If we doubt we have only to observe the operations of nature in the field. Bowlders in all stages of formation can easily be found. The weak parts of irregular masses of rock are the corners and angles; these first yield to the disintegrating forces, and the separatlon of secondary fragments or scales always leaves the parent bowlder more spherical. This operation goes on rapidly in soft stones, more slowly in hard ones, until they are all finally reduced to sand. While this operation is only finished durlng long periods of time, newly broken fragments are continually starting on the same road. When individuals of one series of bowlders are nearly or quite reduced to sand, others are just beginning to scale off, so that while some bowlders are ever in the last stages of decay, others take their places, the crop never fails, and the surface of the earth is never wlthout the normal supply. Nor do they keep pace with each other on the road to destruction. The nature and physical properties of rocks determine the life of each bowlder and the time when they shall wholly decay. The harder rocks endure for centuries and outlive many crops of softer bowlders which weather, moulder, and wash away, while those of more enduring quartz remain almost unaffected, although they too yield at last. This is why such great collections of quartz bowlders are so frequently observed. Quartz containing pyrites shares the same fate as softer stones, but the decay is less rapid. The elements of decay lurk in the fugitive galena, pyrite-mispickel and other sulphides, which first moulder or part with their elements, leaving dlvided quartz the sooner to disintegrate. Pure white vein quartz, being the most endurlng, is finally left. It ls a common thing to see in our hydraulic mines soft bowlders soon mouldering into heaps.

Bowlders already formed or partly formed have been frequently noticed ready to fall on slight disturbance. By this I mean that, under certaio conditions, rocks generally stratified divide naturally into blocks which desquamate while still in their original beds and form incipient bowlders. Geikie (text-book of geology, folio 397) has figured an example of this character. There are at least two localities in California where this may be seen—one near Sulphur creek, Colusa county, and the other on the grade from Smith's creek to the summit of Mount Hamilton. The former is the most characteristic. There are probably many other instances of this occurrence, but these attracted my particular notice.

The operation of bowlder weathering ls sometimes temporarily suspended, but the inexorable law resumes its work when conditlons change. I have recently noticed an example of this nature. On the stage-road between Blocksburg and Harris, in Humboldt county, may be seen large outcrops of a rugose, rocky formation which a closer examination shows to be conglomerate, called also puddingstone (farcilite of Klrwan) aod in Latin *calculus compositus* and *saxa aggregata*. The surface of the hill is covered with large, rounded bowlders of this conglomerate, from which the ancient bowlders and pebbles are continually falling, and upon which the interrupted weathering is resumed. In the course of time, all will disappear. The ferumloating cement seems to be ferruginous sand.

Interesting examples showing the effect of the temporary suspension of this law may be seen on the bars of Mad river, in Humboldt couoty. There are many rounded bowlders of rather fine-grained conglomerate evidently from the locality above mentiooed. Yielding to the law, they are gradually becoming less in size. That they will eventually become wholly disintegrated, and the elements and minerals they contain be left free to form other combinations and take new part in the economy of nature, cannot be doubted.

At the same locality, specimens illustrating the effect of this law on minerals having different degrees of hardness are abundant. A fine-grained, rather hard sandstone and a many-colored jasper—itself a metamorphic rock—both weathered into bowlders, are met with, intersected by small veins of other minerals generally white. Some of these seams are of quartz and others of calcite—harder in the first instance than the inclosing rock and softer in the latter case. The quartz is now in ridges, while the calcite near the surface has weathered away, leaving channels, and the jasper in the condition known to mineralogists as "hacked quartz."

A similar conglomerate which weathers into rude columns and castellated peaks, that from a distance resemble the works of man, covers a large area in Esmeralda county, Nevada, and it is common in many other parts of the world.

Another example is the pebble-strewed sea beach at Pescadero, San Mateo county. These pebbles are washed from decomposing conglomerates which lie in extensive beds at this locality.

The first nutice of the formation of bowlders by weathering was made on eruptive rocks of the nature of basalts, traps and lavas.

As early as 1776 the following was published: Raspe (An Account of Some German Volcanoes, etc., London, 1776, fol. 63), writing of black and gray lavas in "concentric globular slate-like or indeterminate forms," describes them thus: "Though extremely hard and compact, they are, however, but slowly dissolved or affected by air, since exposed to it for many centuries, they get a white grayish color which now and then is found penetrating for a tenth of an inch into their harder and deeper-colored inner substance."

Faujas de Saint Fond, both in his great work (*Recherches sur les Volcans éteints du Vivarais et du Velay*, Paris, 1778, fol. 154) and in *Mineralogie des Volcans* (Paris, 1784, fol. 40), describes masses of basalt in spherical form. In both works these bowlders are figured, in the former *planche* 1, and in the latter *planches* 2 and 3. These figures and his descriptions show that they were weathered bowlders just such as I have seen in California and Arizona at several localitles.

The most remarkable bowlders described by this author were near Pradelle, in Haut Vivarais, France. They were very numerous. The largest was 45 feet in diameter, and the smallest 4 inches and 3 lines in greatest diameter and 3 lnches in its smaller.

This author was of the opinion that lava bowlders were sometimes formed while in a liquid or semi-fluid state, and in other cases naturally by weathering.

"There is no doubt that bowlders are sometimes formed in this manner, which, nevertheless, have the roundness of those basalt ones of which I speak. The following observations I have made on the position, contexture and accumulations of these bowlders persuade me that the basalt sometimes naturally takes the spherical form." (Fol. 155.)

Rev. James Douglas (A Dissertation on the Antiquity of the Earth, London, 1785, fol. 49.) thus vaguely expresses the same idea: "The pebbles that are found on the seacoast and in many beds of the earth do not receive their form from attrition only, but have been so rounded in their original structure in the beds of matter from which the water or other revolutions nf the earth have at some distant period separated them. They have mostly, like some flints, been originally created in nodular forms. Attrition by water may have injured their surface, but they do not certainly owe their recent form to this latter cause. This inquiry, as it may be seen at first sight, would admit of an elaborate treatise to explain it in a satisfactory manner."

HENRY G. HANKS.

Results from Heavy Blasting.

A very interestlng paper has lately been read before the New Zealand Institution of Civil Eogineers, says an exchange, on the subject of heavy rock blasting—granite, gneiss and limestone—in large blocks. It appears that in some recent operations on an extensive scale for public works, large blasts were employed, the rocks varying from bedded and joined gneiss to homogeneous masses of granite, and on an average one pound of dynamite dislodged ten tons of stone, the total amount of charge being usually decided on this hasis. The separate charges were proportioned in the ratio of the cubes of their least resistance, and this latter was divided by 35 for dynamite; 36 for gelegnite; 43 for gelatine dynamite; 50 for blasting gelatine; and 12 for blasting powder.

It seems that blasts containing three tons of explosives and another of seven tons were each fallures, as they broke up the rock too much. It was found that charges of from one-fourth ton to one and a half tons were the best, but this class of hlasting hardly answers with a line of least resistance exceeding 40 feet. Beyond that the elasticity of the rock along this line becomes too great for the resistance of the back off which the charge works; and, instead of throwlng the front out, the explosion may merely develop an undulating movement radiating from the charge. The best results were obtained where the rock had one or more loose ends with a nearly vertlcal face, a strong toe at the quarry floor level being usually first removed by hand hlasting before firing the last shot. The length of the adit was made as nearly half the length overhead as practicable, while the most even results were obtained if 15 multiplied by the least resistance was adopted for the interval between the chambers, and even less with irregularly shaped blasts.

To Resume on the Gold Bank Tunnsl.

The Nevada City *Transcript* is informed that operations will soon be resumed on what was formerly known as the Gold Bank tunnel, a mining venture of gigantic proportions inaugurated by Francis Burns a few years ago. The name of the present company is the Grass Valley Rallway and Tunnel Company of New York. Another change is to be made in the name and the company is to be reorganized.

If carried out, this will be one of the largest and most important mlning enterprises ever undertaken on the coast. If the original plans are followed the tunnel which Burns started will be driven ahead as previously contemplated. It starts at a point on the South Yuba river, near Hoyt's old crossing, about four mlles west of this clty. In its course the big tunnel will pass close to the principal mines now being operated in this district, and will drain them to a much lower depth than any of the present drain tunnels; in fact, this is one of the objects in running the tunnel, as the royalty to be received from the mining companies for the privileges of draining will of itself be quite a handsome income. The tunnel is to be four or five miles long, and in its course will tap the Spanish, Nevada City, Wyoming, Champion, Merrifield, Mountaineer, Providence, California, Fortuna, Reward, New England, Pittsburg and other mines in thls district, and then be continued to the Grass Valley district, where the Idaho, Maryland and other mines can be drained. Branches are to be run from the main tunnel at different points. One of these branches will drain the Gold Flat section.

The value of this deep drainage is appreciated by all miners and mine-owners, as operating expenses would be greatly reduced. Heavy and costly pumping machinery will not be required in many places where it is now absolutely necessary, and scores of mines could be worked to a great depth without the outlay of capital now needed.

It is firmly believed that many undiscovered quartz ledges will be encountered in driving this tunnel, and that it will also be the means of still further exploring some of the mines that have been worked for years. It is further expected that sufficient pay rock will be taken out to materially aid in the cost of construction, with the great possibility of unearthing one or more very rich mines.

Prof. George Treadwell, who is at present in this city, is to be the superintendent. He expects to resume work at the tunnel before long.

For a School of Minss.

The following bill, introduced by Senator Dubois of Idaho, passed the U. S. Senate under suspension of rules, and there is a good prospect that it will be re-presented at the coming regular session of Congress and become a law. The bill is supported by Senator Perkins of California:

A Bill to Aid the States of California, Oregon, Washington, Montana, Idaho, Nevada, Wyoming, Colorado and South Dakota to Support Schools of Mines.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That each of the States of California, Oregon, Washington, Montana, Idaho, Nevada, Wyoming, Colorado, Minnesota and South Dakota shall annually receive twenty-five per centum of all moneys paid to the United States by each of the said States for mineral lands within the said States, for the maiotenance of a school of mines in each of the said States; *provided*, that said sum so to be paid shall not exceed the sum of twelve thousand dollars per annum to each State, nor shall it exceed the amount annually expended by each of the said States for said school of mines.

SEC. 2. That before any money shall be paid to each of the said States under the provisions of this act the Secretary of the Interior shall certify to the Secretary of the Treasury that each of the said States ls maintaining a school of mines within its borders in which students in attendance are given instruction in chemistry, metallurgy, mineralogy, geology, mining engineering, mathematlcs, mechanlcs and drawing, and that the students in attendance from other States are received into said school of mines on the same terms and conditions that the students from the said State are received.

SEC. 3. That the board of trustees of each of the said school of mines shall make a report each year to the Secretary of the Interior of the number of studeots in attendance at such school of mines, the State of which they are inhabitants, and the general course of studies pursued in said school, and the amount expended ln the support of said school.

Gold Mines of Plumas.

In course of a review of new mining enterprises in Plumas county, the *National Bulletin* says:

Among the new enterprises inaugurated during the season drawing to a close is that of the Quincy Mining & Water Company, a corporation which Chas. R. Thompson of Spanish Ranch was instrumental in organizing. Messrs. O'Brien, White, Ralston and Hall became interested, and during the past several weeks the company has had employed in connection with its property about 70 men, repairing the 40-mile ditch, flumes, tunnels and reservoirs. A restraining dam across Spanish creek is to be constructed, thus enabling the corporation to work the large area of mining ground now under its control. We are confident that next season will find it operating on a large scale, much to the benefit of themselves and the county generally.

Another important enterprise now maturing is that in which Col. Day and Messrs. Lathrop, Lewis, Booth and others, through the efforts of F. E. Thomas, have become interested. Not long since the *National Bulletin* noted the purchase by Col. Day of the Hungarian Hill water ditches and mines, and the intention of the purchaser to conduct the water across Spanish Creek canyon to the Bell mine for power purposes. Since that time, Col. Day and his associates have acquired over 900 acres of placer mining ground covered by the waters now under their control. Several men have been at work repairing ditches and flumes, so that as early as possible in the spring placer mining there will begin on a large scale. That rich returns will be secured, the gold obtained in that vicinity in years past; the amount of virgin gravel deposits owned by the company and its increased facilities for working them, argue it to be a certainty. It is intended that placer mining shall be prosecuted on the ground mentioned while the company next spring lay its pipes across the canyon of Spanish creek and cut a ditch to the Bell mine.

Of very great importance to this community are the arrangements just made by ex-Senator Kellogg for the development and working of the Elizabethtown channel, north of town. He informs us that he has entered into a contract by which capitalists are to take charge of the property, put in the necessary machinery and develop the mine. It is expected that work will begin this fall and that quite a number of men will be employed. Here undoubtedly is one of the best drift gravel propositions in this part of the county. The thousands extracted in early days from the placers near old Elizabethtown, and later on by Loring & Leavitt from the "Riverdale," a part of the Elizabethtown channel lying immediately above the Kellogg property, proved conclusively the great wealth that in past ages has been dumped into this canyon. Parts of the channel have been fabulously rich, and there is no reason to doubt that the virgin ground of the Kellogg and of the Loring & Leavitt properties contain equally rich gravel deposits. Properly developed, as we assume it will be, old miners acquainted with the property expect it to become one of the most important enterprises in the county. That its successful operation will be of especial benefit to Quincy can be seen at a glance.

Since writing the above we learn that the Loring & Leavitt mine also has been bonded to, and will be worked by, the same parties who have the Kellogg property.

Still another placer mining enterprise, east of Quincy and near the old Parker place, has matured—the Northern Placer Mining Co., of Pittsburg, of which E. J. Sudden is president. This company, during the past summer, under the superintendency of its organizer, Pitner Trayner, cut several miles of ditch, erected flumes and built a reservoir, and is about ready for operations. The owners are confident that they have a good property. They have ample means to equip the mine properly. Dams to restrain debris and to store gold-bearing cement will be constructed.

The Gruss mine, in Genessee valley, is running steadily, with a good force of men, and the presumption is that the yield of gold is quite satisfactory.

The Centennial quartz mine, in the same locality, recently purchased by a syndicate of Nevada people, is being put in shape for active operations next spring. The mill will be equipped with concentrators, thus improving its gold-saving facilities.

At the Lucky S twelve men are reported to be at work developing the mine and putting machinery in place. That important developments will be made there is confidently believed. The mine has produced some very rich ore.

The important developments in the Pilot Peak mine, near Onion valley, justify the belief that one of the feeders of the rich placers worked in that vicinity in the early days has been found, and that the corporation recently formed will be rewarded for the outlay necessary to make for proper development work. The ore is reported to be extremely rich. The Turner brothers and M. E. Sanborn are among the lucky owners.

The Electric Search Light in Shaft Sinking.

Mr. James Baird, in the course of a paper read before the Mining Institute of Scotland, said that the electric search light has been used to great advantage in shaft sinking at the Walkinshaw colliery, near Palsley, Scotland. The apparatus consists of an arc lamp, a lens and a mirror, the whole inclosed in a sheet-iron case 20 in. by 20 in. by 5 ft., having a sliding shutter on each side to give access to the lamp. The adjustment of the lamp is effected by a screw on the top of the case. As occasion requires it can be adjusted to diffuse light throughout the whole shaft, or be concentrated at the bottom, where the men are working. The mirror is hung on its center, and can be moved in a vertical direction, so as to deflect the rays of the light to where wanted, after which it is held in position by a thumb screw. The illuminating power of this lamp is equal to between 4000 and 5000 candles. The dynamo is an Elwell-Parker continuous current, compound-wound machine, running at a speed of 1340 revolutions per minute, and having an electromotive force of 65 volts, and a current of 20 amperes, which is equal to about 2-horse power.

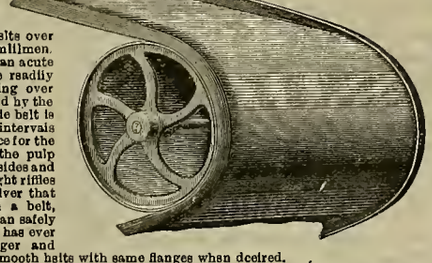
The shaft at Walkinshaw is circular, 13 ft. in diameter, and 260 ft. deep. It is lined with brick all the way, and is free from all buntons, except those necessary for carrying down brattice boards for ventilating purposes. The shaft, therefore, was favorable for this form of light, and so bright and clear did it illuminate the shaft bottom that it had the appearance as if the sun was shining on it. In the case of an oblong shaft with, say, two midwalls, the light would not give the same satisfactory results, but this could be remedied by having two lamps; and in the event of a deeper shaft being required than the one in question, a more powerful lamp could be used, although it is believed that the one employed at Walkinshaw would answer to a depth of 1200 feet.

From experience the following advantages were found with the electric light: 1. The light at the shaft bottom was far in excess of that from the ordinary sinker's lamps, consequently more work could be performed in a given time. 2. The lamp, being stationed on the surface, could be got at easily at any time for adjustment without inconvenience to the sinkers; and in the event of the strata giving off fire-damp, it would give perfect immunity from danger of explosion. By the aid of the light those in charge could see from the surface what was going on below, and this is an important matter.

While the light has great advantages, it is not, however, without its drawbacks, and not the least is its inability to pierce fog and the smoke from shot firing. With good ventilation the latter can very soon be cleared off; when fogs happen, provision would have to be made to use the ordinary hand lamps.

THE outlook in the Kootenay district, B. C., is declared to be encouraging, even if silver is very low. There is considerable activity in silver-mining properties. In one mine—Number One, at Ainsworth—a fine body of ore has just been exposed. It is a dry silver proposition, very high grade. Some of it is said to run 350 ounces, and the carbonates average 100 ounces. From 1000 to 1500 feet of development work has been done and 62 tons of ore have been shipped, the average returns showing 150 ounces in silver to the ton. At Kaslo, in the Slocan district, the outlook is more encouraging than for some time. Two or three months ago the town, after a very active period, was suddenly deserted, owing to the break in silver. Now, however, the town is again filling up, and much ore is arriving down from the mines.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flange or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill supplies.

Mechanical Progress.

Waste Heat Energy Utilized.

Eustace F. Piers, of London, has patented an invention the object of which is to utilize tbe beat energy remaining in the products of combustion after the piston of a gas engine has performed its power stroke. To attain this object a second cylinder, of larger capacity than the power cylinder, is added to the gas engine; and the two cylinders are connected to cranks upon the crank-shaft removed from each otber by about 180°; so that when the power piston is making its outstroke the otber piston is making its instroke, and vice versa. Assume a compressed charge in the power cylioder; this charge is ignited, and the power piston makes an outstroke; at the same time the second piston makes an instroke in its cylinder, compressing air drawn in through a valve by tbe precediog outstroke; as tbis proceeds the pressure in the power cylinder decreases, wbile that in the subsidiary cylinder increases, until the valve controlling the passage between the two opens, and the air rushes into the power cylinder; here it mixes with the bot products of combustion and expands; the return stroke of the power piston forces the mixture of products and hot air into the subsidiary cylinder, where they do work in assisting the outstroke of the suhsidiary piston. The next outstroke of tbe power piston draws in a new charge, while the instroke of the subsidiary pistnn exhausts.

Nine Hnndred and Ninety-Nine.

So much interest has been expressed by the public in the famous locomotive, No. 999, which covered a mile in 32 seconds, that the New York Central has issued the following technical description:

Cylinders	19 inches by 24 inches.
Diameter of driving wheels outside of tires	86 inches.
Diameter of engine truck wheels	40 inches.
Springs, length of driver, center to center of bangers	44 inches.
Total length of boiler	26 feet 4⅛ inches.
Diameter of first ring outside	58 inches.
Size of fire-box	105¾ inches by 40¾ inches.
Tubes, 268	2 inches diameter, 12 feet long.
Heating surface in tubes	1697.45 square feet.
Heating surface in fire-box	232.92 square feet.
Total heating surface	1930.37 square feet.
Grate surface	30.7 square feet.
Stack, inside diameter,	15¼ inches.
Weigbt in working order	124,000 pounds.
Weignt on drivers	85,000 pounds.
Driving-wheel bsse	8 feet 6 inches.
Weight of tender, loaded	80,000 pounds.
Total weigbt of engine and tender	204,000 pounds.
Extreme length of engine	89 feet 6¾ inches.
Extreme hight from top of rails to top of stack	14 feet 10 inches.

Fuel used, bituminous coal.

Sustaining Power of Ball Bearings.

At the discussion on the loads permissible on ball and roller bearings, at a recent meeting of the Engineers' Club of Philadelphia, Wilfred Lewis stated that a manufacturer informed him that almost nothing was known on the suhject. Some crude experiments with three-eighths inch balls showed them to have an ultimate strength of 2000 pounds, and a safe working limit of 400 pounds; though when used in car journals, in which tbe motion was continuous and rapid, it was better not to exceed 200 pounds. Wbether a tbree-fourths-inch ball would carry twice or four times as much as a three-eighths-inch ball was not known, but there was an impression that over a given extent of surface more load could be carried on small balls than on large ones. The effect of hardening was believed to increase tenfold the carrying capacity of a ball bearing.

Early Wire Drawing.

In a paper read at the British Iron and Steel Institute meeting, Mr. J. P. Bedson stated that the wire-drawing trade was started in England by four families who went there from Germany, and they first hammered (called "tilting") the charcoal iron into ¼-inch square rods, which afterward they drew through draw-plates, but not on tn blocks. This was effected by means of a long pole, which had a reciprocatlng motion, actuated by a water wheel, and in this way worked backward and forward. In the forward stroke it drew the rod and wire through the plate and on its return stroke, both of which were very slow, the workman sat and coiled up the length drawn by hand into a ring, and thus continued until tbe whole piece was drawn. The annealing was done in a kiln or brick oven, where the wire was heated to redness and allowed to cool naturally. This formed a lot of scale, which had to be removed by hammering, and then scoured in a barrel filled with wire and gravel and caused to rotate by water power, half immersed in water, for about 12 hours, when the wire was taken out, coated with flour lees, and ready for drawing on.

For Cooling Condensed Water.

A new arrangement for cooling condensed water has been invented in England. After the water has passed in the ordinary way from the condenser to a receiving tank, it is carried through a series of specially arranged coils, which are exposed to the atmosphere, and in its passage undergoes a process of purification and cooling until it ultimately falls into another receptacle called tbe "reserve tank," in an absolutely renewed condition. This water, which, it may be observed, had already been used in the boiler, is then again available for feed and condensation. It will be seen that by this arrangement, owners of wolks will obtain perfect security against the necessity of discontinuing operations through any temporary failure of the water supply, as a given quantity of water may be used any number of times, requiring only such replenishment as will make up for the small losses resulting from leakage and the elimination of impurities. This is what the inventor describes as the "dry process," as distinguished from the "wet process," for cooling condensed water. The inventor claims that if the "Proell cut-off gear" is used for the engine in connection with this system, the saving of fuel will be fully 35 per cent, while the water required for steam-producing purposes will, after the acquisition of the first supply, be an inappreciable quantity.

Blacking for Sheet Iron.

The simplest metbod to blacken iron, says an exchange, is to heat with oil, especially linseed oil. The objects are first rubbed or painted with oil and then heated to such an extent that the oil is burned off. The surface produced in tbis manner is coal black and gives the objects a black coloring which will withstand the highest temperature. After the application is thoroughly dried the objects can he rubbed with benzine or a solution of soda.

In order to procure a black asphalt lac for iron, melt eight pounds of asphalt in an iron kettle, gradually adding 12 pints of cooked linseed oil, one pound of litharge and a half pound of sulpbate of zinc. The whole mixture should be allowed to boil for three hours. Finally, one and one-half pounds of black amber is to be added and the mixture carefully boiled for two hours longer. It is advisable, previous to using this mixture, to thin it somewhat by the addition of oil of turpentine.

Mattresses for River-Bed Protection.

One of the most interesting novelties in the construction of the great Memphis bridge across the Mississippi, at Cairo, was the use of mattresses to protect the river bed from scour under the pier sites. These mattresses were woven from willow witbes and wire. They were 400 feet long by 240 feet wide, and were sunk by loading them with stone. Wben in place they completely protected the river bottom from scour, and enabled the pier caissons to be handled and sunk without difficulty. Each nf the mattresses contained 1000 cords of brush and poles, 900 tons of stone, and 10,000 pounds of wire.

To Prevent Rear-End Collisions.

A device to prevent railroad collisions is described by the Chicago *Journal of Commerce*. The invention requires a small electric-lighting system at dangerons curves. By a piece of mechanism placed at a certain point beside the tracks, the wheels of the train in striking it would pump air into a reservoir cylinder. The air would be forced through a tube to an electric arrangement and force hack a float resting on mercury in a circular tube. The displacement of the float would allow an electric-lighting circuit to be established and electric lights of the incandescent pattern would flare up within a certain distance before and behind the train. The lights would remain burning for a length of time (to be arranged by mecbanism at the air reservoirs) till the air had again escaped from the cylinders. Then the mercury would fall into its natural level in the round tube, the float would rise to its old piace, and, interrupting the electrical circuit, would let the lights go out. The time that they should remain lighted could be made to last from five to ten or more minutes after the train had passed, and thus allow the engineer of a train following it to be aware of the proximity of bis predecessor's position.

The Dawson Steel Process.

A great many new steel processes have been reported lately. One of the most recent is the Dawson process, which is said to have been tried in Cincinnati. In this process the inventor takes scrap iron or steel and treats it with a combination of chemicals while in a state of fusion in an ordinary crucible. When melted the liquid metal is cast in sand in any desired shape, the result being, we are told, the highest grade nf steel. The rolling manipulations are entirely omitted and it is found that the product has combined carhon, but in quantities so small that it would be utterly valueless under the old process.

Scientific Progress.

The Origin of Petroleum.

The following is from a lecture by William Anderson, D. C. L., F. R. S., etc., delivered recently before the Institntion of Civil Engineers, London:

Mendeleeff's theory is that petroleum is the product of the action of water on the carbides of metals at high temperatures at no very great relative depths in the crust of the earth, that this production is continually in progress, and that deposits thus actually forming may be reached in many places by sufficiently deep borings. It is somewhat humiliating when thus drawing attention to the recent rapid advance of science, and to the manner in which the engineer has adapted the discoveries of the abstract investigator to the use and convenience of man, to be obliged to confess how utterly significant are human operations with reference to the size of our planet. The deepest mine is a mere scratch on its surface, so that though the theory of Mendeleeff may he true, the question arises whether tbere be any hope that the wealth inferred to exist may be ever realized, whether the powers of the engineer will ever be so exalted as to enable him to reach those stores of combustibles which that theory supposes must exist in many localities, especially in those where the surface has heen shaken hy primeval convulsinns, and where the deposits may, therefore, he expected to lie at relatively short distances below the surface. In view of recent progress in mechanical skill, it certainly would be rash to say that borings of immensely greater deptb than any that we are as yet acquainted with will never be made, for if accumulated evidence as to the correctness of Mendeleeff's views, together with the ever-increasing cost of fuel, shall bold out hopes of success, enterprising men will be found ready to emhark their means in undertakings, the risk of which would not seem to he more formidable than those which surrounded the laying of the first Atlantic telegraph cable, and the rewards of success in which would be incomparably greater.

Separation of Iron and Alumina.

Dr. Borntrager gives an account of a metbod of separating iron and alumina in chemical determinations in the *Zeitschrift fur Analytische Chemie*. According to this method, the hydroxides are precipitated together, ignited and weighed as oxides. They are then redissolved in hydrochloric acid and made nearly neutral with potash lye, and then they are both preclpitated with neutral liquid potash soap. The precipitation must be effected in heat, and care must be taken against an excess of soap, or else the oleates will be otherwise redissolved. The resultant precipitate is filtered through a filter moistened with hot water and washed with hot water until the potassium chloride is removed. The filter is then partially dried over calcium chloride until the bulk of the water is removed. The gelatinous mass is then treated with hot petroleum until it runs off colorless, and consequently all the iron oleate has passed into solution. The filter is burnt and the residual porous snow-white alumina is weighed. As a precaution and check, the petroleum solution should be burnt and incinerated and the iron oxide weighed. Ferrous oxide may be separated from alumina in this manner without previous oxidation.

When Coal is Dangerous.

A thorough and scientific examination made by an English chemist on the effect of air and ventiiation on coal gives the follnwing results: First, the danger of spontaneous firing of coal in large lumps is very slight, but is much greater with smaller coal, and greater still with dust, the increase of danger being due to the larger extent of surface exposed to the air in proportion to the mass of tbe coal; second, air-dried coal which contains more than three per cent of moisture is dangerous, but if it contains less the danger diminishes, the moisture contained being a measure of the absorbent power of the coal for air, and the more absorbent the coal, the more dangerous; third, the danger is somewhat increased hy the presence of pyrites in large quantity; fourth, newly-won coal should be shielded from the air as much as possible to prevent chance of rapid heating, and for the same reason it is best not to stack it in large heaps, since these retain the heat; fifth, all external sources of heat, such as steam pipes, boilers and hot flues, in tbe neighborhood of coal, add very greatly to the risk, spontaneous heating becoming vastly more rapid when it is assisted from without. Of course these conclusions bave special relation to coal that is stored or shipped in cargoes.

Lithocarbon.

Litbocarbon, wbich is a mineral somewhat resembling asphalt, is the most remarkable mineral of its class known, says *Iron*. It is claimed that it makes a perfect insulator; that as a paint it will resist heat or gases of any kind; that it is capable nf being rolled into a tissue free from odor, and practically indestructible when employed in the prodnction of mackintoshes, canvas belting, waterproof tents, etc. It possesses peculiar powers, enabling it to enter and fill the pores of iron

and steel, reoderlog these metals impervious to acids, etc. It is also said to make common leather waterproof, and it can he applied to wood pnlp for the transformatioo of that material into what looks like ehony or horn. The satnration of a sbip's plates with hot lithocarbon frustrates the attack of baroacles, and the plates will oeither rust nor fonl. A portion of the smokestack of the steamer Dean Richmond, where the heat, through the nse of a hlower rises to 800° F., was painted with lithocarbon several months ago, and remaios uodisturbed and unblistered, while other parts of the vessel have oecessarily heen painted many times. A piece of sheet iron covered with lithocarbon japan is stated to have been subjected to an actual heat of 415° F. without crack or blister, and remaioed so tenacious that the iron could be bent at any angle without disturbing the glossy surface. For varnishing railway and private carriages, painting lron hridges, roofs, steamships, houses, etc., this material acts as an lnsulator, and it is reported that it will neither crack nor blister under any koown atmospheric temperature. At great heat, lithocarhon will soften, hut it will not take fire at any point.

The Tonnage of Vessels.

The generally-accepted rule for calculatiog the tonnage of vessels is known as the Morrisoo system. The system was adopted by an international commissloo at Constantinople in 1873, and was approved by 16 different nations, including the Uoited States. The system is described hy the New York *Sun* as follows:

Measure the internal capacity in cubical consents under decks, and divide it hy 100, making allowance for space occnpied by machioery, crew and stores, beginniog to measure from forward. Thls measurement must be taken in sections ahout 12 feet apart under each deck. A ton is counted in the result for every 100 cubic feet. There is some difference in allowing for engine-room space io different countries. What is known as gross tonnage lncludes space occupied by machinery and crew in the calcnlation. Ship-carpenter's tonnage is worked ont as follows:

For the length, measure from the apron to the stern timber at the upper deck; for the hreadth, take the height from the ceiling to the upper deck. Mnltiply these factors and divide the product by 100, and take three-fourths of the quotient for the tonnage sought. The American Shipmasters' Association publishes annually a record of American shipping, whicb contains precise rules and examples for calculating tonnage, and for building and classing vessels. The United States Government has a rule known as the cnstom-house measurement for obtaining tonnage, whicb will he furnished on application to any custom house.

The Longest Ocean Cable.

The longest ocean cable in the world is that of the Eastern Telegraph Company, whose system extends from England to India and measures 21,000 miles, says *Kate Field's Washington*. Africa is now completely encircled by suhmarine cables, which make up altogether a leogth of 17,000 miles. There are 11 cahles across the Nortb Atlantic, though not all of them are at present in use. Five companies control the lioes of telegraphic commnnicatlon between this country and Europe.

Light Rays in the Sea.

The depth to which the sun's rays penetrate water has heen recently determined by the aid of photography, says the *Scientific American*. It has been found that a depth of 553 feet tbe darkness was to all intents and purposes the same as that on a clear but moonless night. Sensitized plates exposed at this depth for a considerable length of time gave no evidence of light action.

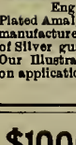
JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

$1000 WORTH OF LAW
FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.
Address THE DEWEY PUBLISHING CO.,

Electricity.

Where Accumulators are Practicable.

In spite of the slow introduction of accumulators in this country, there are a great many uses to which they might be profitably put that have been pointed out to us by the practice in France and Germany, where they are in extensive use. They are considered indispensable in many of the largest central stations in those countries, although here no attempt has been made to introduce them for this work, says the Chicago *Journal of Commerce.*

It is pretty well settled that an efficient battery, whose depreciation is not too rapid, adds considerably to the economy of a central station by evening the output of the steam plant through the day.

In every station the load line is very variable; during the greater part of the day it runs fairly even at a small amount, and toward night increases abruptly to a maximum which lasts only two or three hours, and then falls off to almost nothing later in the night. This is true of almost every incandescent lighting station, and accumulotors are admirably adapted to carry the load at the times when the engines are running almost empty. By charging the batteries during the day, the load on the engines is increased to an amonnt at which they run with a higher efficiency, and the stored current may be used to carry the night load and the plant shut down. It may also be used to supplement the dynamos during the hours of heavlest load, and in this way the maximum output of a station may be made considerably greater than the capacity of its steam plant.

The use of accumulator substations has been found advantageous in a nnmber of places, and they are often used in the capacity of transformers to utilize a high-tenslon current by which they are charged during the daytime for an incandescent lighting circuit in the evening. This plan is adopted in the Papp stations in Paris, where 54 stations are all charged in series, each station having two sets of batteries, one of which is discharged while the other is being charged.

In railway work there have been a few experiments with battery cars in this country, bnt the great number of nnreliable batteries on the market, and the uncertain legal status of many of them, have been sufficient to check great progress in this direction. That storage batteries are entirely feasible for street railway work is shown by their success in Paris, where one company operating about 40 cars has found them entirely satisfactory after a test of two years' service.

Accumulators have also been found of service on trolley lines for some purposes. In Dover, N. H., the attempt was made to feed the trolley line on a steep grade some distance from the power-house with batteries, in order to run this section at a higher voltage than the rest of the line, and the plan appears to be entirely feasible. Charging batteries during the time of light load on street railway circuits for the distribution of power has also been favorably considered, and there are besides a great number of applications for which the storage battery is specially adapted. These applications are now no longer a matter of experiment, as the value of the storage battery has been thoroughly established abroad, and the absence of any progress here in this direction is invariably remarked by our foreign visitors.

To Utilize the Great Waterfall.

Quite a number of manufacturing enterprises throughout Pennsylvania and New York will move their plants in order to secure power from the Niagara Falls Power Company. This great scheme for utilizing the water power at Niagara Falls and transmitting it electrically to points some miles distant, is reported to be nearing completion. The company has taken a great number of contracts to furnish power for different plants. Various sections of the country will suffer the loss of plants projected or already in operation, as many such will be removed to points near the falls, but the general feeling seems to be that, on the whole, the benefits afforded by the enterprise will quite outweigh all such local disadvantages.

The plant which the Cataract Construction Company will put in is thus described: The system adopted is the two-phase alternating current Tesla system. After a careful stndy of the conditions under which the apparatns had to operate, the engineers of the Cataract Construction Company prepared a complete set of specifications calling for the employment of the two-phase system.

The apparatus will be built in units of 5000-horse power. The revolving field of the generator will be constructed with inwardly projecting poles and will revolve in a horizontal plane, being mounted upon the vertical shaft of the turbine.

The weight of the shaft, tnrbines and armature is to be carried by the upward pressure of the water columns producing the heads for the turbines. The electromotive force generated will be 2000 to 2400 volts and will be increased by step-up transformers for long-distance transmission and lowered by reducing transformers for distribution. The motors will be the two-phase Tesla motors which have been found to be well adapted for power pnrposes. The system adapts itself readlly to the use of motor generators or rotary transformers, so that it is possible to develop elther single-phase alternating currents or continuous currents of any desired electromotive force as may be required for the use of individnal customers. It is expected that a large amount of power will be employed for manufacturing purposes, arc and incandescent lighting, electrolytic work and power purposes generally. It is also understood that the company contemplates sending current at high electromotive forces to Buffalo and greater distances, to be used for lighting and power purposes. The work upon the apparatus has already been begnn, and it will be installed at the earliest possible date.

Electrolysis of Gas and Water Pipes.

Electrolytic action by the current from trolley tramways on the gas and water pipes appears to give some reason for uneasiness in America. It is reported that in Illinois an overhead line became gronnded through one of the iron poles carrying the span wires. The base of this was in contact with an abandoned cast-iron pipe, both being somewhat rusted. In crossing, an arc was formed which practically welded the two together. The current is said to have followed the old pipes 100 yards, where the cast-iron pipe enconntered a wrought-iron natural gas main. The pipes were melted and an opening formed so that the gas entered the old pipe, which followed the base of the iron pole. Here it caught light and issued at the top in a flame 15 feet high, quickly interrupting the traffic and melting the trolley lines.

A Definition of Electricity.

Prof. Galileo Ferraris, the genial Italian scientist, whose name is well known to all electricians, was recently asked by a young lady what electricity was, but, unlike most others when asked that qnestion, he ventured to answer it, and according to *Cosmos*, wrote in French in her autograph book the following, of which we venture to give a translation, even though the English language hardly does justice to the original French: "Maxwell has demonstrated that luminous vibrations can be nothing else than periodic verlations of electro-magnetic forces. Hertz, in proving by experiments that electromagnetic oscillations are propagated like light, has given an experimental basis to the theory of Maxwell. This gave birth to the idea that the luminiferous ether and the seat of electric and magnetic force are one and the same thing.

"This being established, I can now, my my dear young lady, reply to the question that you put to me: What is electricity?

"It is not only the formidable agent which now and then shatters and tears the atmosphere, terrifying you with its crash of thunder, but it is also the life-giving agent which sends from heaven to earth, with the light and the heat, the magic of colors and the breath of life. It is that which makes your heart heat to the palpitations of the outside world, it is that which has the power to transmit to your soul the enchantment of a look and the grace of a smile."

Manganine for Coils.

On account of its high specific resistance and small negative temperature-coefficient, manganine, composed of copper, 83 per cent; nickel, 4 per cent; and manganese, 13 per cent, is stated by a German physician to be especially vainable in the manufacture of resistant colls. He found that after such a coil had been heated to about 212° F., its resistance was diminished by from 0·4 to 0 8 per cent; but on repeating the process the alteration became less and less, until it amounted to no more than 1·20,000 of the whole. He recommends, therefore, that the coils should be heated to 225° and kept at that temperature for some hours every month, in order to get rid of the molecular disturbances due to the processes of manufacture, and that they should be well paraffined to preserve the alloy from air and moisture.

The Poor Man's Light.

Electricity will eventually provide the poor man's light, Mr. Preece is reported to have said, and we think it is a reasonable prophecy, says *Invention.* The management and control of the electric motor is simple, its service is in direct and immediate command, it requires no fuel, in economy of space occupied has no competitor, and in some cases, where needed for intermittent use, power can be furnished at one-tenth to one-fifth the cost of steam. An American contemporary points out that the electric motor has found its way into plumbing, metal spinning and machine shops in New York, and considers that there can he no grave doubt as to its more general adoption.

Useful Information.

Horses Should Wear Light Shoes.

Horses are commonly made to carry too heavy shoes. The shoe is designed merely to protect the hoof, and the lighter it can be made and still serve its purpose, the better for the horse, says the *American Agriculturist.* Horses that are devoted to farm work, and on land where there are few or no stones, may dispense with shoes, except while the ground is frozen. This would be of great advantage to the horse, to say nothing of the saving in the horseshoer's bill. But most horses require shoeing, and the shoes worn are heavy iron ones. Steel shoes can be made lighter, will wear longer, and the first cost is not so much more that it need prevent their being used. Light horses and driving horses should always use them. For horses of 1100 pounds weight, and with well-shaped upright feet, the fore shoes should weigh about one pound each, and the hind ones 12 ounces. If four ounces are added to each shoe, let us see what a difference it will make. In plowing, cultivating, mowing, reaping and many other farm operations, a horse will walk from 10 to 20 miles a day, and advance about four feet at each step. At each step the horse lifts half a pound extra on its two feet, or 666 pounds in every mile. In a day's work of 15 miles, the horse would lift 9900 pounds extra, or nearly five tons. If the force required to lift this five tons of iron could be expended in the work the horse is doing, much more could be accomplished. In the light of these facts, is it any wonder that when young horses begin to wear shoes they soon become leg weary, have their step shortened and acquire a slower walking gait?

Cutting and Polishing Gems.

In the cutting and polishing of gems generally, the artificer is provided with a small mill the arrangement of which is such as to enable him to keep a flat plate rotating in a horizontal direction, says *Work.* The upper surface of the mill-plate is that on which the grinding of the gem is conducted, and the plate is, therefore, formed of material adapted to the kind of gem. The diamond requires a mill-plate of steel. Gems of the next degree of hardness, such as the sapphires and ruby, require a mill-plate of copper. Somewhat softer gems, such as the beryl, topaz, amethyst, garnet and hyacinth, require a leaden mill-plate. The softest kinds, such as quartz, opal, and artificial gems, require a mill-plate of wood. These distinctions arise from the circumstance that the mill-plate for grinding each gem must be proportional in hardness to, but not so hard as, the gem to be ground. The gem to be ground is cemented to one end of a small rod, and the artificer, having the means of giving a rapid rotatory motion to the mill-plate, applies the gem to it, and grinds away the substance of the gem according to the kind of effect required to be produced. For grinding diamonds, sapphires and rubies, the mill-plate is touched with a little diamond powder and oil to give the requisite abrading power; for emeralds, beryls, topazes, garnets, hyacinths, and all the softer gems, emery and water are applied to the plate. The grinding wears away the surface of the gem in various parts but the new surface thus produced is dull. To impart lustre the gem is polished on softer mill-plates with tripoli powder and water.

A Pumice Stone Mine.

A mine of pumice stone exists on the Teneriffe peak, of which the working was only started in 1888, says the *Manufacturers' Gazette.* The stone is found in that part of the peak called the "Canadas," at about 2000 feet above sea level, which as an area of some 6000 hectares, out of the middle of which rises the highest part of the peak. The Russian consul at St. Croix bought this property from the Spanish Government in consideration of an annual payment for the pumice stone working. The Russian consul has associated himself with a Belgian, and they, under the firm styled Aguilar & Valcke, commenced operations in 1888, but it was only last year that exportation was really started. At the Paris Exhibition, the consul-general states, this stone obtained a silver medal, and in view of the requirements of England, France and America, he believes it will develop a trade of great importance before many years. So far the Lipari islands have practically furnished the world's supply of this product, exporting about 100,000 tons per annum. The Teneriffe stone, being recognized as of excellent quality, and its extraction being of a much more simple matter than in the Lipari islands, it follows that the price is much less.

The Corinth Canal.

The Corinth canal, says U. S. Consul George Horton of Athens, will abridge by 185 nautical miles the route of vessels bound from the Adriatic to Constantinople, and will save 95 miles in the case of vessels bound from Mediterranean ports. As before stated in these columns the canal was commenced

in 1881 under a concession granted to Gen. Turr by the Greek government; hut the original company having failed another was formed wlth French capital and the canal was officially opened on Aug. 6, 1893. The present company has a capltal of 5,000,000 francs. It is estimated that the annual traffic througb the canal will amonnt to 4,500,000 tons, paying 1 franc from the Adrlatic and ½ franc from elsewhere. One franc will he charged for each person on a passing ship. The company's lease is for 99 years, and at the expiration of this time the canal becomes the property of the government on the payment of 5,000,000 francs to the company. The canal itself is 21,441 feet long, 68.9 feet wide at the hottom and 70.8 feet wide at tbe surface and 26.24 feet deep.

American Manufacture of Alkali.

The greatest difficulty encountered in alkali manufactnre in this conntry is that of temperature, the extreme cold in winter and the great beat in summer, says an excbange. In order to overcome the troubles caused by excessively varying temperature, a large factory whicb is now being constructed in Virginia will be built in a huge excavation in the side of a mountain, and here the bleach chambers will he erected. Tbe property is nnderlaid by a fine deposit of rock salt, and has a surface of excellent limestone. There is plenty of good timber, and not distant coal fields will supply fnel at cheap rates.

The methods of alkali manufacture hitherto in vogue bave been tedious, crude and expensive, and tbe introduction of electricity into the industry opens out new and remarkable possibilities. The electrolytic process of the decomposition of common salt by electrolysis, is the only direct means of producing by one operation caustic soda and chlorine gas.

The value of this process can he seen by comparing its results with those of the old methods. By one standard process 18 cwt. of salt will give one ton of salt cake, but it requires two tons of salt cake to yield one ton of caustic, and therefore 30 cwt. of salt is required to make one ton of caustic and 16 cwt. of hleaching powder. By electrolysis it is calculated that 36 cwt. of salt will yield one ton 16 cwt. of caustic soda and two tons six cwt. of hleach.

Work a Horse Will Do.

A horse will travel 400 yards in 4½ minutes at a walk; 400 yards in two minntes at a trot; 400 yards in one minute at a gallop, says an exchange. Tbe nsual work of a horse is taken at 22,500 pounds raised one foot per minute for eight hours per day. A horse will carry 250 pounds 25 miles per day of eight hours. An average draught horse will draw 1600 pounds 23 miles per day on a level road, weigbt of wagon included. Tbe average weight of a borse is 1000 pounds, and his strengtb is equivalent to that of five men. The greatest amount a horse can pull in a horizontal line is 900 pounds, hut he can only do this momentarily; in continued exertion prohably half of this is the limit. He attains his growth in five years, will live 25, average 16 years. A horse will live 25 days on water without food, 17 days without eating or drinkIng, but only five days on solid food without drinking.

A Loud-Sounding Telephone.

An Englishman is credited with the invention of a telephone which will talk loud enough for a person in any part of a large room to hear and nnderstand what is said. This is accomplished not so mucb by an improvement on the existing telephones, as by the method of arranging the circuit and bringing its resistance as low as possible. For this purpose the usual induction coil is discarded, and the two instruments, transmitter and receiver, are directly connected in circuit witb tbe line and the battery.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Notes.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

PRACTICAL TREATISE ON HYDRAULIC MINING.
By AUG. J. ROWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdye, rockers, undercurrente, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

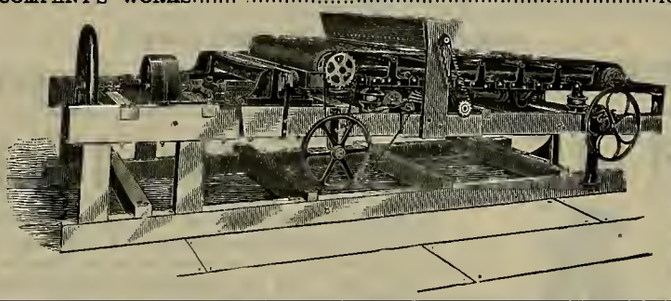
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.
The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

MINE BELL SIGNALS
ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

The Sierra Buttes Company's Mines.

The Sierra Buttes Mining Company (English) which has for many years been operating the Sierra Buttes and Plumas Eureka mines in Plumas county, and which now owns the Uncle Sam in Shasta, seems to have made a fortunate purchase in the latter. The stockholders held a meeting in London last month and heard the report of the Chairman, Mr. Frederick Tendron, and the directors. The profit made by the Sierra Buttes for the preceding half year was $4500; in Plumas Eureka, $9000; Uncle Sam, $45,000. The profit in Sierra Buttes was realized from ore in pillars and in parts that had not been considered of sufficient value to work years ago. The working of this old ore has now gone on three years and it is hoped to be able to continue for some time yet.

In the Plumas Eureka the ore is of exceedingly poor quality, but the supply is abundant, and it is possible to realize a profit. Whether it will continue is exceedingly doubtful. But a discovery is hoped for. But it is the Uncle Sam which has made a fine showing. Says the Chairman in part: "The total crushed since we took over Uncle Sam has been 58,636 tons, and the gold taken from the ore amounted to nearly $600,000, and there was a profit on that of nearly $250,000. The average value of the ore for the whole period (much the best way of dealing with it) has been $9.50 a ton, and the net profit $4, showing the working cost, including the London expenses and everything, to be $5.50. The average for the past half year has kept up higher than we could have expected. It has been $9.20 a ton, and the working cost has been reduced to $4.85. What we look forward to is chiefly the reduction in the working cost by putting up a Huntington pan to crush some of the poorer ores, for the essential thing is to make the mine last as long as we can and get a good profit out of it the whole time. When you consider that the Uncle Sam was bought for $150,000, and after spending $60,000 on buildings, mills, chlorination works and development, you have had in dividends and reserve $240,000, you certainly have no reason to regret the purchase of Uncle Sam. (Cheers.) When in addition to that I tell you, that, as far as they can judge out there they have at least six years' ore in sight of the same quality as that which in less than four years has given us $240,000 profit, you must all be very anxious that they should find us another Uncle Sam.

"In the western part of the mine Capt. James and Mr. Johns estimate that we have at least 100,000 tons of ore. Now, as we know the quality of the ore from past experience in various parts of the workings I do not think they are at all exaggerating, either as regards quantity or value. In the eastern parts of the mine they also tell us that upward, in two shoots, they have nearly the same quantity of ore as they have worked out during the last few years. Consequently you may take it that we have more than three years' supply, because we have not only the unworked portion of the stopes to surface, but another body of ore some distance farther on, which they have only passed through for 100 feet, and they tell us they have not worked there, because they have no place to dump the stuff conveniently as they take it out. Now, whenever they do not work a body of ore I am suspicious that it is on account of its poor quality, and I am so in this instance. They only went through 100 feet on the third shoot, but there is a certain quantity there, and there are croppings that would justify us in thinking that it makes up to the surface. In the two shoots at the No. 2 level we have an ore body something like 500 feet long. When we go down to the 2½-foot level the shoot is only 130 feet long, and another is only 25 feet, but when we go another 220 feet lower, the ore they have laid open there is something like 25 feet. Here comes an important question to which I have often referred as to the making down of these reefs. I remember perfectly well when I was out there many years ago, Mr. Johns showing me a shoot that was going down from seven to eight feet wide in the Buttes mine, the pay part of which had suddenly jumped away from them. They had gone down in a winze and missed it, and yet it was only a few feet from where they had sunk. In the Eureka mine for years they were within a few feet of the famous Treznna shoot, which gave $330,000 profit. I do not believe they are in the right fissure to find this shoot in depth. I do not believe the shoots have died out, but that there is another fissure. If you look at the ground plan you will see that, instead of the vein continuing in a more or less straight line, the center of it is all pushed forward, and there is a cross-course. In all probability that pushing forward of a large mass of the mountain has occurred in depth, and the continuation of the vein from the western to the eastern side like that would be in the forward direction in which it had been pushed. Where they have driven is, on the contrary, nearer the vertical, and my belief is that it will be found a fair distance in a northerly direction from where they have up to the present time driven, and what we shall suggest to Mr. Johns is that from this small body of ore of 25 feet, representing a second eastern shoot, he shall crosscut at right angles to the vein, or as nearly as possible in a northwesterly direction for a considerable distance until he proves clearly that there is or is not another fissure. The expense is small and will only amount to a few hundred pounds, which is nothing, if by such an outlay we lay open a body of ore for years to come; and, if it does not do this, we have simply done our duty as miners in exploring the ground thoroughly. The natural feeling of a mining captain, when he has a large supply of ore already laid open, is to make as big a return as possible, and so he wants a little pressure put upon him from home, to make him really understand that exploratory work is work that should be done in your days of prosperity.

"I may give you these interesting figures as I have done before: We have paid in dividends in the Buttes and Eureka £14,000, and we have for reserve fund for the two mines and first-class securities £2,000."

The stockholders extended a vote of thanks to Mr. Johns, Capt. Jenkins, Capt. James, and to the other officers of the mine here and in London.

The Sierra Buttes company has bonded the Whitlock mine, in Mariposa county, for nine months, and is now engaged in pumping out the water. The purchase price has been agreed upon at $100,000.

Books Received.

We have received for review the following books from Osborn & Alexander, publishers' agents, 401 Market St., San Francisco:

"A Text-Book of Coal Mining, for the Use of Colliery Managers and Others." By Herbert W. Hughs. Chas. Griffin & Co. and J. B. Lippincott, Publishers. Price, $6.

"The Assayers' Guide; or Practical Directions to Assayers, Miners and Smelters." By Oscar M. Lieber. H. C. Baird & Co., Publishers. Price, $1.50.

"Origioal Papers on Dynamo Machinery and Allied Subjects." By Jno. Hopkinson. W. J. Johnston Co. and Whittaker & Co., Publishers. Price, $1.

"Ice-Making Machines." Translated from the French of M. Ledoux. Revised and Transformed to English Units by Denton, Jacobus & Riesenberger. Publishers, D. Van Nostrand Co. Price, 50 cents.

Profusely Illustrated with Plates, Diagrams and Engravings.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Coast Industrial Notes.

—Placer county has a broad-tire ordinance.

—Los Angeles is taking steps to improve the fire-alarm system of the city.

—Ninety-eight cars of beans were shipped last week from southern California.

—The electric street lights of San Bernardino cost that city $5.90 each a month.

—The Petaluma starch factory, after a delay of several months, started up Wednesday.

—The output of Everett, Wash., for the year was: Lumber, 23,300,000 feet; shingles, 92,000,000.

—There is a company at work in Tulare county looking for oil. A shaft has been put down 40 feet.

—The San Diego City Council has voted in favor of city ownership of the electric lighting plant.

—Whatcom county, Wash., will need to raise about $200,000 on its assessed valuation of $12,951,000.

—Work on the Montana Southern railroad is progressing. Eight miles of the road have been graded.

—There is under consideration a plan to have an overhead driveway on the new bridge over the Sacramento river.

—The Huntington-Hopkins Company of this city, which was recently reported to be retiring from business, announces that it has no such intention.

—The Sepulveda Rancho and the Rancho Jurupa, near Riverside, have been sold to the Riverside Sierra Company for $700,000. The ranchos contain 20,000 acres.

—The steamer Idaho, which was sunk in Kootenai lake on the 10th inst., has been raised by wreckers, who purchased her, after she sank, for $350. She cost $30,000.

—The La Punta Salt Works, located on the low land at the head of San Diego bay, has made this year 650 tons of salt, which is a larger production than that of any previous year.

—To protect the striped bass, it is proposed for the supervisors of the various California counties to pass ordinances making it a misdemeanor to take fish weighing less than three pounds.

—A company has been organized to float logs down the Mokelumne river. It is proposed to clean out the channel of the stream, and a 30-years lease is wanted by the company. If successful, this will open up a great timber region.

—Experts claim to have found a shortage of over $1,000,000 in the value of the water plant recently purchased by the city of Tacoma from C. B. Wright of Philadelphia for $1,750,000. The experts place the value of the plant at $740,000.

—C. W. Hinchcliffe, special agent of the Sunset Telephone Company, is at Willows for the purpose of placing a system of telephones in that is entirely new. By this system subscribers will be entirely independent of the local central office.

—At a meeting of the directors of the newly organized Farmers' and Merchants' Bank of Woodland, Yolo county, D. N. Hershey was elected president, C. G. Day, vice-president, and R. H. Beamer cashier. The bank has just completed a three-story frame building.

—The first shipment of the largest purchase of apples ever made in Grant county, Or., arrived in Baker City the other day by eight six-horse freight teams, and other teams are on the way. The entire consignment consists of 8000 boxes. The fruit will be shipped to Denver, Colo.

—Allen C. Mason of Tacoma has given an option on land in the Commencement Bay Addition to a railway, supposed to be the Great Northern, for terminals. It is understood the line will be extended to Tacoma soon. According to the agreement, the road must be in operation by July 1st.

—The Pullman (Wash) Hardware Company has passed into the hands of a receiver. The company asked for a receiver to protect their creditors. D. F. Staley, cashier of the Pullman State Bank; is receiver. The liabilities will aggregate about $30,000, with assets reaching nearly $60,000.

—A lease of 25 freight locomotives from Burham, Willlams & Co., proprietors of the Baldwin Locomotive Works of Philadelphia, to the Atlantic & Pacific Railroad has been filed in the San Bernardino County Recorder's office. The value of each locomotive is $9810. The lease is for a term of two years.

—An engineer corps of the Monterey and Fresno railroad, under charge of Chief Engineer P. P. Dandridge, is about to locate a permanent line through the Coast Range and across the San Joaquin plains to Fresno. The corps expects to reach the latter point in four weeks. This completes the entire permanent location and the road will be put under contract as soon thereafter as practicable.

—The shingle men of Washington and Oregon met at Seattle Wednesday, two-thirds of the mills being represented, and adopted the outline of a plan for organization of the new association, which will control the production and maintain prices. It will have many of the features of a trust. A committee is preparing a constitution. It was decided not to sell any more shingles for shipment or delivery after January 1st until the organization is completed. It is the intention to raise prices.

—The Esquimalt Marine Railway Company of Victoria capitalists, with W. F. Bullen as managing director and $100,000 capital, have begun the construction is Esquimalt harbor of a marine railway for docking and repairing vessels cheaper than by the usual dry-dock methods. Vessels up to 300 feet long and 19 feet in depth will be floated on a cradle, fastened by patent blocking and then pulled up an inclined railway 700 feet long on six tracks by powerful machinery. Shops for repairing machinery and woodwork will be erected, the whole to cost $60,000. The plant will be in readiness for operation in February.

—The Sacramento-street cable road, a part of the Presidio and Ferries Railway system, is to be extended beyond Central avenue to D street and the Midwinter Fair grounds. Surveyors have began work at the Sacramento-street end of the proposed extension and have gone over the right of way from the present terminus of the cable line at Walnut and Sacramento streets, on the latter to First avenue, and thence to Lake street, Sixth avenue, D street and the park and fair ground entrance. The extension runs a little over a mile, and is to be completed and running by the first of the year in time for the opening of the Midwinter Exposition.

—The Government contract for excavating a new mouth to the Yuba river, which has been in progress for three months, is completed, and a portion of the river was turned into the canal, which empties into the Feather river 2600 feet southwest, in which distance there is almost eight feet fall. The work is very satisfactory and indicates that it will be a means of relieving much outside pressure on the levees this winter in the event of high water. Since the water was turned in the Yuba has lowered almost six inches, and the Feather has fallen even more than that, which indicates favorable results in scouring out the Feather river below the mouth of the Yuba, something long desired by orchardists on the river bottoms north of Marysville.

—M. S. Lowenthal estimates the salmon pack for the season of 1893 as follows:

Location.		Cases.
Columbia River		365,700
Rogue River		3,109
Oregon (Fall) estimated		20,000
Alaska (including shipments to Oregon):	Cases.	
Red	471,436	
King	38,731	
Silver	126.953	637,120
British Columbia:		
Fraser River	425,200	
Northern Rivers	123,600	548,800
Fraser River (outside):		
Stockeyes	50,650	
Cohoes	10,500	61,150
Grand Total		1,635,879

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

508,349.—WRITING TABLET—B. W. Scott, San Jose, Cal.

22,869.—DESIGN FOR BOOKHOLDER—W. O. Willl, Sacramento, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

On the Osceola Tunnel.—*Record*, Nov. 9: The contractors on the Osceola tunnel are driving ahead with results satisfactory to themselves at least. Messrs. Tripp and Ross are still prospecting on the Trumpet. Mr. Tripp tells me that he can see free gold in the rock as far as gone and is very much pleased with his prospects.

The Bay State people are pushing the matter of their concrete bulkhead to completion as fast as they can. Superintendent Jones informs me that he hopes to have everything in readiness for the contractors by the 10th instant. Dr. Boyson, a heavy stockholder, visited the mine last week and seemed to be very much pleased with the way the work is carried on.

Butte.

Another New Mill.—Oroville *Mercury*, Nov. 11: J. D. Clemens and Frank Willet of Forbestown have completed the purchase of a ten-stamp quartz mill of Perkins & Wise. The mill was bought for the Bullion Consolidated Quartz Mining Company of Forbestown. This company organized last week with the following officers: Frank Willet, president; J. T. Clemens, treasurer; Chas. Bovear, secretary; John Pellar, foreman; John Crossmen, W. Kendall, Wm. Smitheron and Thos. Stocker, directors.

The company, which is composed of practical miners and mill men, have bonded from L. K. Reesoner his quartz property consisting of four ledges upon which considerable development work has been done. The property was recently under bond to an English company who gave it up because the ledge was not extensive enough to justify the erection of an 80-stamp mill. It was found, however, to be a very rich ledge extensive enough to warrent the building of a small mill. The miners above named consequently secured an option on the mine for $10,000, have bought the mill and expect to have it running within six weeks. It will be run by water power, and they claim to have enough ore in sight to pay for the property in six months.

Calaveras.

Coming to the Front Again.—*Chronicle*, Nov. 11: Messrs. Hevens and Ewing of San Francisco, gentlemen who have been reered in mines, and with an experience that has proven profitable, have been looking about this section, and on Thursday last concluded negotiations for the North Star placer mine, owned by the Messrs. McGuire of Heppy Velley. This property consists of 69 acres, U. S. patent. For the past 30 years Mr. McGuire has been working by drift process on the north end of the claim, using the old-style hand windlass for hoisting dirt and water, and reared a large family from the profits of his work. But as work was prosecuted south, the grade of the channel running that way, water forced him to suspend operations. The new company will proceed at once to put on a first-class hydraulic plant and tear away all this drifted ground, and thus have the face opened as a new mine for drifting purposes. This will cause to be built an extensive flume some 1200 feet in length; 700 feet of pipe will also be laid to convey water from the Mokelumne canal, under a pressure of 200 feet. Lumber and tools will be on hand next Monday to commence fitting up. Charge of the mine is in the hands of C. M. Burleson, Esq., of this place.

The claim formerly worked and owned by Messrs. Starr & Mattison, located in Chili gulch, one mile from this place, will be reopened at once. The mine was formerly worked by an incline shaft, with drift at head 4000 feet long penetrating Stockton hill. After many years' working, the owners closed the mine, sold their machinery, and practically abandoned the property. The company in former years had litigation with the late Jas. Duryea over ten acres of mining ground, which both parties claimed, resulting in a victory for Jas. Duryea.

This property was considered "rich," and located near the foot of their incline. John Jackson, Esq., has been employed to superintend the work. This ten acres of land secured, work will be commenced next Monday for opening the claim.

The Fairchild property, near Glencoe, a hydraulic proposition, shows a fine body of gravel, which is being worked by ground-sluice process by Mr. Fairchild with good results; it will be opened up systematically with a good hydraulic plant. A strong company have concluded arrangements for the purchase of the property, and will, about Dec. 1st, have things moving actively.

The old "Butcher John" mine, a quartz property near the Fairchild mine, is operated by Mr. Tyson of San Francisco. They cleaned out the old shaft, and have a fine steam hoist and pump, have erected good buildings and are taking out some high-grade rock from their deep workings, which, in fact, is of great importance to the miners of this district. Mr. Tyson has secured an eight-stamp mill, which stands about one mile from his mine, and will transport ore for treatment.

Col. Barstow of San Francisco has secured the old New York Flat quartz mine, located between Glencoe and Independence. The record of this mine is O. K.; has a shaft down 300 feet, with two veins running parallel, one of which pays $30 per ton. The mine is to be equipped with modern improved machinery, which is now on the way from San Francisco, some 70 tons being in transit. Electric power will be used, the plant to be located on the Mokelumne river some six miles distant.

All the knowing miners of Glencoe and Railroad Flat district speek highly and with confidence of the New York mine, and we believe that Mr. Berstow will succeed.

The above enterprises are the principal events of the week, yet we have scores of new men looking about for locations, and expect to see many more new enterprises opened up in the near future. We can thank our friend Grover Cleveland for this young boom, if we may so call it, for these parties are largely ex-silver-miners, the first of whom, Havens & Ewing, having been identified with silver-mining for 25 years.

Nevada.

Good Clean-up.—Grass Valley *Telegraph*, Nov. 2: Friday a clean-up from a crushing of 78 loads of rock taken from the Wisconsin ledge was made at Southern's mill and the result was that the rock paid $40 a load.

The mine is being worked by a company of lessees and the lease has 15 months to run yet. Those comprising the company are John Feeney, Teegne Looney, Tim Hurley, Martin Nilon, Thomas Jones, Geo. Murphy, Pat Feeney and Jas. Vivien. The company also employs several men. It was necessary for the company to do considerable dead work before a crushing could be taken out, but wages were made by those interested, and the next crushing will make quite a stake for the company.

The Wisconsin was located in 1854 by Joseph Dewson, who named it after his native State. In 1856 a 9-stamp mill and hoising and pumping machinery were erected, the cost of which was $11,000. A perpendicular shaft was sunk 60 feet the same year, and a drift was run for the ledge and 700 tons of rock taken out which paid $68 per ton. In 1857 the shaft was sunk a depth of 110 feet, and some portions of it cost $100 per foot to sink.

Then the mine became entangled in litigation, and in 1859 E. McLenghlin, Geo. A. Montgomery and Wm. Loutzenheiser became the owners. It is at present owned by the Menlo Company.

Mine Bonded.—Grass Valley *Union*: The Lemerque mine, owned by Capt. S. H. Dille, Wm. Lontzenheiser and Robert Kemp, has been bonded to a company represented by P. P. McAuslend of Nevada City, and this morning work will be commenced by cleaning out the shaft. Very shortly suitable machinery will be placed on the mine. The property adjoins the North Star on the south and the ledge is parallel to that of the North Star. The Lamerque was worked to some extent in the early days and crushings of ore from the mine yielded as high as $70 to the ton.

The Centennial.—*Transcript*: M. Kinzle, superintendent of the Centennial gravel mine, writes to the Virginia City stockholders as follows: "We have nothing of special importance to relate this time, but are busy pushing ahead in our second crosscut, the bedrock showing very favorable. The gravel is about the same, working freer and giving good coarse gold prospects. We shall have it in the top of the crosscut shortly. It is coarser than we found it in the front channel, with plenty of round wash quartz pebbles and bowlders. We have had two days of big rain, but no snow. With plenty of water this winter, old Nevada county will beat all her past records in gold production."

The South Idaho.—*Union*: Drifting was commenced at the South Idaho mine this week from the 140-foot station. In the drift is a ledge varying in size from 18 to 20 inches. It shows some free gold, but is especially valuable for its sulphurets.

Started Up.—*Transcript*, Nov. 9: Tuesday the hoisting works and mill at the German mine, near Washington, were started up. It is the company's intention to rush work ahead as fast as possible. About 25 men are employed now and the force will be increased as work progresses. The mine has been idle some time.

Placer.

Started Up.—*Argus*, Nov. 11: The Mayflower started on full time again on Tuesday last. The company has just finished putting in new mortars and making many other repairs, which practically makes the mill as good as new. It is about eight weeks since these improvements began, and a lay-off had to be given to nearly half the force during that time in consequence.

J. B. Patterson, superintendent of the Golden Rule mine, was up on Monday. The mine is situated in this county directly opposite the famous Zentgraf mine. A late crushing from the outcroppings yielded $15 per ton. Mr. Patterson is pushing the tunnel forward, and will reach the main ledge in a few days. The indications are first-class.

Shasta.

Two Good Strikes.—Redding *Free Press*: Johnny Franck and Johnny Kelly, who purchased the Tom Greene mine on Deadwood, have made a rich strike a few feet from where the former owners ceased work. A four-foot ledge has been uncovered, and the ore will go $100 to the ton in free gold. Mr. Greene took out a great deal of money from this mine, and it is believed that the present owners, who are miners of pluck and experience, will do well. Their predecessors—Joost, Drexel and Mills—could not agree among themselves and gave up the property.

Peter Scherer has again struck it rich on the Old Tellurium. The secretary of the company, Mr. Jones, informs us that the strike is on the hill on the Eureka ground, and that in sinking an incline shaft to crosscut the ledge they ran across a two-and-a-half-foot ledge of free gold. The shaft is down 125 feet.

Sierra.

Promises Well.—Nevada *Transcript*, Nov. 8: The quartz mine recently purchased in Sierra county by ... E. Head and Robert McMurray gives every indication of proving a valuable property. A shaft has been sunk 60 feet, and ledge five feet in width uncovered. The quartz is well filled with sulphurets and shows considerable free gold. The mine is known as the Idaho, and it is thought that it will in time rival its famous namesake in Grass Valley district. It is situated between the Oriental and Rainbow mines, two of the richest quartz properties ever discovered in that part of the country.

In the spring the owners will put up heavy machinery and get ready to work the mine on an extensive scale.

Siskiyou.

All Doing Well.—Yreka *Journal*: All the miners on the Klamath river are now doing good work with excellent success in taking out gold-dust at their several claims, the weather being fine for carrying on mining operations in that stream. The same may be said of miners along Humbug creek and other tributaries of the Klamath throughout the county and in Trinity county adjoining.

The Greenhorn blue gravel mine still continues to yield the usual average pay each day, and will continue the same average of $100 a day until more water is obtainable by winter storms to double that amount in being then able to put on more men.

Thomes Orr is getting ready to reopen the old Siskiyou quartz ledge on Humbug creek, and has teams engaged in hauling supplies and apparatus required, so as to continue operation during the winter season. This ledge has developed fine prospects, and will no doubt yield valuable returns of gold when the quartz taken out is crushed.

Tuolumne.

The Rawhide.—*Independent*, Nov. 11: This mine is still in bonanza, and thousands of dollars are being extracted daily. It is reported in Sonora that a wheelbarrow full of almost solid bullion was taken from the mine and wheeled to the house.

The Clio.—Tuolumne *Independent*: The best work done on this property was about two years ago, when a tunnel was run 400 feet. The shoot is long and pays well to work. A substantial mill of ten stamps is on the mine. Mr. Heath, the owner, now in the East, will return to this county and resume operations some time in January.

Webster.—This is a good mine, and considerable work has been done on the property. Two tunnels are run, respectively 250 and 125 feet in length. The croppings from the mine paid $6.50 per ton, while some of the ore has yielded as high as $28 per ton from the lowest tunnel level. The property is not worked at present, but has been bonded, and bids fair to commence work in a short time.

Eagle.—The above mine is located in Blue Gulch, on the east vein of the mother lode. There is a ten-stemp mill on the property, which was kept fully employed crushing for years. The rock paid splendidly. The general average of the rock on the dump at the present time will yield about $25 per ton. The mine is opened by a tunnel and shaft, but they have not been worked for years. The property is bonded, and is thought by many old and experienced miners to be one of the best mines on the mother lode.

Stanley.—This mine has a large body of low-grade ore that will mill and was milled for $4 per ton, taken from an open quarry nearly 300 feet wide. The ten-stamp mill on the property is too small for such a vast deposit, for if a hundred-stamp mill could be placed on this mine it would be a bonanza. A good water power could be obtained at little cost.

Glanstone.—This mine is owned by Thos. Whitto. Thirty thousand dollars have been extracted from a dyke vein. Not working, as the owner is doing assessment work on another mine.

NEVADA.

Washoe District.

Resumption of Work in Gold Hill.—Virginia City *Chronicle*: The Gold Hill mines are preparing to open up again. Assessments are being paid in, and in all likelihood work on a small scale will be resumed in all of them before long. On Sunday shaftmen were put to work in the Crown Point to prepare for the opening of that mine, and it is reported that the Jacket and Belcher will shortly follow suit with preparatory work.

Summary of Comstock Operations.—The official letter from the Consolidated California and Virginia mine for the past week says: "The work of repairing the Consolidated Virginia shaft has been carried on diligently and with as large a force of men as could be employed to advantage. The shaft is now completely repaired a distance of 900 feet below the surface, and with our present progress we anticipate the repairs for the remaining distance to the 1000 level station point will be completed early in the coming week. The next step will be to put in place the air pipe from the station point up to the surface, which will consume about two days' time, and then will follow the work of cutting out the station from which the proposed drift will be started." On the 1650-foot level the north drift from the upraise is now cutting some quartz assaying from $9 to $10 per ton. From the openings from the winze below the 1650 level and from the eighth floor in the upraise above that level about 18 tons of ore assaying $19.61 per ton were extracted during the week.

In the Ophir mine the west crosscut from the main north drift on the 1465-foot level continues in a porphyry formation, carrying streaks of quartz. In the Mexican mine an upraise has been started at a point 40 feet west from the main north drift on the 1465 level, and 100 feet north of the Ophir line, and is in 16 feet in porphyry, clay and quartz. On the 900 level of the Union shaft the repairs to the joint Sierra Nevada and Union Con. north drift from the joint west drift will be completed about the middle of this week. The flow of water from the face is decreasing. On Cedar Hill the south drift from the Sierra Nevada intermediate tunnel is in 200 feet with the face in hard porphyry. In the Andes mine a west crosscut is being started from the end of the north drift on the 420 level to explore a body of quartz.

In the Best & Belcher mine all repairs to the north drift on the 900-foot level are completed and an east crosscut has been started on the Con. California and Virginia line and advanced 16 feet, passing through soft porphyry. In the Hale & Norcross mine the winze below the 1300 level is down 51 feet. Extracted during the week 12 cars of ore assaying $34.20 per ton, and five cars of ore assaying $15.92 per ton. In the Choller mine a new east crosscut has been started from the north drift, 145 feet south of the north boundary line on the 100-foot level and is out 15 feet, with the face in vein material. In the Potosi mine the east crosscut, 200 feet north of the south line, 700 level, is out 36 feet and the face is in low-grade quartz. Extracted and sent to the mill the past week 155 tons and 250 pounds of ore from the 1100 level; milled during the week 153 tons. On hand at mill 56 tons and 1700 pounds. Average battery assays $19 97, average car sample assays $25 68. The west drift from the station 820 level, Ward shaft is out 290 feet; face in porphyry.

BRITISH COLUMBIA.

Fortunes in Gravel.—Spokane *Review*, Nov. 12: Operations have been practically suspended for the winter at the mammoth placer mines of the Kootenai Hydraulic Mining Company on the Pend d'Oreille and Salmon rivers, in British Columbia. A rise in the Pend d'Oreille washed out the foundation under the boxes, set on gravel. "This was of little consequence, however," said President George Goodhue last night. "We had finished the test and accomplished all that we started in to do this year. We haven't been working this season for pay, but will begin operations on a large scale in the spring at Seven and Fifteen Mile creeks and work the gravel for all there is in it. We have fully demonstrated the fact to our own satisfaction, at least, that we have pay ground. We will keep a force of 10 men at work nearly all winter, and expect to employ 100 to 150 next year."

The company owns a very large body of ground on both rivers, and have expended upward of $100,000 in improvement and development this season. The gold is unusually coarse, although there is considerable flour gold, most of which they have fortunately devised a means to save.

There is a great deal of rich ground yet unclaimed on the Salmon river. It takes money and energy to work such properties, but all real mining men who have inspected that country agree that fortunes are waiting there for men of means and courage.

IDAHO.

The Granite Mine.—Wardner *News*: The Granite mine, on Nine Mile gulch, under the management of John Porteus, has 50 men on its payroll. Two shifts are employed at the mine and a day shift at the mill. John Thomas is foreman and J. P. Keane is shift boss, assayer and surveyor. The concentrates are shipped to the Kansas City Smelting and Refining Company.

OREGON.

A Bonanza Cleanup.—Baker City *Democrat*, Nov. 6: The Bonanza mine at Robinsonville again sends in a neat cleanup of the precious metal after a short mill run. Late Sunday evening Supt. Al Geiser arrived in this city with bullion amounting to $2000, which he deposited yesterday morning at the First National Bank.

Mill Bought.—Baker City *Democrat*, Nov. 6: The negotiations pending for several days between Mr. O. B. Hardy, one of the lessees of the Phœnix mine at Robinsonville, and Mr. P. Basche, of Besche & Company of this city, for the purchase of the five-stamp mill on the Evening Star mine at Gimletville, have been closed and Mr. Hardy and associates have purchased the plant.

Mr. Hardy has let the contract for the moving of the plant to the Phœnix to Messrs. McEwen & Daly, the stage men at McEwen, and they will get their teams ready for its transportation at once and before the snow of winter sets in.

WASHINGTON.

Copper Ore Found.—Seattle *Press-Times*, Oct. 26: A number of mining men congregated at the mineral palace this morning to inspect 1200 pounds of copper ore which was being placed in the palace on exhibition. The ore comes from Trout Creek mines, eight miles from Index, on the Great Northern railroad, and was brought in by Colonel B. Townsend and Mr. A. Merchant. Mr. A. Thurston Hayden, the assayer, came in with them. He says:

"On Trout creek we have located 26 copper claims. Of these two are developed claims and the rest are prospects. The two principal leads, called the Blewitt and the Copper leads, are thought to be very valuable. The Blewitt lead is exposed for 110 feet, with an average width of 15 feet. It is a double-gang lead, consisting of quartz and talc. The quartz portion assays 15 to 25 per cent copper and 3 to 7 per cent silver.

"The Copper lead shows up 36 feet exposure and 6 feet in width, with an average assay of 29 per cent copper and a little silver.

"The ore is of a permanent character. It is called the chalco-pyrite, which is the copper ore of commerce as found in Eastern States."

A party of five miners have been at work on these leads since the 1st of March and have not been compelled to close operations on account of the snow.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 16, 1893.

Silver has been a little weaker during the week, and has declined both at home and abroad. The decline can be ascribed to no new influence, but is due to the general operation of causes which have long been bearing the silver market. It is probable that at the opening of Congress in December the matter of remedial legislation will be taken up and no doubt brought to some definite conclusion.

Coins of 1893.

The face value of the coins made at the United States Mints in October and for the first ten months of the calendar year will be found annexed:

	For October.	Jan. 1 to Oct. 31.
Double Eagles	$1,365,000	$15,938 880
Eagles	5 618,200	13.833.490
Half Eagles	2,576 600	6,646,575
Quarter Eagles	.....	75.157
Standard Dollars	.....	1,455,565
Half Dollars,	220,000	1,752.783
Half (Columb'n) Dols.	.....	2,020 052
Quarter Dollars	97.000	2,078,575
Quarter (Col.) Dols	.....	10,006
Dimes	100.030	631,056
Five Cents	40.000	546,878
Cents	40,100	377.516
Totals	$10.003.900	$45.372,533
In 1892	3.466,400	41,412.795

Only sample lots of standard dollars have been coined since July 1st. There has been an increase of about $8,000,000 in eagles and $1,000,000 in half eagles over the same time last year, and a decrease of $3,500,000 in standard dollars.

Copper.

A large sale of Copper is reported to have taken place in Boston on the 1st. The transaction is given at 1,000,000 lbs. for January and forward delivery, the price being 10c—an advance of ¼c on rates prevailing at the time of sale. There is a fairly firm tone in the market, and prices have an upward tendency. Eastern holders of Copper are confident that manufacturers will soon be compelled to buy, and therefore hold firmly for their own prices which they expect to be paid. Exporters, on the other hand, are not willing to improve their bids, but electrolytic Copper in particular has been sold at rather low prices. Rumors of a combination of foreign bankers and American producers seem to have no substantial basis.

Trade in Quicksilver.

The receipts of quicksilver at this port during October and for the first ten months of the present year compare with the preceding year as follows:

	For Oct.	Jan. 1 to Oct. 31.
1891, flasks	1,781	12,392
1892	2,170	17,148
1893	2,718	20,024

Exports by sea from San Francisco during last month were 583 flasks, including 286 to Mexico, 100 to Central America, 200 to Australia and 2 to British Columbia. Exports by sea for the first ten months of the year were as follows:

	Flasks.	Value.
Ten Months	11,825	$481,215
In 1892	6,748	279,830

Lead.

The lead market is being persistently beared, and prices continue very low.

Silver and the Metals.

NEW YORK, Nov. 16.—Following are the closing prices for the week:

	Silver in— London.	N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, Nov. 16, 1893.

The past week has been a most active one in the Comstock market. The boom culminated last Friday, Nov. 10th, when the excitement was great. The largest record for several years on the San Francisco Board was made at the regular session Saturday morning, when a total of 51,578 shares were sold in 35 mines, including 16,000 shares Lady Washington at 5c, 2500 Alta, 1500 Andes, 1050 Belcher, 2495 California, 1900 Exchequer, 1400 Curry, 1950 Kentuck, 1500 Overman, 1100 Nevada, 1150 Segregated Belcher, 1100 St. Louis, 1050 Union, and 3350 Jacket. Sales for the week were as follows:

November 6, shares	37,865
November 7, shares	35.530
November 8, shares	23,895
November 9, shares	48,800
November 10, shares	54,535
November 11, shares	51,575
Total shares	252,200
Previous week	102,090

During the present week prices have receded, though there has still been great activity.

The following are the assets and liabilities of the Nevada mining companies on November 1st, as shown by the monthly statements filed according to law:

COMSTOCK MINES.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CENTRIFUGAL LIQUID SEPARATOR.—Arthur F. L. Bell, of San Francisco, Cal., assignor to the California Petroleum and Asphalt Company of same place. No. 508,270. Dated Nov. 7, 1893. The particular purpose for which this machine is intended is for operation upon materials containing sand, silt or other foreign substances, as for example, in the process of separation of water from mineral oils, mineral pitch, liquid asphaltum and other kindred substances. The object is to dispose of the dirt, sand and other foreign substances during and together with the separation of the heavier components of the material under treatment, the discharge being continuously effected. The machine consists of a rotating bowl having inclined walls and discharge holes in the line or plane of its greatest diameter. Within the bowl are guide plates to direct the heavier material to the peripheral discharge holes, and suitable division plates to direct the lighter materials to their discharge from the top of the bowl.

BOILAA ATTACHMANT.—Frank X. Fischer, of Oakland, Cal. No. 508,007. Dated Nov. 7, 1893. This invention relates to that type of boiler which is supported upon vertical water legs. The improvement consists in forming the water leg of separated sheets, and an end-bar riveted between them, and having at points between the rivets hand holes on each side of which are screws passing into the bar. Over these handholes are cover plates secured to the face of the bar. The object of this construction is to provide a hand hole which will make a tight joint and be of such a character that as many of them may be provided as necessary to keep the water legs thoroughly clean.

FASTENAE FOR THA MARTING RAILS OF SASHAS. Fredsrick C. Immel, of San Francisco, Cal. No. 508,389. Dated Nov. 7, 1893. The object of this invention is to provide a simple and effective sash-fastener adapted to automatically lock the sash in such a manner that it cannot be released from without, but can be easily disengaged from within. It consists of a spring-controlled bevel-headed latch seated in the meeting rail of the lower sash and having a notch in one side of its head, a recessed keeper plate seated in the meeting rail of the upper sash and having a side flange with which the side notch of the latch head is adapted to engage, and a means connected with the latch for pulling it sidewise to disengage its notch from the flanges, and thence backwardly to disengage the head from the recessed keeper plate.

LATCH AND LOCK.—John E. Armstrong, of Santa Cruz, Cal. No. 508,627. Dated Nov. 7, 1893. The device is one in which the latch is adapted to be operated by either a rotary or a lineal movement of the knob-spindle. To accomplish the result, the shank of the latch is slotted; with this a swinging lever engages, and a cam on the knob-spindle impinges upon and operates to swing the lever, either by an axial movement of the spindle or by its longitudinal movement. The operating lever is adjustable to adapt its position to various thicknesses of doors. A locking arm readily operated from within is adapted to engage and lock the knob-spindle, and means are provided, operated by a key inserted in a keyway in the outer knob for relieving the locking arm from without.

BUCK RAKE.—Christopher Coulthard, of Emmett, Cal. No. 507,998. Dated Nov. 7, 1893. This invention relates to an improvement in devices for raking hay. It consists of a rake-head having teeth fastened therein, posts suitably braced and extending upwardly behind the rake-head so as to form fulcrum points about which the rake revolves in turning over to discharge its load, and they are so arranged that the rake immediately returns to its proper position as soon as the load is discharged. Swivel connections are fixed to each end of the rake-head, and the teams for drawing the rake are attached at these points. A lever-arm is arranged to be introduced between the upper rear portions of the frame, so that by slightly lifting the frame the points of the teeth will catch in the ground and allow the rake to reverse. The bar slips out of its position the moment the rake starts to turn. Large quantities of hay can be handled in this manner, and the rake slips smoothly over the pile that it has made.

SMALTING FURNACA.—Joseph L. GIROUX, of Jerome, Arizona. No. 508,381. Dated Nov. 7, 1893. This invention consists essentially in the employment of a supplemental blast drum or drums surrounding the bottom or crucible portion of the furnace having passages through which air may be forced directly into the crucible, in addition to the main blast drums which are situated higher up in the usual manner. These supplemental pipes receive air from an air pump or other source which will give considerable pressure, and air is forced through them into the molten material within the crucible. The main blast drums are provided with covers and hinge bolts, which are easily disengaged to allow the covers to be opened without entirely removing the bolts from their attachments. These covers have sliding doors fitted upon them in line with the tuyere openings, and the lower edges of the doors have slots of such shape that the doors will close down and fit around the rod while the latter is being used to clean the opening, and thus prevent any escape of air.

Assessment Notices.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees held on the fourteenth day of October, 1893, an assessment (No. 72) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, Room 69, Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of December, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DUNBROW, Secretary.

Office—Room 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

To Mine-Owners (Gold) Requiring Machinery and Working Capital:

A company is prepared to furnish a stamp mill of from 80 to 100 stamps, with all accessories, and a limited working capital, for a liberal interest in a gold property that is sufficiently developed to ensure an undoubted supply of payable ore. No property need be offered that will not stand a close and thorough examination and working tests by experienced engineers. Address with full particulars, and if possible, with rough sketch plan showing developments, and with the references of the engineers or others reporting on the facts.

Address, **GOLD MILL,**
Care "Engineering & Mining Journal,"
27 Park Place, New York.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest in this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States Inventors half the advantages possessed by this old, well-tried and experienced firm.

CALIFORNIA

Not a Political Device.

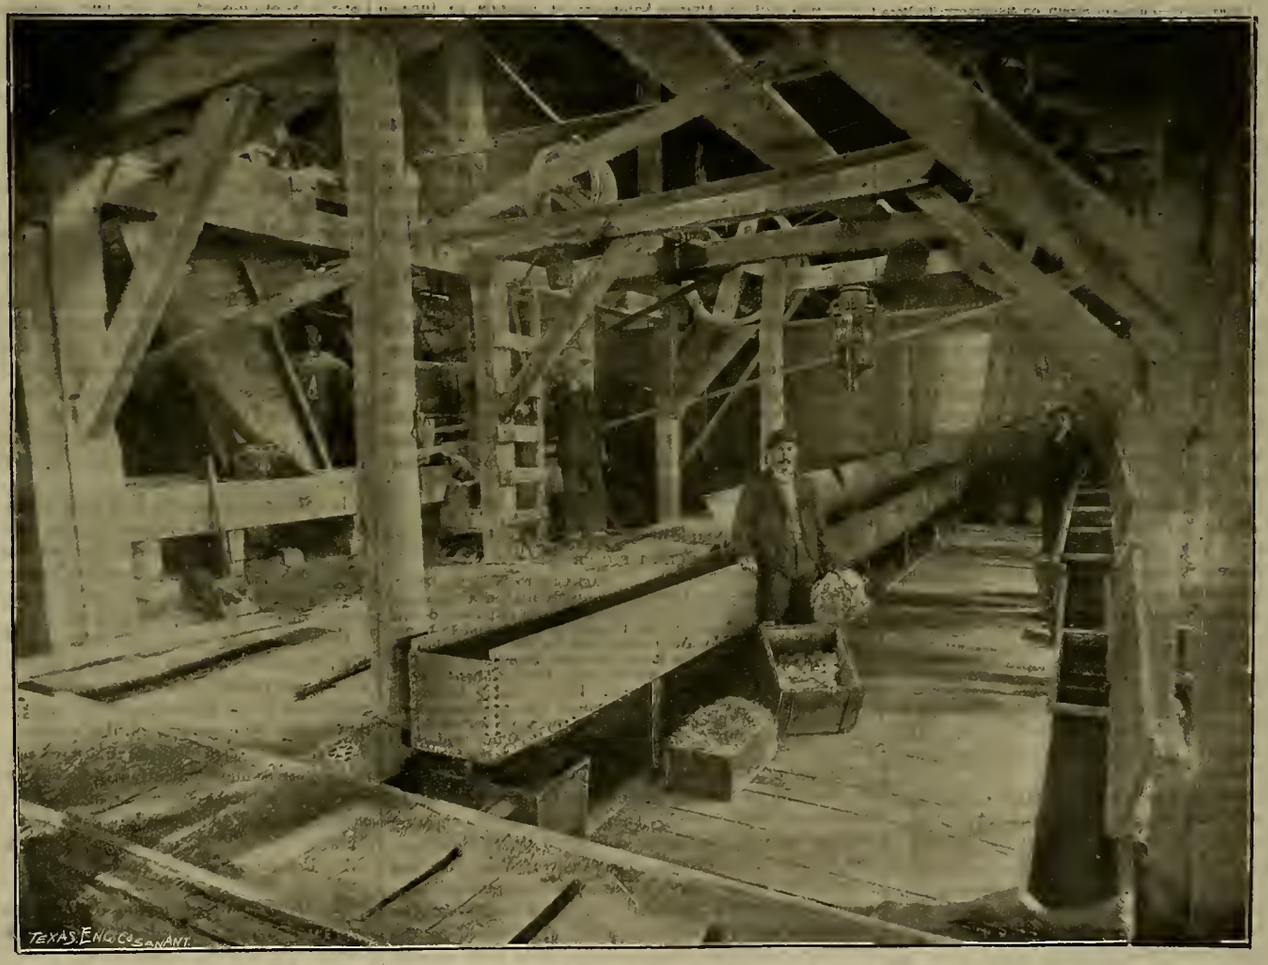
The Shasta *Courier* complains bitterly that the law suspending assessment work on unpatented claims for 1893 is a "bilk and political trick and a vote-catching measure got up by Democratic Congressmen to catch votes in mining States." All miners in that section are said hy the *Courier* to have nearly finished their assessment work, and the law is of little benefit to them. The *Courier* is unaffected; and California miners are not that kind of people, and do not show that kind of spirit.

THE silver fight is to be resumed just as soon as Congress meets. The silver men are making preparation for an active campaign, and Congressman Bland thinks public sentiment has already so changed on the subject that the House will adopt a free coinage hill. Mr. Bland's zeal in behalf of the cause he so ably advocates has doubtless hlinded his judgment, for it is not to he expected that free coinage can so soon be re-established as the policy of the nation. At the same time the silver men are backed up hy a strong sentiment throughout the country that there shall be positive legislation recognizing silver. There are two sufficient reasons why silver should receive favorahle legislative action, and they are: The interests of the country demand that it he placed on an equal hasis with gold as a money metal; and it is the duty of Congress to foster in every practicable way an indnstry of vital importance to many States and Territories.

ADVICES from Washington indicate that the fight over the proposed removal of duty from lead-silver ore will be very hitter, and that it will he conducted on the same lines as in the preceding Congress. Generally speaking the controversy is hetween the silver miners on the one hand and certain of the smelters and manufacturers on the other. The issue is exceedingly doubtful; but the chances at present appear to indicate repeal. The late election is not accepted by the Administration as a rebuke to its tariff-for-revenue policy, and the work of tariff reform will without doubt he attempted on the plan indicated in the Chicago platform.

THE long-standing strike of the English coal-miners has heen settled through the intervention of Premier Gladstone. The men will resume work at the old rate until February, when a Board of Conciliation will be formed. The hoard will consist of 14 coal-miners and 14 coal-mine owners. All collieries are to hegin work, as far as practicahle, immediately, and the men will not be discriminated against in returning to work. The hoard is to have a neutral chairman with a decisive vote, and they also have the power to determine the wages after March. The result is a substantial victory for the strikers.

IT may perhaps clear up a matter of doubt in some minds to state that the suspension of assessment work law just passed hy Congress likewise supersedes the operation of any local law on the subject requiring the performance of $100 lahor on unpatented claims. State and local laws on mining matters can be made not in conflict with federal enactments; and clearly such local laws can not stand hefore the federal act just passed.



THE CYANIDE PROCESS AT THE MERCUR MILL—PRECIPITATING TROUGHS.—*See page 341.*

necessarily harsh. It is true, as it says, that "a mine worth holding is worth doing assessment work on;" but it is also true that the miners in the silver States are in no shape to do any kind of development on properties they hold and intend to work in good faith. Many speculators who have obtained possession of claims will receive the full benefit of the law. But it was manifestly impossible to exclude this class from the operation of the law and, in order that worthy persons might not he injured, it was necessary to include all. It is probable that if there had been any general protest against the law in this State, California would have been exempted with South Dakota. But there was not, and we were included.

Those claimants who have already performed their work on good claims have certainly not wasted their labor. If the law has not henefited them, it has done them no harm. It shows a small spirit to hegrudge your neighhor a henefit you do not receive yourself, when your interest is not

Notes of the Midwinter Fair.

The work of preparation of a mineral exhibit at the Midwinter Fair by the Miners' Association Committee has so far progressed that it is certain there will be made the largest and most complete display of the products of California mines ever attempted. The counties, which at first intended to show their mineral resources as part of the county exhibits, are gradually falling into line and will contribute to the general collection. Each county will be given full credit for all it displays, but the management reserves the right to assign position and also to use such parts of each exhibit as it chooses to make up part of a general display of any given product. This decision is necessary to insure a proper distribution of the displays and suitable representation of the various minerals according to their importance and attractiveness. It should be added that no county is prevented from showing its mineral products with its general exhibit, provided it contributes its full share to the State display.

The general exhibit by the Miners' Association will be in charge of Supt. E. H. Benjamin of the Hayes Red Hill mine, Trinity county. Mr. Benjamin is a practical miner, and a business man as well.

The mining machinery men have not made public their plans for the fair, but without doubt they will be adequately represented.

The management has practically made the allotment of near 10,000 square feet of space for the mining exhibit in the eastern center of the Mechanic Arts building. Private exhibits of mining machinery and a big quartz mill in operation will occupy the adjoining space under the gallery. The mineral arch, which formed the most notable and attractive portion of California's mining exhibit at the World's Fair, is now being packed there for transmission to the Midwinter Fair. Here the committee in charge of the mining exhibit will arrange for setting it up and adding to its features to make it even more imposing and complete.

THE building of a cable from San Francisco to Hawaii is again being agitated. The State Department is now said to be favorable, the very inadequate means of communication having been made more than ever manifest on account of the political imbroglio.

AN address to the miners of California by the executive committee of the California Midwinter Fair exhibit will be found on page 349 of this issue. It deserves the careful attention of and a generous response by the mining men of the State.

More Hydraulic Mines To Start.

Official notice of reappointment of the California Debris Commission arrived last Saturday, and Monday the commissioners met to consider a number of applications. License to mine by the hydraulic process was granted to the owners of the Corbiere & Bean mine, near Clipper Mills, on the watershed of the North Ynba. The owners have built a debris dam in accordance with the requirements of the Commission, and the work has been approved.

Authority to construct dams in accordance with plans submitted to the Commission was granted in the following cases: Craycroft mine, Eureka mine and Excelsior mine, near Downieville, which drain into the North Yuba; the New York mine, owned by Westall & Hughes, on Howard creek, Sierra county; and N. C. Tully's Omega mine in Nevada county, which drains into the Middle Yuba. In case the construction of these dams is in accordance with plans, the Commission will issue license to mine.

From the foregoing it will appear that the Monday session of the Board was more important in results than any yet held. One mine is granted permission to resume operations and five others are told that they may start up just as soon as they comply with certain necessary requirements. The conditions have already been considered and accepted by both the commissioners and owners of the mines. Final grant of license will be denied only in case the miners themselves fail to fulfill requirements they have already agreed to.

Two things have become perfectly evident since the Debris Commission began its work, viz.: The hydraulic miners of the State propose to make the most of the Caminetti act, and the Debris Commission intends to furnish them every reasonable and lawful facility to resume. So far, no application to mine has been rejected, though of course it is not at all to be expected that none will be. The number of inquiries addressed to the Commission is large, and indicates a degree of interest in, and practical approval of, the act among miners that was scarcely expected at the time of its passage. It is getting too late in the season for any extensive movement among hydraulic mines which have not already attempted to take advantage of the law; but it may be confidently expected that next year there will be a very great deal of activity.

Meanwhile, those who intend to make application to the Commission should get their plans in shape. Miners in the various districts should, wherever possible, combine and make application at the same time, so that the personal inspection which must be made by the commissioners may not require separate visits for each mine. It is too much to expect that the commissioners will make prompt trips to remote points in all cases. Much delay may be avoided if several mines are inspected at the same time.

The Assessment-Work Bill a Law.

Following is a sample of very many letters daily received by the MINING AND SCIENTIFIC PRESS:

SACRAMENTO, Nov. 20, 1893.

TO THE EDITOR:—Can there be any question about the correctness of the law regarding assessment work on unpatented mineral claims, as published in the PRESS of the 11th and 18th inst. The Denver (Colorado) *News* states that the bill in question did not become a law, and the Reno (Nevada) *Journal* states that the Senate amended the act by excepting from its benefits corporations and non-resident owners. Being largely interested in some silver mines that are unpatented, I am anxious to have the facts, and the officials here are without any positive information on the subject, both at the Land Office and State Library. JOHN A. MCINTYRE.

The matter is of such importance that it is natural for all locators on unpatented claims to desire to make "assurance doubly sure." There is no doubt whatever that the law has been passed and signed by the President, and is now in operation. The Denver *News* does not know what it is talking about. Its statement has been widely circulated and it has done much mischief. The Reno *Journal* is likewise in error. The mistake of the latter doubtless arose through the fact that such amendment was considered, and there was at one time a probability that it would be incorporated in the bill. But it was not.

The MINING AND SCIENTIFIC PRESS received copies of the law both from Senator Perkins, of this State, and from Representative John C. Bell, of Colorado. Congressman Bell was the sponsor for the measure. It was introduced by him at request of the miners of Colorado, who were suffering from hard times and upon whom the full operation of law would have worked a hardship. The bill was approved by President Cleveland November 3, 1893, and took effect from that date.

Accompanying the text of the law sent to this paper by Congressman Bell is the following letter:

HOUSE OF REPRESENTATIVES,
WASHINGTON, D. C., Nov. 10, 1893.

DEAR SIR:—Yours of November 2d received this A. M. As the Mining Assessment bill has now become a law, and was received in the document room printed in law form, I enclose you a copy of that instead of the original bill. JNO. C. BELL.

The text of the enclosed law is precisely the same as heretofore published in the MINING AND SCIENTIFIC PRESS. There ought to be no further doubt about the matter.

Gravel Mining in Plumas and Sierra Counties.

By H. W. Turner of the United States Geological Survey.

As a result of the Caminetti law there promises to be a revival of gravel mining in the Sierra Nevada. Already the Smartsville gravel deposits are being again washed by the hydraulic method, and, it is said, preparations are being made to hydraulic at other points.

During the past season the writer has been engaged, under the authority of the U. S. Geological Survey, in making a geological map of a portion of Plumas and Sierra counties.

All the old river gravel areas, where exposed and of any size, are to be represented on this map, and, where practicable, the gravel channels under the lava ridges will be indicated. In gathering data for this map the writer became aware that very large bodies of auriferous gravel exist in the mountains which have not yet been washed for gold. Much of the gravel is exposed to view, and other channels are covered with lava.

The gravel deposits about Scales and Poverty Hill, in Sierra county, offer a field for extensive hydraulic operations through a series of years; and a large amount of gravel still remains at Laporte, Eureka north, and at other points. Under the lava ridges the amount of gravel is definitely known at only a few localities, and the expense of running tunnels or sinking shafts to find the gravel bodies, as well as the chance of not finding any gravel at all, makes this the most hazardous method of gravel mining, except where the existence and course of the channel has been carefully determined.

Many miners, it would appear, take it for granted that under all the lavas there are gravel channels. This is far from true. It is now ascertained beyond possible doubt that the lavas that cover so many of the Pliocene gravel channels, issued from the earth's interior from openings chiefly along the summit of the range, and only locally at other points. The lavas that came out of these old volcanic vents along the crest of the range flowed down the old valleys, displacing the rivers and covering up their gravels.

Many of the lava-capped ridges of the present Sierra Nevada represent portions of these old river valleys, and the chances of finding gravel under the lava caps are therefore good, but this does not apply to all of the lava areas along the summit of the range, some of which are dikes of hard lava that came out at the point where they now are, and others represent orifices of the volcanoes that poured forth the floods of lava that displaced the Pliocene rivers.

It is obvious that under such lavas gravel areas are not to be looked for, yet a number of cases have come under my observation where miners have run tunnels or sunk shafts into these old volcanic orifices in the vain hope of finding gravel under the lava, which came up from the earth's interior at that precise point.

In many cases, as between Howland Flat and Poker Flat, the gravel channels have been broken up and displaced, and penetrated by dikes of hard lava. The once continuous gravel channel is in this way broken into separate bodies. On account of the volcanic eruptions and the consequent displacements that have taken place, it is probable that much difficulty will be experienced in following the old river channels about Blue Nose, Mt. Fillmore, Rattlesnake Peak, Saddle Back, and other volcanic centers. H. W. TURNER.

San Francisco, Nov. 18, 1893.

THE Giant Powder Company Consolidated has selected the following board of directors: J. N. Knowles, L. P. Drexler, E. B. Pond, Gustav Sutro, L. A. Monteagle, E. B. Root, J. R. Spring. For these gentlemen 18,505 shares were voted. A meeting of the board was subsequently held and the following officers elected: President, E. B. Pond; vice-president, E. B. Root; treasurer, Bank of California; superintendent, Frank Roller.

A MONTANA PAPER proudly makes the statement that "Montana has produced over $400,000,000 in gold, silver, copper and lead, or nearly one-third the entire production of the United States." It is well enough to be accurate. Montana has not produced one-third the entire output. The total figures for gold alone from 1792 to 1892 inclusive are $1,969,692,949, silver $1,158,831,896, or a total for these two metals of $2,120,524,845.

PLUMAS COUNTY seems to have "knocked the persimmon" at the World's Fair, so far as the California mineral exhibit is concerned. The exhibit of that county was awarded a medal and diploma for "a collective exhibit of gold, silver, copper and iron ores."

Profits of Gold Mining.

By W. S. Chapman.

It has been frequently said that mining is gambling; that mining has all the elements of gambling. To this I demur. I contend that mining is not gambling; that it has more of the elements of safety and certainty than almost any other kind of business; that it is very much in favor of mining that there is no competition, and can be none, in that business, while in all other business relations competition cuts a very important part.

What constitutes the uncertainty in mining is that it is largely conducted by men without experience, and men who have never succeeded in any other business. Bring to bear on mining the same experience, the same business qualifications, the same careful and constant attention that must be given to any other business to insure success, and failure will result less frequently than in any other business. As an example of this, I refer to statistical facts, which show that not more than four per cent of merchants succeed through life. In other words, 96 per cent of those who engage in the various mercantile pursuits fail at some stage of their careers. I think that that is a greater percentage of failures than can be shown in the mining business.

Another great advantage in mining is that every dollar produced is a new dollar that never was in existence before. When a merchant makes a dollar, that dollar has only changed hands; there are no more dollars in existence than there were before.

I believe that the disastrous condition of financial affairs in this country now is mainly due to a lack of enterprise in the development of the gold mines. In proof of this proposition, I will refer to the condition of gold and silver mining in 1860. In that year there was only $150,000 of silver produced in the United States, while in the same year the gold product of the United States was $46,000,000. The following year (1861) there was $2,000,000 of silver produced and the gold product fell off $3,000,000. In 1865 there was $53,250,000 of gold and $11,250,000 of silver. In 1870 there was $50,000,000 of gold and $16,000,000 of silver. In 1880 there was $36,000,000 of gold and $39,000,000 of silver. At that time the production of silver, as will be seen, exceeded that of gold. In 1885 there was $31,800,000 of gold and $51,600,000 of silver. In 1891 the product of gold was $33,000,000 and of silver nearly $75,500,000. This shows a very great change in the product of the two metals, gold falling off from $46,000,000 in 1860 to $33,000,000 in 1891, while silver, which in 1860 amounted only to $150,000, rose in 1891 to $75,500,000. This shows a very great disproportion in the production of the two metals, and was in itself a prime cause of alarm among that class of people now known as "gold bugs."

Had our people continued gold-mining, so as to keep the production of gold and silver somewhere near an equal basis, the alarm which resulted in the great conspiracy which demonetized silver would probably never have occurred. And I believe now that the only wise thing for gold-producing countries to do is to encourage and foster the development of gold mines by every reasonable means. I believe that gold-mining ought to be encouraged by every business man on the coast. It ought to be taught in the schools. It ought to be encouraged as a legitimate business, and not as a gambling one.

California now produces about $12,000,000 to $13,000,000 of gold per annum. It is safe to say that that $13,000,000 turns once a day. If that be so, the benefit derived from the use of that amount of money in a year would be simply enormous. The product of the California mines could be easily raised to $20,000,000 or $25,000,000 per annum. Gold mines, both in placer and quartz, exist almost without limit in the mountains of this State. It has been said by a very prominent editor of San Francisco that he would not be surprised that the amount of gold yet in the mountains is equal to what has already been extracted therefrom; while, as a matter of fact, all the gold taken out is but as a drop in the ocean compared to the amount yet remaining in the Sierra Nevada mountains.

It is safe to say that the gold mines of this State have scarcely been prospected. And, with all our improvements and facilities for working gold quartz, our well-known methods of saving sulphurets, and saving, practically, all that there is in the quartz, mines that a few years ago would not have paid running expenses are rendered very profitable.

If gold-mining were fostered and encouraged, and not criticised as a gambling enterprise on the Pacific coast, scarcely a year would have passed before we would have an abundance of money. Times would be easy. We would be putting $25,000,000 of gold money into the channels of trade every year, the effect of which would be felt not only on the Pacific coast, but all over the world.

I see by a statement in a newspaper of this city that Armour & Co., of Chicago, a while ago purchased $500,000 of gold in Europe, for immediate importation, and that the company contemplates further purchases; and the move is said to be in the interest of relieving the financial stringency. Now, if Armour & Co. had developed a gold mine like the Kennedy mine, for instance, which would have produced more than $1,000,000 in 12 months, that would be adding just so much new money to the circulating medium of this country, while purchases in England to bring to this country add not a single dollar to the fund. In one case, the good that would be derived would be beyond computation, while in the other it is simply a case of money changing hands, which is of very temporary utility.

W. S. CHAPMAN.

San Francisco, November 20, 1893.

Foundry Notes.

A HUNTINGTON ROLLER MILL has been put up on the Reed Bros.' mines, five miles west of Perris, Riverside county.

THE McGlew Ore Concentrator Company has just shipped two concentrators to Nevada county for the German Mining and Milling Company. They will be used in a ten-stamp mill. There have been shipped this week also one McGlew concentrator to the Bancroft Mining Company, Mariposa county, for an 8-stamp mill and one concentrator to the Gem mine in Shasta county. An order has just been placed by a Mexican company for ten concentrators, to be completed as early as possible. Thomas McGlew, president of the company, is about to leave for Mariposa county on business.

Two Woodbury concentrators have just been shipped to Butte county for the 10-stamp mill of the late D. K. Perkins. Two have lately been shipped to Prescott, Arizona. Four have just been furnished the Union Iron Works on another order. Negotiations are about to be closed for the installation of a number of concentrators in a Utah mill, and a Montana mill is likewise about to equip itself with Woodbury concentrators. Mr. Woodbury may go to Utah to superintend placing in position the concentrators. He reports that there is much improvement in business and an increasing demand for concentrators.

THE schooner Nora Harkins sailed last week for Ecuador, loaded down to the gunwale with a part of the hydraulic equipment of the Playa de Oro Mining Company, furnished by Francis Smith & Co. The same schooner last spring carried away the first half of the outfit, which consists of 11,250 feet of 22-inch pipe, 14,220 feet of 36-inch, Nos. 7, 8, 9, 10, 11. There are two No. 6 giants, two No. 8. There are besides pipe tools, water gates, complete equipment for pipe shop, and 140 barrels of asphaltum. The work of placing the hydraulic plant in position at the Playa de Oro fields has been going on for some time, 8000 feet of pipe being made up.

Book Reviews.

A TEXT BOOK OF COAL MINING:—By Herbert W. Hughes. With numerous illustrations; published by J. B. Lippincott & Co., Philadelphia. For sale by Osborn & Alexander, San Francisco; price $6, free of transportation charges.

It is the aim of the author of this work to supply in a book of moderate dimensions, information with which the student and practical miner should be familiar. The various branches of coal mining, from search for coal and preliminary operations to the preparation of the product for market are consecutively and intelligently treated. Much attention is paid to the general detail of colliery work, on the ground that collieries are more often made remunerative by perfection in small matters than by bold strokes of engineering. Numerous references to authorities from whom fuller information on particular subjects may be sought are made at the end of each chapter—a feature that will be found valuable and instructive. The work on the whole seems to have been prepared with much care, and to be a valuable contribution to literature on the subject.

ELEVENTH REPORT OF STATE MINERALOGIST (First Biennial):—By Wm. Irelan, Jr., State Mineralogist. Published by State Printer.

The issuance of the State Mineralogist's report for the two years ending September 15, 1892, has been delayed until this time because of a determination on the part of the authorities that its contents should be abridged. The report of Mr. Irelan, as originally submitted, was quite voluminous, and contained many papers on a variety of subjects by scientists well known in the State. These included essays on fossils, aboriginal shell money, on Santa Rosa island, on San Miguel island, etc. The work of condensation was entrusted by the State Board of Examiners to Mr. Charles G. Yale. It has been the effort of the editor to eliminate such matter as was not directly related to the mining interest; and, besides, several papers on mining, which were a practical reproduction of papers already published, were omitted. Reports of assistants in the field were condensed. Some idea of the extent of the condensation may be gleaned when it is stated that in the original manuscript there were 2307 pages, largely type-written. This was reduced to about 844 pages. The total paging of the printed report is 612. The chief features of the report as printed are papers on the "Geology and Mineralogy of Shasta County;" "Geology and Mineralogy of Portions of Tehama, Colusa, Lake and Napa Counties;" "Geology of San Diego County; also of Portions of Orange and San Bernardino Counties," all by Harold W. Fairbanks, F. G. S. A.; "Hydraulic Ejectors," by E. A. Wiltsee, M. E.; "A Dissertation Upon the Origin, Development and Establishment of American Mining Law," by A. H. Ricketts of the San Francisco Bar; and reports from the various counties.

THE following complimentary notice of C. H. Aaron's work on "Assaying" is contained in the New York *Engineering and Mining Journal* of November 11th:

These little books, now in the second edition, are intended to be a guide for those who have not the requisite knowledge of chemistry to take up the more thorough and comprehensive text-books like those of Kerl, Beringer, Brown, Mitchell and others. Mr. Aaron the author, is a practical metallurgist of long experience, who knew exactly what was needed in the kind of a book he set out to write, and accomplished his purpose well. The first part of the book treats of the assay of gold and silver ores; the second part takes up the assay of gold and silver bullion, while in the third part methods for the detection and determination of copper, tin, bismuth, antimony and other metals are more or less fully described. There are many practical hints of value in these little books, which every assayer may read with profit.

Slickens.

THE *Mining New Era* has been established at Forbestowo, Butte county.

GOLD FINDS are reported from the Organ mountains, 50 miles northwest of El Paso, Texas.

FOUR men in the Cedar river (Mont.) placers cleaned up $16,000, the result of the season's work.

THE Humboldt Oil Company, on the South Fork of Eel river, Brueland, Humboldt county, is about to renew operations.

ANDY RODGER, of Alta, has purchased the Golden Eagle drift mine, situated at Shady Run, in eastern Placer county, from Henry Dresler for $10,000.

THE Utica Mining Company, by Alvinza Hayward, president, has subscribed $2000 to the Midwinter Fair. The Utica is one of the best-paying mining properties in California.

THE machinery of the Champion mine, at Nevada City, was started up November 18th. There were speeches by various notables and a fine lunch. The ponderous machinery worked like a charm.

SURVAYOR-GENAAL ROBINSON of Colorado has increased the fee for surveying a mining claim from $25 to $30. This was done because the expenses of the office have been greater than the receipts of late.

A PORTLAND (Or.) syndicate proposes to make a tunnel at Ruby, Wash., 2200 feet long, which will tap the leads at a depth of 2000 feet and by crosscutting will give an outlet to seven valuable properties.

THE Brown Bear Mining Company of Deadwood, Trinity county, has adopted the rule that any employe found drinking liquor or gambling will be summarily discharged, says the Weaverville *Journal*.

THE Bimetallic and Elgin smelters, at Leadville, Col., are now running full time, and other properties recently in operation have not been affected by the repeal law. It is a matter of congratulation in Colorado that silver has not declined more than it did, following passage of the Act.

THE National Nickel Company, whose mine is located 40 miles southeast of Lovelocks, in Churchill county, Nev., is about to commence the construction of big works at that point for reducing nickel ore found in that district.

MESSRS. DUCHOW, DAAKE & Co. have formed the Tuolumne Mining Bureau and Agency, with headquarters at Sonora, Tuolumne county. It will be the business of the bureau to handle mining properties. Agencies will be established in the principal cities of the United States and Europe.

THE Ibex Mining and Milling Company has been incorporated. Principal place of business, Los Angeles. Capital stock, $100,000, with T. B. Burnett, F. B. Henderson, A. P. Maginnis, J. F. Burns, A. Carter, L. A. Grant, J. E. McNeil, G. Holterhoff, Jr., and Charles A. Marriener of Los Angeles as directors.

THE county commissioners of Spokane, Wash., made an appropriation of $2000 for the Spokane exhibit at the Midwinter Fair. The money was given upon one of the strongest petitions ever laid before the board. The action meets with very general approval. The chief feature of the exhibit will be mineral.

A COMPANY has been formed at Forbestown to work the Bullion mine, the property of S. K. Reasoner. The officers of the company are: Frank Willet, president; Jesse T. Clemens, treasurer; Chas. Bouvier, secretary; John Pellar, foreman; John Crossman, W. Kendall, Wm. Smitheram and Thos. Stocker, directors.

THE Idaho Consolidated Mining Company has been incorporated by Robert McMurray, A. E. Head, A. C. Hamilton and W. H. Martin of this city and John W. Greenbank of Alleghany, Cal. The subscribed capital stock is $10,000,000. Mr. McMurray holds $9,800,000 of the stock and the others hold $50,000 each.

A CURRENT newspaper paragraph says: Over 100 professors and mining engineers and experts have been sent by the Prussian Government into this country to study the mining, manufacturing, transportation and other industries. About 50 of them in one party expect to visit Nevada county during the month of December.

THE new water-jacket smelter at the Reno Reduction Works has been fired up. Everything worked well. All the machinery at the works is run by water power. The smelter is from 35 to 45 tons capacity, and is of the most approved make. There are on hand about 5000 tons of material containing gold, silver, lead and other metals to be smelted, also immense piles of coke and limestone, the latter being used for flux. It will soon be determined whether the smelter is a success.

THE feeling that lead has reached bedrock and can go but little lower anyhow has much to do with the feeling of confidence that is still present in the Coeur d'Alene, says the Spokane *Review*. None of the mines would work under any considerable reduction from the present quotations, but a material raise will within a short time double the working force at least. On the other hand, a failure to realize better prices, it is feared, will result in serious curtailment of the present working force.

A CORRESPONDENT, referring to the law suspending assessment work for the present year, wants to know if a co-owner who has already performed his share of work cannot compel his co-owner or co-owners to reimburse him pro rata. Probably not. The law exempts all owners from any obligation to perform work, and if it has already been partly performed by one partner, he will, we think, find some difficulty in enforcing a legal claim against his partners. However, it is a question which the courts might decide differently.

UP to the present time there have been put to work at Aspen, Col., under the new scale of wages some 500 miners, so that the total number of men now on the pay-rolls of the eight to ten big companies is not far below 1000. There is considerable talk of the Argentum Juniata resuming operations in order to do a large amount of dead work at the reduced cost of mining. This property and the Deep Mining Company have been at war for a considerable time. The resumption of operations would mean the employment of at least 200 men.

IT has finally been decided to use petroleum prepared for the purpose as fuel in all the big furnaces that are to be used for heating the buildings at the Midwinter Fair, and for the gen

eration of power, and the furnaces will shortly be erected for that purpose. In this the management is following the example set at Chicago, where it was found absolutely necessary to obtain a smokeless fuel in order that soot might not deface and spoil the white beauty of the buildings. The oil will be run right to the ground in tank-cars and piped thence to the reservoirs, from which it will be drawn to the furnaces; and, as it is produced in California and is much cheaper than coal, the saving will be a material one to the fair management. The oil has not been contracted for yet, but will probably be drawn from the wells about Santa Paula.

TIPTOP, ARIZ., heretofore a prosperous mining camp, has been abandoned. It was a chloride camp, and yielded $50,000 to $100,000 yearly. A company was organized last spring to work properties in the district on a large scale, but gave up the enterprise two or three months since on account of the low price of silver, and the camp has been totally abandoned. Where six months ago was a prosperous little village with a school, store and the hum of industry, to-day nothing is left but two lonely individuals who remain to look after the property.

THE estimates of railroad agents in regard to the number of visitors to be expected at the Midwinter Fair vary considerably. At the S. P. headquarters there is a general feeling that there will be at least 250,000 strangers in the city for a great portion of the time. On Montgomery street, and that part of Market street devoted to railway ticket offices, there are some so enthusiastic as to place the guess at 500,000. Others still more generous in their speculative figure go to the top notch of 1,000,000, though they all confess that they do not expect so great a crowd all at once.

Mines of Eastern Placer.

TO THE EDITOR:—A recent trip among the mines of eastern Placer gives evidence of greater activity in quartz and gravel properties than has been shown for years. There are numerous quartz mines at present being operated with profit, while almost innumerable ledges exist, many of which were worked, in a measure successfully, by the crude methods of early times, and which now only await capital and the improved methods of working quartz. In eastern Placer, however, gravel mining will continue to be the leading industry.

When compared to the vast quantity of gravel workable by the drifting process, which lies in the lava-capped ancient river channels of the Forest Hill and Iowa Hill divides, such valuable drift-mining properties as the Gray Eagle, Mayflower, Breece & Wheeler, Hidden Treasure, Mountain Gate and Red Point mines only amount to a fair prospect of the channels, and it is only then that some idea can be formed of the magnitude of operations which may be carried on in this district in the future.

Following is a mention of some of the properties in eastern Placer:

The Mayflower gravel mine, near Forest Hill, has a regular working force of one hundred men, and I understand the number will soon be increased. About seventy cars of cement gravel is the daily product of the mine and the twenty-stamp mill is running at its full capacity.

The Dardanelles mine, at Forest Hill, owned by Gen. Jo. Hamilton, of Auburn, is at present working but ten men. The channel had been lost for some time, but on November 1st some very rich gravel was found and the present prospects are very flattering. Their ten-stamp mill is now running twelve hours per day. The Dardanelles is the only mine on the Forest Hill divide that is equipped with an electric plant. The mine is lighted and the drills, pumps and hoisting works are run by electricity. The use and application of electric power has been a thorough success in the mine.

The old Paragon mine, now known as the Breece & Wheeler, at Bath, two miles above Forest Hill, is still being worked with profit. The superintendent is working thirty-five men, and the ten-stamp mill crushes gravel twelve hours per day.

Among drift gravel mines the Hidden Treasure mine, located at Sunny South, takes the lead. It is operated on the most extensive scale of any drift-mining property in the State. A total of 160 men are employed, and on the day your correspondent visited the mine 570 carloads of gravel were taken to the dump. The gravel is of low grade, but it is free-washing and the upper sluice boxes are cleaned up daily. As an example of the amount of work accomplished in this mine, 74,000 pieces of heavy timbers, independent of logging, are piled near the main tunnel and they are expected to last only until the first of next June.

The Dam drift gravel mine, three miles above Sunny South, is working a small force of men with very fair success.

A visit to the old and well-known mining town of Michigan Bluff showed quite a revival of interest in properties in that locality. Mining litigation, which is the curse of every camp, has tied up some of the best properties, as well as much territory that has not been thoroughly prospected. Following is a mention of some of the claims at or near Michigan Bluff:

The Ontario quartz mine, owned by E. Polifka, Wm. Stuart and C. A. Knopfel, shows a fine ledge. No work is being done at this mine at present.

The Daniel Webster quartz mine has a well-defined vein that can be traced for miles. The ore was worked in early days by the arrastra process, but a mill has never been erected to work the property.

The Manhattan gravel mine, two miles above Michigan Bluff, is being pumped out through the old Weske tunnel preparatory to resuming work upon the property.

The Bowen gravel mine, adjoining the Weske, is working a force of 12 men, and is paying well.

John Mutchler, who owns the Mutchler drift mine, formerly known as the old Franklin, is running a bedrock tunnel.

Several men are engaged putting the Gorman gravel mine in shape to work this winter.

James Tickell, who owns the Bendago drift gravel mine near Sunny South, has just finished running a new prospect tunnel, which has reached the channel. He has breasted some fine gravel, and will be ready for work in the mine next month.

The Central drift mine, near Deadwood, is at present working ten men, and the force will be increased when water becomes more plentiful.

Miners in the neighborhood of Deadwood and Last Chance, to the number of 40 or 50, are operating small drift mines on a small scale with very good success.

The gravel mine at Red Point, owned by the Mines de Lexington Company, is in a prosperous condition. The main tunnel of this mine, as is well known, was driven from a survey made by the well-known civil engineer, Ross E. Browne. The black gravel was reached a few feet above the bed of the tunnel, and the company is working upstream in the channel with excellent success. At present 64 men are employed, who mine an average of 110 cars of free-washing gravel per day. Superintendent Hoffman recently made a trip to San Francisco to purchase a water wheel, which will enable the company to operate the blower by water power instead of steam.

The Eureka mine, owned principally by F. Chappellett, is located on the east side of the divide from the Red Point property. A bedrock tunnel is being driven to tap the channel from the lowest part of the property, to enable them to work upstream.

The New Brazil Company has run a tunnel from Black Canyon into what is known as the Whisky Hill channel. The tunnel was too high, and they have made an air shaft, and will run upstream until they strike the bed of the channel.

The well-known Mountain Gate gravel mine at Damascus is not being operated at present. The owners are negotiating with parties who expect to reopen the mine and work it on a percentage.

D. W. Osborne, owner of the Osborne quartz mine, near Indian Springs, has opened the mine. He has a slope of 200 feet, and the mine is now ready for a mill.

The Page mine is a quartz property just below Last Chance. They have a ten-foot ledge and there are thousands of tons of ore in sight, but it is not of a very high grade. A two-stamp mill is operated for prospecting purposes.

The Sailor Canyon gravel mine, owned by a San Francisco company, will soon be in active operation. A bedrock tunnel has just been finished which taps the channel, and they are now engaged in getting the sluices and dumps ready for work.

The Theodore Winters quartz mine, which was recently sold to Montgomery, the Salvation Army man, is an immense 50-foot ledge of great promise. This mine will be worked exclusively by members of the Salvation Army. They have been engaged all summer grading a wagon road to the property on which to take in their machinery and supplies. The Army go through with their regular drill and devotional exercises each day. The scenery in the canyon is very fine, and the immediate section is replete with grassy flats and beautiful places for homes.

At the Flat Ravine gravel mine, on the south side of Bald Mountain, which is owned by Davidson, Jeurgensen & Co., a 1500-foot tunnel has been run which is too high. They expect to reach a level from which they can work the channel by extending the tunnel about 300 feet up grade. The gravel, which has been prospected by means of a shaft, promises well.

A half-dozen miners work around Bald Mountain at ground sluicing. The section always pays well, especially in the spring when water is plenty.

At Deadwood the property formerly known as the Davis mine, now owned by Frazil & Co., has a force of 12 men at work. The gravel is very rich, but they are obliged to work it on a slope. The mine is drained through the Elkhorn tunnel and cannot work more men on account of the slope.

Five men are now engaged at the Bishop drift gravel mine at Last Chance.

The Caledonia gravel mine at Last Chance, owned by Dixon, McCarty & Co., has paid well in former years, but they struck a lower channel. This has been reached, however, by a new bedrock tunnel. The mine is at present working but four men.

Perhaps the best-paying quartz property in eastern Placer is the Pioneer, or Lynn, mine, near Damascus, owned by James G. Fair and A. E. Davis of San Francisco. The mine is operated under the superintendency of D. J. Sullivan, who is at present working a force of forty-two men.

From thirty-five to forty tons of ore are mined each day. Their lowest working tunnel is 2300 feet above sea level. A twenty-stamp mill, which is in constant operation, is located in the canyon 600 feet below the tunnel. The mine has been a steady dividend-payer for the past twenty-five months.

Adjoining the Pioneer on the north is the Golden Cross quartz mine, owned by Richard Dorer. The mine has fine prospects, but the owner has not sufficient capital to work it.

Next to the Golden Cross is the Southern Cross, the property of Ford & Bentley. Parties from San Francisco contemplate building a wagon road to the mine and putting in a twenty-stamp mill.

The Dorer quartz mine, seven miles southeast of Towles and owned by San Francisco parties, has been leased by Placer county men, who have a ten-stamp mill in operation.

The Central quartz mine, owned by the Dorer Bros., shows good ore, but it is not being worked at present.

The Big Dipper gravel mine at Iowa Hill is at present working forty-six men. Two months ago they put in a new ten-stamp mill and they are now engaged in running a new bedrock tunnel. This mine has been paying dividends for the past two years.

The famous Morning Star mine at Iowa Hill is working its usual force of men. The amount and frequent payment of dividends is a matter of which the public is well acquainted.

IVAN H. PARKER.

Auburn, Cal., Nov. 20, 1893.

Lixiviation of Low Grade Silver Ores.

Extract from description of work at Pumactes Amalgamated Mine, Australia, in *Australian Mining Standard*.

Under the present conditions a 70 per cent extraction of the silver is obtained, the tailings just running about four ounces of silver. Any higher grade of ore treated would give a much better percentage of extration and so bring out a feature of great importance in such ore treatment.

Per ton the costs are as follows:

	s.	d.
Roasting—Material	7	0
" Labor	4	7
Lixiviation—Material	4	0
" Labor	2	0
Initial, final, trucking, handling	1	8
Total cost	19	3

More details I could furnish, but these are sufficient to show the comparative cost of the treatment with one single furnace, and I have no doubt that if two furnaces were in operation the costs of a double running capacity would not or need not be over 40 per cent additional. The present furnace could not well do more, as with any increase in the quantity, the chlorination quickly goes down. The company have plenty of available steam power, and water in the surface dams and in the mine; but, unfortunately, it must be admitted silver at 2s 9d is not too encouraging. The total cost of the present plant erected was £3300. The roasting cylinder cost £300, whilst ten vats were cheaply secured for £150. The mill, though compact, is built on the site of the old works, and to some extent this has not proved a good condition. Elevation, however, so essential, has been provided for; practical extension of the plant can be carried out at any time, and a good dumpage is secured for tailings. When the plant was projected silver was 3s 2d per ounce. The estimates of working were based on that price, and allowed a profit, but with the metal at the present price the profits are about obliterated. There is at the mine surface over two years' run for the plant, if the price of silver improves at all. Every difference of 1d per ounce of silver would make a difference to the company of £16 per ton of sulphides silver sludge.

In the matter of economic ore treatment the foregoing is of more than passing interest, and especially so at the present moment, when silver is low in price and lixiviation in the colonies has not met with much success; but evidences are not wanting of its applicability in many cases, and success is only to be assured when it is dealt with in a practical way. This class of work is so different to ordinary milling; few hands are to be seen, and when once the ore is properly understood and dealt with, the work gives little trouble and runs on in a comparatively insignificant manner.

The Mercur Mining Company's Cyanide Mill.

Louis Janin Jr. contributes an article to the *Engineering and Mining Journal* on the working of the cyanide process at the Mercur mill, Utah. It is of interest wherever the cyanide process has been tried on the Pacific coast, and is reprinted with illustrations:

The Mercur Mining Company's cyanide mill, some details of which are shown in the accompanying illustrations, is not a model plant, but the interest excited by the successful operation of the cyanide process there makes reference to it of more than passing value. The mill was not built for a cyanide plant, nor was the mine originally thought to be gold-bearing. When the Mercur vein was discovered, it was believed, as its name would imply, to be a deposit carrying quicksilver. Indeed it does; but not in sufficient quantity to make the extraction of that metal profitable. Finally the ore was found to contain gold in paying quantities, although finely disseminated in the gangue. Then a pan amalgamation mill was built, as the ore could not be worked by the ordinary process of plate amalgamation. It turned out later that the pan mill could do very little better, saving not over 40 per cent, it is said, the gold being very fine, while some of it existed as a mere coating on magnetic oxide of iron. Then, too, the nature of the gangue, which contained considerable silt, placed difficulties in the way of successful work. After this failure the plant was closed, and the owners began to look around for another process. After listening to the claims of various inventors, a quantity of ore was sent to Denver for experiments with the cyanide process. Here the results were so good that the Mercur people were encouraged to alter their plant to a cyanide mill. That the mill as it stood at the time the photographs were taken was not so convenient in arrangement as it might have been was due to its construction for another process, and really the work that has been done there is highly creditable from a metallurgical and from an economical standpoint when the numerous disadvantages are considered.

In the first place, the crushing is coarser than it should be. The rolls are not adapted for evenness of product. There are two sets to treat the ore which has passed a Dodge breaker, the primary ones being set to one-half inch and the final to one-quarter inch. Over 20 per cent of the final product which is sent to the leaching tanks refuses to pass a one-quarter inch mesh, while the nature of the ore prohibited fine crushing; such a coarse reduction was not advisable. Sizing trommels would have prevented the formation of an excessive quantity of slimes and would have furnished an even product which would have been leached to a much higher percentage than was then possible. The really unprecedented results which were obtained at the Mercur mill from this coarse ore gave rise to an opinion—erroneous, it is needless to say—that fine crushing was not necessary for the cyanide process; that the solution had the happy faculty of penetrating the gangue and carrying off the gold in its outward passage. Several mills were built under this mistaken idea, which have not been so successful as they otherwise might. It is hoped that millmen are now thoroughly disabused of this opinion.

After the ore has passed the rolls, it is carried over the vats in cars and is then discharged. In a properly constructed mill—one built to be worked with the utmost economy—this delivery to the vats would be automatic. Conveyors would take the ore after passing the screens and discharge it into hoppers over the tubs. The tubs themselves are too small. Their dimensions are: Diameter, 12 ft. 8 in. and depth to false bottom, 35 in. This gives a capacity of about 14 tons when the vat is filled to within 6 in. of the top. The diameter of the vats should be increased, but not necessarily the depth, since the capacity for leaching in a given time increases in the direct ratio of the surface areas, while increasing the depth increases the length of time necessary to leach a charge in direct ratio to the increase. Beyond certain limits, increase in either diameter or depth is not practicable, but tanks holding 25 to 50 tons are within the limits of economical and convenient work.

As would be expected from the crudity of the crushing at the Mercur mill, the time of leaching necessary to extract all of the gold that is possible varies greatly. It ranges between 10 and 240 hours. Such wide extremes cannot be due to the nature of the ore alone, but to the differences in mechanical condition. It is claimed, moreover, that the ore is singularly constant in quality and value. The precipitating boxes, which are shown in the illustration, are 40 feet long—one of wood and the other, slightly larger, of iron. Through these boxes the solution from the tanks passes constantly, and is returned to the solution stock tanks, where additions of cyanide are made to bring it up to the proper strength. After the ore in the tanks has been leached sufficiently, the tank is allowed to drain. However, a considerable quantity of solution (about 400 pounds to the ton, or with the 0.25 per cent solution used at the Mercur, about one pound of c. p. potassium cyanide to the ton of ore) remains in the tank. Of course it is imperative that as much of this as possible should be saved. To dislodge this, wash-water is used, either plain water or by a system employed at times weak solution resultant from washing. In the latter case the weak solution is stored in separate tanks, and this arrangement allows washing with a minimum increase or wastage of solution.

The auriferous precipitate at the Mercur is remarkable for its high contents in lime, as it carries 36.7 per cent $CaCO_3$. The ore is highly calcareous, but so great a solubility of limestone in cyanide as this would imply is to be doubted; it is probably due to mechanical causes, finely divided ore being carried in suspension into the precipitating boxes, where it settles. This, of course, would make the precipitate difficult to handle did the company attempt to refine it on the spot, but as it is shipped to smelting works the latter have to contend with this difficulty.

The smelting works pay a very fair price for the gold. They allow $20 an ounce, less express charges of 12 cents

THE CYANIDE PROCESS AT THE MERCUR MILL—THE ORE TANKS.

The gold in the precipitate thus netting $19.88 per ounce Troy.

The extraction at the Mercur has varied. When the mill was first put in operation it was considerably below 70 per cent, but as experience with the process increased the results became more encouraging, until now, I am informed, the average return is between 85 and 90 per cent. The mill has been enlarged recently, and better results are anticipated both as to extraction and cost. The cost during an early period of work is given at $2.40 per ton, divided as follows: Potassium cyanide (1.27 pounds), 66 cents; zinc (0.55 pound per ton), 5 cents; labor (seven shifts per 24 hours, six day and one night), $1.12; supplies, repairs, fuel, freight, 57 cents; total (not inclusive of office expenses, royalty and superintendence), $2.40.

Since this period the expenses have been reduced as the amount of cyanide lost per ton has been diminished, and a larger quantity of ore is reduced with the same amount of labor.

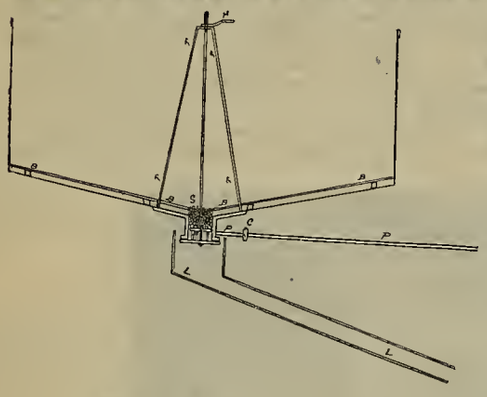
The Mercur mill was the first one in the world to treat ores (as distinct from tailings) with commercial success. It has been a pioneer, and the efforts of its owners and managers should be appreciated. The figures of costs and results undoubtedly could be improved upon on a new plant, but, all things considered, they are highly creditable.

Improved Tanks at the Sultana Mine.

Written for the MINING AND SCIENTIFIC PRESS by Frank Alderman Garbutt.

A brief description of some tanks erected by me at the Sultana mine may be of benefit to such of your readers as are interested in the cyanide process:

These tanks, ten in number, were of steel, coated inside and out with a mixture of asphaltum and coal tar. The covers which were made as tight as possible were of matched pine. The novel feature lay in the manner of discharging the pulp, which was through the center of the bottom, the tanks having a conical bottom to facilitate this



CYANIDE TANK AT SULTANA MILL.

operation. The false bottoms were made of wood, in seven sections for convenience. The closure to the opening in the bottom was operated entirely from above.

The dimensions were as follows: Diameter of tanks, ten feet; depth of tanks at rim, four feet; depth of tanks at center, five feet; diameter of discharge opening, eight inches; fall of bottom, one foot in five. The lixivium was drawn off from the lowest portion.

I am not aware of any tanks similar to the above having previously been used in the cyanide process; in fact, as far as known, the design is novel. I can vouch for the utility of the design, however, as it is the result of a practical development of Mr. Paul's published method of discharging through an opening in the side of tank.

In my first tanks I practiced what I then considered an improvement in the side opening, by locating the discharge in the bottom. On discharging these tanks it was obvious that placing the opening in the center would be a still further improvement. This was found to be the case in the next tanks I had occasion to erect, and it was while operating these that these conical bottoms suggested themselves. Their advantages are ease and quickness of a perfectly clean discharge, increased leaching rate, together with cleaner and more rapid washing.

Frazer & Chalmers in their new number 4 catalogue describe a flat-bottomed wooden tank with a conical-shaped false bottom, discharging through the center of the bottom, which is an improvement on the old method, though lacking some of the features of the conical-bottomed steel tanks, which are as great an improvement over the old tanks as are the porcelain filters over the old wooden box. I believe the porcelain filters, for which credit is due Mr. Paul, to be the greatest mechanical improvement which has been made in the cyanide process, and any one who has had any practical experience in handling the process knows that there is as much room for improvement in the mechanical, as there *usually* is in the chemical, handling of the process. FRANK ALDERMAN GARBUTT.

Los Angeles, Cal., Nov. 7, 1893.

Cyanide at the Poorman Mines.

The workings of the cyanide process at the Poorman silver mines, Colorado, are shown in the following letter to the Gold and Silver Extracting, Mining and Milling Company, Denver, Colo.:

DEAR SIRS:—Your favor requesting information relative to the working of your MacArthur-Forrest process on the Poorman ores has come to hand.

We first started our mill on the Poorman dump ore, which will run from 10 to 30 ounces of silver per ton, and will average about 20 ounces per ton. After running about three weeks on this grade of ore we made a clean-up which showed that we had extracted 85 per cent of the value. Since then we have been running on our second-grade ore taken from the mine, which will average about 50 ounces of silver per ton, and are saving close on to 90 per cent of the value. The ore consists of stephenite, argentiferous galena, metallic and carbonate of iron, lead, sulphur and an occasional per cent of copper. I am pleased to give you this testimonial, as I am highly pleased with the success your cyanide process is having on my ore. Yours very truly, (Signed) N. D. MCKENZIE.

The Poorman silver mines of Colorado, limited.

Studies in Gold-Milling.

NUMBER VI.

Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.

The principal waste products of gold mills deserve investigation, as a full knowledge of the tailings and slimes in all their conditions is essential to the millman. Many obstacles present themselves in their examination on account of their bulk and the difficulty of concentrating samples without loss of gold. Tailings may be carefully concentrated and examined under the microscope with or without previous thorough grinding as already described, but for the finest slimes recourse must be had to fire assays after very careful sampling. The testimony of the microscope confirms the loss attending concentration without sizing, as often large percentages of heavy sulphides, arsenides, tellurides, etc., are found in the tailings from the best belt concentrators, and always in an extreme division, the size of grain varying from 1-1000 to 1-2500 inch. Where the loss is in metallic gold the coarser tailings generally carry the highest value, while the reverse occurs with slimes both from hard pyritous and oxidized decomposed ores. The distinction between sands and slimes is indefinite as not depending on size of grain alone, as a hard, tough rock will give sands even with 1-1000 inch size of grain, while slimes will form from soft talcose ores and many metallic oxides when much of the material is 1-500 inch in size.

Tailings from chlorination works give evidence of a loss in gold, resulting from fusion of the sulphides in roasting and from insufficient leaching, as well as the occurrence of larger gold particles in the concentrates.

The practice occasionally met with of dumping a mass of almost barren rock into a gold mill cannot be too much condemned, as injury must result to the treatment of the average pay ore. On the contrary, the custom generally followed in Europe, and to some extent in the Eastern States, of sorting the ores at the month of the tunnel, could in many instances be adopted here with advantage, as in many mines certain portions not only of walls and horses, but in the vein matter itself, are found barren, and can with almost unerring certainty be selected by the experienced sorter.

In the sorting and cleaning of his ores, the gold-miner could with advantage study the methods now followed by the coal-miners of the Eastern States. Thoroughness, combined with economy, should be his aim, not cheap mining and milling, which often means but carelessness and waste of gold product. The generally unauthentic statements of cheap mining and milling are, when investigated, often found to be exaggerations of peculiar conditions, and are, as a rule, misleading and injurious both to the miner and the investor. Even now but comparatively few gold mines and mills are so conducted as to be able to present clear and reliable statements of cost of mining and milling, percentage of recovery and of waste for any long-continued period.

Idle mines and silent mills, often with costly and unsuitable machinery, attest the errors of both miner and millman. Wealthy corporations and individuals may afford costly and ill-advised experiments and finally reach even a phenomenal success. The great number of small mines, often managed by the owners, and depending chiefly upon their personal skill and energy for successful development, form an important element in gold-mining, as they furnish the prospectors and explorers of the industry, and if judiciously handled often become great and permanent mines.

To these we may look to rehabilitate the gold-mining industry by a close study of natural laws, by persistent and intelligent effort, by the aid of all available teachings of science, pure and applied, and not least by prompt and systematic co-operation; and it is to these chiefly that the writer offers the preceding studies in gold-milling as his contribution to the permanency and progress of the gold-mining industry. J. A. EDMAN.

Meadow Valley, California, Nov. 8, 1893.

Sinking Shafts Through Quicksand.

M. A. Gobert, a Belgian engineer, has devised an improvement upon the Poetsch process of sinking through water-bearing strata and quicksand. The Poetsch method consists essentially of freezing by passing a current of cold air or a liquid cooled below the freezing point through tubes driven into the soil to be frozen.

Gobert substitutes for the incongeable liquid of Poetsch's plan cooled down below freezing point, liquid anhydrous ammonia, which is sent into the tubes at a temperature above freezing point. The ammonia vaporizes in the tubes, producing an intense cold, which freezes the water-bearing measures or quicksand outside. Moreover, the same ammonia is used indefinitely, being made to circulate through the tubes by a forcing and compressing pump, which therefore constitutes with the tubes a complete refrigerator, thus leading to a considerable saving in plant, and the cold produced is more intense than that obtained with an incongealable liquid cooled down below freezing point. A great advantage claimed for this method is that the pressure inside the tubes can be varied so as to slightly exceed that of the outside pressure due to the height of the liquid column. It has been found by experiment that a temperature of —35° C corresponds with a pressure of 0.9 atmosphere; —32° C with the atmospheric pressure; 30° C with 1.15 atmospheres; —25° C with 1.46 atmospheres, and 20° C with 1.84 atmospheres. By working with a temperature of —32° C the pressure of the gas is equal to that of the atmosphere, and there is, it is claimed, no fear, even in the event of a crack or want of tightness in the joints, of the ammonia oozing out into the soil. As it is easy to ascertain the level of the water around the tubes, the pressure inside them can be regulated in accordance. The tubes are closed at the bottom and have two necks at the top, one for receiving the pipe which introduces the liquid ammonia, and the other that by which the gas is taken off to be again condensed into liqnid. The joints have hitherto been made by screwing one length of tube into another, a practice which fails to secure tight joints, and also weakens the tube at the joint, so that they often break off there when withdrawn from the soil after having served their purpose.

Mr. Gobert has also made an improvement in this respect by threading the ends of the tubes internally so that they can be screwed upon a ring, thus preserving almost the full thickness of metal, while at the same time leaving the outer surface uniform for easy withdrawal. The ends of the tubes are turned, not perpendicular to the sides, but leveled or hollow curved like the gland of a stuffing-box; and for the larger sizes of tubes a flange of dovetail section is formed on the joint-ring. The effect of this arrangement is to produce two grooves, of interoal dovetail section, between the dovetail flange of the ring and the ends of the tube lengths, to receive lead or other washers, which are compressed tightly by the screwing up, thus forming a perfectly tight joint. For the smaller sizes of tubes, the flange of the joint-ring is dispensed with, the ends of the tubes, however, being turned with a bevel, or convex or concave bevel surface, thus forming a single dovetail groove for receiving the lead or other washer.

British Columbia Mines.

Mr. Hepburn Prentice, the mining expert, late of Australia and now in this city, has just returned from a trip through the Kaslo-Slocan and other British Colnmbia mining districts, and Baker City, Oregon.

"There was not much activity in the Kootenai country when I was there," said Mr. Prentice. "Kaslo, which recently had a very great hoom, was exceedingly quiet, and had, in fact, lost a large part of its population. I understand, however, that it is again beginning to take on life, and people are again going in. The mines are producing, notwithstanding the depression in the silver market. The formation about Kaslo is slate, lime and porphyry, and the ledges, which are quite large—as much as eight feet—are of pure galena. The shoots are long and large. The galena is 60 per cent lead. Roughly speaking, it gives 150 ounces of silver, on an average, to the ton. There are numerous instances of several hundred ounces and occasional of one thousand. So yon see that, despite the low price of silver, the mines can be operated at a profit. The ore, carrying such a high percentage of lead, is in demand for smelting, and is shipped to Tacoma, San Francisco and Great Falls.

"I spent a short time in the Okanogan (British Columbia) fields, at Fairview camp. Some of the gold properties are doing well. The ore is low grade and the ledges large.

"I was at Boundary Creek for awhile. There are quite a number of large ledges there, mostly copper, with silver and gold. The ore is low grade, with refractory sulphides. The camp is dnll. A railway and machinery are badly needed. The ore is now bagged and shipped out 60 miles to Marcus, on the Spokane & Northern. There are quite a number of undeveloped properties worth looking after.

"I had no opportunity to see a great deal at Baker City, Or., as winter was coming on and snow was beginning to appear in the mountains. I was favorably impressed with the country, though, and I am convinced that Baker City has a fine future. The mines are both placer and quartz, and are located east, south and west of the city. I visited the Virtue mine, eight miles east of Baker City. They have lately been working in some very good ore, but its value is not made public. I was also at the Maybell and White Swan, in the same vicinity. Both are good properties."

Mr. Prentice was invited to make a visit to the newly-found Alberni district, on Vancouver Island, B. C., but, from what he heard at Victoria, he was not favorably impressed and did not go.

Desquamation and Decay of Rocks and the Formation of Bowlders.

IN THREE PARTS—PART III.

Written for the MINING AND SCIENTIFIC PRESS by Henry G. Hanks, F. G. S. A., F. G. S., ex-State Mineralogist.

Spallanzani (Travels in the Two Sicilies, English Translation, London, 1798, Vol. I, fol. 236) during his ascent of Ætna in 1778 met with some substances of a spherical figure which he thus describes: "In the midst of this immense quantity of scoria, in several places I met with some substances of a spherical figure, which, like the lava, were at first small, but increased in size as I approached the summit of the mountain. These were originally particles of lava ejected from the crater in the eruption mentioned, which assumed a spherical form when they were congealed by the coldness of the air. On examining them I found them in their qualities to perfectly resemble the scoria, and to possess the same magnetism."

From my experience and observation I am led to the opinion that they were really weathered bowlders of lava such as I have seen in Butte county, California, and at Tucson in Arizona.

De Luc (Geological Travels in Some Parts of France, Switzerland and Germany, Vol. II, London, 1813) makes references to the formation of bowlders, and distinctly says that they were neither brought down by rivers, nor are they rounded by running waters. I select the following: "The granite of the greater part of these mountains is subject to decomposition by the action of the air, a decomposition which begins on the angles of the masses, where all these causes have the most power, and continues along the surface as the latter is laid open, unless, from the nature of the granite, which differs in the degree of hardness and tenacity of the ingredients, or from its particular exposure, it happens to be overspread with lichens. This is the source of the granite sand wherewith, as will be seen, the whole country is here covered, and as for the blocks on such rapid slopes as that I have just described, they, being already *rounded* by these actions of the air, slide by their own weight down the sand, whenever after great rains it is fully imbibed with water. From the spot where we stood I pointed out to Mr. Schaul on the opposite side not only clefts similar to that affording a passage to the Zackel with *rounded blocks* on their slopes, but distinct rocks which were composed of masses in strata nearly horizontal certainly still occupying their original situations, though reduced by the erosion of the angles of each mass into blocks apparently separated and piled on each other." (page 510.)

"As for the rounding of the edges of these large blocks, Mr. Preller agreed that since they were all fragments of strata, and since, consequently, their superficies exceeded their thickness, they could never have rolled, but must have slidden on the flat side, and that, therefore, this rounding could not have proceeded from any other cause than that to which I have assigned it; namely, the decomposition of the angles by the action of the air." (p. 540.)

J. MacCulloch published an elaborate paper (London Quarterly Journal of Science, Literature and Arts, July, 1822) "On the Desquamation of Certain Rocks and on Its Connection with the Concretionary Structure."

In this paper the author shows that many of the rocks of the trap family undergo a process of desquamation after long exposure to the air, and are thus gradually resolved into crusts which continue to fall off in succession and at last moulder into clay. Having met with some remarkable instances in which this effect was decidedly independent of any concretionary structure, he was led to specially study the subject, the results of which appear in his paper.

No stratum of clay or decomposed matter was in any instance found at the place where the crust separated from the solid block.

He found that the desquamation of prismatic or cuboidal masses of granite rock took place all round the surface respecting some imaginary point of center, and promising in the progress of time to reduce the whole to a smaller or spheroidal mass.

In "Additional Remarks on the Desquamation of Rocks" the author announced that he had found the same conditions in connection with other rocks than granite and members of the trap family. It was evident therefore that in one instance cited, the desquamation was not produced by the peculiar structure of the rock, but was utterly independent of it.

"Under the same circumstances it might equally be expected to occur in a mass of pure quartz or mica schist of a more simple and homogeneous nature, and in the latter case the schist might desquamate at angles to its fissile tendency. Such an occurrence might excite surprise, but there is no apparent reason why it might not happen in either of these rocks in a separate state as it does when they are intermixed with distinct laminæ."

Buckland (fol. 252) noticed chalk flints collected together at different localities in England. "Immense deposits of gravel occur occasionally on the summit and slopes of the hills, and almost invariably universally in valleys over the whole world in situations to which no torrents or rivers that are now in action could ever have drifted them." (Fol. 227.) (I have myself seen similar deposits, not only in that country, but also near Havre in France. Being harder and therefore better able to resist the forces which disintegrate softer chalk, they have become collected as seen.)

Hibbert (History of the Extinct Volcanoes of the Basin of Neuwied, on the Lower Rhine, London, 1832) describes balls of grauwacke assuming the structure of basalt. These balls are in general so perfectly rounded as to appear the produce of art. In their interior they are of a firm consistence, but near their surface, owing to the diffusion of the oxy-hydrate of iron, they peel off in concentric scales.

Prof. H. D. Rodgers (Geology of Pennsylvania, 1868, Vol. II, part 2, fol. 992) observed the operation of this law in the anthracite croppings of his State. "Every bed of tollerably pure hard anthracite displays at its outcrop and to a small depth below, a prevalence of the ovoid and globular shapes in its loose and weathered lumps. This is a consequence of the tendency to the conchoidal fracture and of that exfoliation and peeling off at the corners and edges which results from alternate wetting and drying and which belongs to nearly all homogeneous earthy aggregates which are similarly exposed to the weather. When the coal is finely laminated and uniform in texture the form resulting from long weathering is ovoid, but when the mass is very homogeneous and cubical on its joints, the shape approaches near to the globular."

Because bowlders are almost always present in the beds of mountain torrents, an almost universal opinion prevails that they are caused by the forces of the stream. My experience convinces me that this is an error.

If a mountain stream, in the bed of which there were many bowlders, could be diverted from its channel and forced to cut a new one, bowlders would soon appear as the waters cut deeper into a soft bedrock or alluvial deposits, and increase in number, although none of them would be the production of the new river, but washed already formed from the banks, and only seemingly collected in the bed because lighter and more easily disintegrated mineral matter had been swept away by the rush of waters.

Referring to the photograph which accompanies this paper, the small globular bodies marked No. 3 were produced by dipping angular fragments of common clay into water and setting them aside for a time, when meniscoid

BOWLDERS IN THE HANKS COLLECTION.

scales separated. This was repeated several times, and the imperfect spheres were the result. No. 1 is a natural squamos E-bowlder from Shasta county. Nos. 2 and 4 are small weathered bowlders of igneous plutonic rock, which I obtained on Sentinel hill, near Tucson, Arizona. No. 5 is a scale from a large bowlder at the same locality. The photograph is reduced to one-third the natural size.

HENRY G. HANKS.

Relocation by Junior Locator.

In a case affecting the relocation of a claim by a junior locator the Supreme Court of Colorado recently held: Section 2324, Revised Statutes U. S., provides that, on failure to perform labor or make improvements on a mining claim to the extent of $100 per year, the claim shall be open to relocation, provided that the original locators, their heirs or assigns, do not resume work before such relocation. Section 2409, General Statutes, provides that if the locator of a mining claim is desirous of taking in part of an overlapping claim which has been abandoned, he may file an additional certificate. Territory abandoned under the former provision may, under the latter, be taken by the owners of the junior location. An additional location certificate, filed by the locator of a claim for one of the purposes enumerated, need not specify for what purpose it was filed. The burden of proving a forfeiture of a mining claim is upon the person alleging it. Where the owner of a claim relocates it under a different name in order to protect his rights and to preserve the claim from location by others, until he can obtain title by deeds from the original owners, and work is done to protect the lode under both titles, such work will inure to the benefit of the original claim, as afterward deeded to him.

Working Mines in the Cœur d'Alenes.

The mines in the Cœur d'Alenes are now giving employment to about 800 men directly. This surface estimate does not include the employment contingent upon the operation of the various properties. The pay roll at present is approximately $3000 per working day, from direct sources, as against a probable pay roll of $8000 per day when the mines throughout the district are in full blast. The following table, given in the Spokane *Review* Nov. 13th, shows the condition of the 15 principal working mines of the silver-lead belt:

MINES.	Present force.	Daily pay roll.	Full capacity.	Daily pay roll.
Bunker Hill and Sullivan	215	$750	400	$1,400
Sierra Nevada	10	35	75	250
Last Chance	.....	.....	125	400
Stemwinder	10	35	125	400
Gem	120	450	150	550
San Francisco	104	400	150	550
Granite	40	150	40	150
Black Bear	.....	.....	75	275
Poorman	194	750	210	800
Standard and Banner	80	300	80	300
Mammoth	10	35	40	150
Tiger	3	30	100	375
Union	4	18	50	175
Morning	.....	.....	250	900
Hunter	.....	.....	150	550
Total	796	$2,950	2,020	$7,225

The Bunker Hill is employing in the neighborhood of 180 men in the mine and the rest of the number in the concentrator and at miscellaneous work. The ten men in the Sierra Nevada, also at Wardner, are doing prospect work. The Last Chance is waiting for a decision of the Supreme Court, and both claimants have announced their intention of working as soon as the result is made known either way. The Stemwinder has a small force working under lease.

Of the mines in Canyon Creek, there is most talk of putting the Tiger into operation soon, Superintendent Cuibertson having returned from the East, it is thought, to take charge of the work again. The Granite is at its best now. The Bear is doing practically nothing. The Poorman is working nearly a full force. Perhaps a dozen men are at work in the Mammoth, and the Union has four men doing contract work. Neither of the mines at Mullan is attempting to do anything.

Thickest Coal Seam.

Prof. A. Lakes writes to the *Colliery Engineer* relative to the thickest coal seam at present known in the world:

This is in Wyoming at Twin creek in the Green vein coal basin. It is 80 feet thick with only one thin parting of shale near the roof, and upward of 300 feet of solid coal underlies the property of 4000 acres. These seams all lie within a thickness of strata of 2500 feet. Eleven seams will average 15 feet. The dip is about 15 degrees to 20 degrees. There are very little impurities or shale parting in these coal seams. There is a 35-foot seam, an 80-foot seam, a 25-foot seam, a 40-foot seam and an 18-foot seam and some 20 or 30 others varying from 4 to 12 feet. It is suggested in the *Colliery Guardian*, from which these notes are taken, that the "working of such great seams without causing subsidence will be a matter of great mechanical interest to engineers."

At Durango, Colo., there was a coal seam said to be upward of 80 or more feet called the Mammoth seam, but in reality it was only a meeting of congeries of several seams none of which exceeded eight feet of clean coal, the intervals being occupied by numerous sandstone and shale partings.

Again at Newcastle, Colo., a very large seam of fairly clean coal was discovered upward of 40 feet in thickness, but this is far outrivaled by the great seam of Wyoming, while several other seams as we have observed in the same series rival the Colorado one in thickness.

The coal in the Wyoming seams has a dark, glossy appearance resembling cannel coal and burns with a bright flame, while the volatile matter is combustible and adds to the value of the fuel. An average analysis of these coals may be roughly stated as:

Moisture	7
Volatile matter	42
Fixed carbon	47
Ash	2

The coal does not coke. The geological horizon appears to be much the same as that in Colorado and the West generally, viz., the Upper or Laramie Cretaceous.

Mechanical Progress.

Effects of Strain on Machinery.

One of the things that most machinists have to learn is that they are not working with materials that are really "unyielding," as iron and steel are commonly considered to be, but with materials that yield readily to every strain imposed upon them, says the *American Machinist.*

It is far too common, when shaping parts of machinery, or when erecting machines, to impose strains of various kinds upon them, and assume that they do not change form on account of those strains. Instead of this, it should be more fully realized that in every case there is a change of form, depending upon the character and amount of strain, and whether or not this change of form will be prejudicial should be considered.

A cast beam, specially designed for extreme rigidity, will yield readily to a small transverse strain, as is perhaps best shown by bench-measuring machines, in which, though the bed of the machine may be what we call extremely rigid, yet a small lifting force applied to one end of it produces a very perceptible effect in the way of bringing the contact points together, an effect which is readily perceived by the present refined methods of measuring.

One of the most vivid proofs of the extreme elasticity of steel is afforded by a very interesting experiment made by Sellers Bancroft at the works of William Sellers & Co. Three cylindrical steel posts, 1½ inches in diameter and 10 feet long, were placed in a vertical position upon a steel disk, the three posts arranged in the form of a triangle. On top of these was placed another steel disk, and arrangements were made by which a pound weight could be very carefully placed upon or removed from the upper disk. An electrical contact was arranged in such a manner that any diminution of length of the columns would cause a bell to ring. It was found that this pound weight was sufficient to make and break the contact, the bell continuing to ring so long as the weight was in place and stopping whenever it was removed.

By experiments made upon specimens of the same bar of steel, and by calculation, it was determined that the steel bars were compressed 1-14,000,000 of an inch, which, it is true, is a very small amount, but then one pound is a very small load for steel posts capable of supporting over 200,000 pounds without permanent deformation, *i. e.*, within the elastic limit of the material, and the experiment shows that even the lightest strain cannot be imposed upon the materials we handle without a corresponding yielding, which yielding may or may not be disregarded according to circumstances.

To this fact that metals always yield under strain is undoubtedly due much of the "wearing to a bearing" that is often considered necessary in new machinery. Machine spindles ground and lapped accurately to a bearing while unloaded and subjected to no strain may not be to a bearing when loaded and in operation, especially if subjected to transverse strain.

Engine crank-shafts deflect by the load of the fly wheel and other strains put upon them. Surfaces scraped to a surface plate are no longer true when differently loaded, or when the weight of the machine itself is allowed to produce distortion.

To Bore Square Holes.

A machine has been brought out by the Square Hole Drilling Machine Company, limited, of 100 c, Queen Victoria street, London, which will, it is claimed, enlarge a 1⅞-inch round hole to a 2-inch square hole, with corners rounded to ¼-inch radius, in 15 minutes, the material worked being Bessemer steel, ¾-inch thick, says *Invention.* A two-inch hexagon hole with sharp corners can be produced in 12 minutes. This machine was originally introduced some time ago, but has recently been remodeled and improved.

Best Kind of Engine.

There is no rule that can be given to determine what kind of engine is best to put in to do work in every place, says the *American Machinist.* The situation and requirements must be carefully examined, the place that the engine must occupy, its size and accessibility, the cost of fuel, the facilities with which water can be obtained, in what quantity and the cost, also the horse-power to be developed, and the work that the power is used for; all factors must be considered. The horse-power required and space that is available will determine largely the style of engine, whether it be horizontal or vertical, the cost of fuel, the amount of water that can be obtained, whether it be simple, compound or compound condensing. Unless fuel is very expensive, it does not pay to compound small engines, say less than 100-horse power, nor would it pay with large engines where fuel is very cheap, or where engines are to be used a short time each year. Have a mechanical engineer to advise, give him every point that you may know regarding your requirements, and of any peculiar features that enter into the same; discuss every feature, and then let him decide which is the best to put in. The features to look for and insist upon are simplicity, strength and good workmanship, economy and durability, close regulation, and that with the requirement that it should not run away if the load by accident should be thrown off. Fancy work can be added to any machine, if required, but it does not add to its effectiveness, durability or economy. There are many good makes of engines, and when one make of engine is singled out, and has said of it that it is the best one to be bought, it is simply untrue; there are a number that one is as good as another. The requirements of the customer will decide whether it would be better to adopt one make in preference to any other. Where several makes are practically the same, strength, style and workmanship, economy and regulation, should be the standard to select from. Close regulation is more to be sought for than any other thing in cotton and woolen mills, and especially where the fine grades of yarns and cloths are made; next comes economy of fuel, but economy of fuel better be sacrificed than regulation.

New Things in Iron Mining.

The most revolutionary thing that has ever occurred in the history of iron mining in America, or the world, is now in actual progress on the Mesaba range, and is proving successful, says the St. Antonio *Express.* At the Biwabic mine, in section 3-58-16, ore loading is going on directly from the ore body, lying as nature left it, at the rate of a 24-ton car every four minutes. The ore is loaded by a steam shovel of 2-ton capacity, which is working directly ahead into the end of a cut. When the cut is completed, and the shovel is able to work sideways, the work will be easier, for there will be less distance to transverse. The shovel handles about four tons per minute, and is loading about 500 tons daily. This week it begins on a 1000-ton daily output, and shipments will be large. The ore is dry and fine grained, and is handled with much ease. The wisdom of stripping off the 30 feet of surface over the ore, which has been generally questioned, is now universally recognized. A few figures, which are now actual verities, will prove of interest. The cost of the stripping of the 30 feet of surface above the ore body has averaged five cents per ton of ore to a depth of 90 feet, and the ore is more than 90 feet deep. The cost of loading the ore from the natural bed without explosives, underground workings, air-shafts and pumping machinery, is less than four cents a ton; total mining cost, nine cents a ton; royalty, 50 cents; freight to Duluth, 80 cents; freight from Duluth to Cleveland, commission, etc., $1.35; total at Cleveland, $2.47; value of ore laid down at Cleveland this season, $3.75; ordinarily, $4.25. The cost of mining the hard ore of the Minnesota mines at Tower is stated to be $1.65 a ton, and the last Government geological report states that this company raises more ore per man than any hard ore mine in the United States. As this machine handles as much ore in four minutes as one man can in a day, its adoption in the mines all through America may be looked for.

Mechanical Wood Carving.

A mechanical system of wood carving has been patented by the Wood Carving Company, limited, of Birmingham, by means of which the decoration of wood in numerous designs can be accomplished cheaply and well. Electric light casings with their carved surfaces can be supplied, we are told, at a cost very little in excess of the plain casings ordinarily in use.

Coal Consumption on Liners.

The American liners New York and Paris burn about 330 tons of coal per day, or about 30,800 pounds per hour, and maintain about 18,000 indicated horse power, which is equivalent to a coal consumption of 1.71 pounds per hour per horse power.

Scientific Progress.

The Future of Aluminum.

The future of aluminum is a subject attracting much attention just now in technical circles. It does not exist in nature, says the London *Spectator*, in any form perceptible by the senses. There is no such thing as aluminum nugget or aluminum dust. It cannot be crushed out or washed out, or even burnt out of the earth, except with the aid of the electric furnace at a temperature of 6000° Fahrenheit; yet it is present in every load of London clay, and wherever else clay-beds lie it exists potentially in quantities and over areas to which even the coal measures cannot be compared either for richness or extent. When once obtained from the clay, its peculiar properties are more obvious and striking than those of any other material. It is beautiful to the eye—whiter than silver, and indestructible by contact with the air. It neither rusts nor tarnishes, is strong, elastic and so light that the imagination almost refuses to conceive it as a metal, the connection between heaviness and strength being almost as firmly established in most minds as that between heaviness and warmth, and refusing to admit any comparison between the comfort afforded by an eiderdown or a sheepskin. The weight is little more than one-third of the corresponding bulk of iron, and of course far less than that in the proportionate amount of silver, gold or lead.

The so-called "aluminum gold," of which watch chains and trinkets were commonly made some years ago, is merely an alloy of copper containing a small percentage of aluminum, which gave to the copper brightness and hardness, with absolute freedom from tarnish. "Aluminum bronze," the material of which the Austrian field-guns are constructed, also contains only some six per cent of aluminum, though the material so produced is of extreme hardness and value for the purposes for which it is used. But the value of pure aluminum—light, strong, non-corroding, lustrous and beautiful to the eye, inoffensive to the senses of taste and smell, and so malleable that (like gold) it can be beaten out into thin foil or drawn into fine wire—is such as to offer an inducement to the discovery of a cheap and simple method of extracting the boundless store in the clay-beds of the world, hardly exceeded by the desire to discover the philosopher's stone itself. Nowhere, indeed, does the old fancy of the transmutation of metals come nearer an apparent realization than in the change from masses of shapeless clay into white and shining blocks of silvery aluminum. Even now, with the existing methods of elaborate chemical treatment, or the intense heat of the electrical furnace, pure aluminum can be bought for 2s per pound in Germany and at 2s 6d per pound in England. Good gun metal—not the rubbish which is sold as "brass" for door-knobs and curtain-poles and other household fittings—costs 6d per pound; but, as the quantity of aluminum represented by a pound-weight is three times that of an equal weight of copper, the cost of the aluminum, bulk for bulk, is in the proportion of 9d to that of 6d for the copper. Compared with the so-called brass, it is already equally cheap and equally strong, with far greater lightness and beauty.

The present cost of aluminum, though still higher than any of the cheap metals, has brought it within the range of every-day life, and its present uses, limited as they are, necessarily bear some relation to the great question of the future of the new metal, and the possibility of realizing the hopes of the metal-worker and the engineer. For all personal equipment which must be carried by the owner, aluminum is rapidly taking the place of every other metal. Its lightness is its obvious recommendation in this case. In the German cavalry, even the stirrup "irons" are now made of aluminum. The men's water-bottles are also of the same light and strong material. In binoculars for field use, and all kinds of scientific instruments for distant and toilsome expeditions, such as Dr. Nansen's Arctic journeys, or observations on high mountains, the same metal takes the place of the heavier brass, when the saving in weight so secured may often make the difference between scientific success or failure. Nearly all the small articles of luxury and ornament usually made in silver or brass are now produced in aluminum, though where weight is not a drawback, the gain is rather one in appearance than in construction. But aluminum thimbles, pen-holders, paper-knives, flasks or cups are so far superior to those made of the ordinary materials that no one who has once made use of them in the new metal will readily return to the older form.

But it is not as a mere accessory to comfort and convenience that real development of the new metal should lie. It is for use at sea that its most marked quality of lightness obviously fits it. The marine engineer, and the naval architect, who are already looking in this direction for a reduction in the weight which is inseparable from loss of efficiency, whether in speed or cargo, cannot neglect the possibilities of a metal which, when mixed in the proportion of 1 to 50, gives to aluminum bronze a hardness and toughness which make it almost as reliable as steel, and which, if the proportions could be reversed, and the strength preserved, would reduce the weights of ships and machinery alike by two-thirds. That is a problem which awaits the metallurgists for solution. The reduction in cost, judging by analogy, can only be a question of time and research. The best steel now costs little more than ½d per pound, while aluminum is 50 times that price. Aluminum exists in far greater quantities than iron, is more widely distributed, and neither the limits of time nor the history of metallurgy forbid us to conjecture that, as the world has seen its age of stone, its age of bronze and its age of iron, so it may before long have embarked on a new and even more prosperous era—the age of aluminum.

The Earth's Interior.

The idea of M. Rateau, as expressed recently to the French Academy of Sciences, is that the phenomena of the earth's crust

are well explained by considering that the planet's interior is molten, and that a layer of gaseous matter separates it from the portion of the crust forming the continents, whereas the sea-beds sink. The gradual escape of the gases, imprisoned under high pressure, will in time exceed the production of new supplies, when the pressure will diminish and the continents fall in, giving rise to more or less crateriform configuration. This is the state in which the moon now appears. Assuming the crust to be 18½ miles thick, the pressure of the gases should be 650 atmospheres, their temperature 900° C., and their density nearly equal to that of water. This theory makes it clear why volcanoes have successively receded inland where the sea has encroached.

Sun Heat.

Those who have paid attention to this subject are aware that the remarkable doctrine first propounded by Helmholtz removed all real doubt from the matter, says Sir Robert Ball in the *Fortnightly Review*. It is to this eminent philosopher we owe an explanation of what at first seemed to be a paradox. He explained now, notwithstanding that the sun radiates its heat so profusely, no indications of the inevitable decline of heat can be as yet discovered.

If the sun had been made from solid coal from center to surface, and if that coal had been burned for the purpose of sustaining the radiation, it can be demonstrated that a few thousand years of solar expenditure at the present rate would suffice to exhaust all the heat which the combustion of that great sphere of fuel could generate. We know, however, that the sun has been radiating heat, not alone for thousands of years, but for millions of years. The existence of fossil plants and animals would alone suffice to demonstrate this fact.

We have thus to account for the extremely remarkable circumstance that our great luminary has radiated forth already a thousand times as much heat as could be generated by the combustion of a sphere of coal as big as the sun is at present, and yet, notwithstanding this expenditure in the past, physics declares that for millions of years to come the sun may continue to dispense light and heat to its attendant worlds with the same abundant prodigality. To have shown how the apparent paradox could be removed is one of the most notable achievements of the great German philosopher.

What Helmholtz did was to refer to the obvious fact that the expenditure of heat by radiation must necessarily lead to shrinkage of the solar volume. This shrinkage has the effect of abstracting from a store of potential energy in the sun, and transforming what it takes into the active form of heat. The transformation advances pari passu with the radiation, so that the loss of heat arising from the radiation is restored by the newly-produced heat derived from the latent reservoir.

Such is an outline of the now famous doctrine universally accepted among physicists. It fulfills the conditions of the problem, and when treated by arithmetical calculation it is not found wanting.

Prof. Barnard on Comets.

Prof. Barnard, of the Lick Observatory, recently gave an interesting lecture on comets in this city.

"Comets," said the speaker, "are bodies of gaseous matter, a little drier toward the middle than at the outsides. As this middle descends toward the sun it grows brighter, and a little star-like body appears and emits jets of brilliant matter, which streams out as a nebulous body and forms the tail. What before was small in dimensions extends to enormous sizes, stretching out 200,000,000 of miles. What this matter is we know not. It is supposed the tail is composed of vapor. This we are not sure of. The spectroscope does not reveal correctly or satisfactorily what they are. Hydrocarbons are found in them. When a comet passes between the earth and a star you can see the star through the comet. You think the star is in front, when it is known positively that the star is farther away than the comet. What the nucleus is composed of we know not. No astronomer has positively seen a nucleus of a comet pass between the earth and a star. So it is not certain whether this center spot is transparent or opaque. It is supposed that the nucleus is composed of meteoric stone."

☞ Our new and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the arts, sent free and free of postage to any one in any part of the world who will furnish his address.

MacArthur-Forrest Process
UNITED STATES PATENTS CONTROLLED BY
The Gold and Silver Extraction, M. & M Co.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.
GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Among the mills that have adopted the process are: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; The San Juan Gold M. & M. Co., Silverton, Colo.; The MercurGold Mining Co., Fairfield, Utah; The Union Mills Co., Tuscarora, Elko Co., Nev.; The Creighton Mining & Milling Co., Creighton, Cherokee Co., Georgia; The Moratock Mine, Montgomery Co., N. C.

Experimental tests and carloads of ore treated on request.

Cheapest and surest process yet discovered for treating many kinds of refractory ores.

Full information and literature furnished by

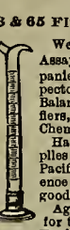
JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

$1000 WORTH OF LAW
FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, **$1.50**) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of **$1.50.**

The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts Illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Electricity.

Telephone Patents.

We still continue to receive inquiries from a great many quarters as to the status of the telephone patents, says *Electricity*, and while we wisb to oblige our readers as far as possible by answering any questions on which information is obtainable, it is manifestly impossible to authoritatively answer a number of inquiries which involve questions that are as yet undecided by the United States Supreme Court; nor can we nndertake to invent or adapt a system of telephony which avoids lnfringing all existing patents; yet it is not impossible to do so and will be less difficult on the expiration of the Bell receiver patent, next year.

In regard to establishing exchanges to compete with systems already existing in different places, operating under the patents of the American Bell Telephone Company, it is very doubtful if such an attempt would prove successful, as the established business would for many reasons bave great advantages over its rival. From the nature of the business there is hardly room for more than one telephone service in any city, as there would be naturally no connections permitted between the subscribers of the rival companies, a conditlon which would be as unsatisfactory to the subscribers as the divided service would be to the telephone companies.

In a city without this service, where a new system is to be installed, the conditions are different. The only trouble in this case would be in arranging the details of the exchange so as to avoid infringements of patents on minor points, of which there are quite a number. For example, the switch on the magnets for ringing up the central, whicb is normally closed by hanging the receiving instrument on the forked handle, is patented, and without this an extra switch would need to be manipulated. Many of the details of the central-station switcbboards are also patented, and considerable work would be involved in arranging the details of a system which would botb secure an efficient service and avoid all infringements on these patents.

Concerning the manufacture of telephone instruments there is less difficulty in the way, and for private lines there are no important obstacles in tbe way of patents which bave not already been overcome.

It is well known that the art of telephony and the Blake transmitter are public property, and tbat the first patent on the Bell receiver will sbortly expire. Tbe Edison patents and the Berliner patent relating to microphones with variable surface contact are still in force, and although tbe validity of the latter patent has been called into question, no decision on this point bas been handed down by the courts. The use of a permanent magnet in the transmitter is also patented, but this is not of much importance, as an electro-magnet may be used there with equally good effect. The variable contact microphone is also not an absolute essential, although it is undoubtedly the most convenient device that can be adopted. This can be replaced, bowever, by a microphone in which the conductivity is varied by the changes of density in the carbon or other material due to varying pressures but with a fixed contact surface. Tbis has been accomplished in various ways, among others by the compression of a carbon spiral.

As the matter stands now, telephones of the pattern at present used by the Bell Company cannot be generally manufactured, but enough of the patents on tbese instruments have expired to permit the free manufacture of very serviceable and effective instruments for this purpose.

Telephones in Chicago.

The Chicago Telephone Company now makes claims to having the most complete, as well as the busiest, telephone exchange in the world. Chicago bas 10,400 telephones, operated in 11 exchanges. The number of "talks" really represents the business of the exchange, and tbey number over 145,000 a day. To accommodate this vast business the company has put down 48 miles of underground conduit, containing 18,000 miles of wire.

Home-Made Electric Batteries.

A wrlter in the *Scientific American* describes a home-made storage battery as follows: I made two cells, each composed of eight 6 by 8 plates. I rolled my plates out of old tea lead melted into a bar. This lead is remarkably pnre and soft and easily worked. I rougbened the plates and coated them with red lead made into a paste with water, and when they were dry I wrapped them witb strips of muslin to hold red lead in place until it could be reduced in the "formation." I did not use sulphuric acid to mix red lead with, as it is not necessary and is bad for hands and clothes.

I used ordinary gravity glass jars for my cells, and connected the cells in series, using a 10 per cent solution of sulphuric acid (commercially) by measure. I charged the two cells at once by a current from six cells of gravity battery, arranged in serles. Charged for eight hours and then discharged storage cells through 10 ohms resistance. Then charged in opposite directions and discharged througb resistance again; then kept charging and discbarging in opposite directions for about ten days, when the cells were in good condition. I never have used more than six gravity cells to charge with, and now keep charging current on all the time.

I nse the cells to actuate my dental mouth lamp and plugger, and am making a motor to run my dental engine. The current from the two cells is strong enough to melt four incbes of No. 20 iron wire and heats a platinum cautery wire wbite bot.

The manufacture and charging of a storage battery presents no difficulties, and its efficiency and power are remarkable, making it "the battery" par excellence.

Cost of Power Transmission.

At a recent meeting of Section G, Britisb Association, Mr. Gisbert Kapp read a paper entitled "Relative Cost of Conductors wlth Different Systems of Electrical Power Transmission." The author said that with the alternate current there is no necessity of bigh insulation of generator or motor, but only of the transformers, whicb can be easlly insulated by tbe use of oil or other means. The autbor dealt with five systems of transmission: 1. Single-phase alternating ing current transmission by two wires. 2. Double-phase alternating current transmission by fonr wires. 3. The same by tbree wires. 4. Three-pbase alternating current transmission by three wires. 5. Continuons current with transmission by two wires. Thus if, for the transmission of a certain power over a given distance by continuous current, 100 tons of copper were required for the line, tben tbe single-phase alternating and the two-phase four-wire system would require 200 tons. The two-pbase three-wire system would require 290 tons, and the tbree-phase three-wire system only 150 tons; therefore, so far as the line might be concerned, there would be a distinct advantage in the employment of the three-phase system.

Electricity in Sanitation.

Electricity in addition to its other manifold uses is a sanitary agent, says *Electricity*. When Prof. Tyndall was experimenting with atmospheric dust in his researches on the origin of the lowest forms of life, he found that an electric discharge passed through a dusty atmosphere purified it by causing the minute particles to settle. And long before these researches it was commonly said and believed that a thunderstorm purified tbe air. Thus a scientific foundation is found for the popular belief, and the lightning flash takes its place as an accredited sanitary agent.

A Large English Scheme.

A plan for the distribution of electric power over a good portion of England is proposed by A. B. H. Thwate. His idea is to burn the fuel at the mines, where it costs but little, and then transmit the power resultlng from tbe combustion of the coal and gas by high-pressure alternating currents of electricity. He proposes to use gas engines of not more than 500-horse power to generate the electricity. From one station be would supply the centers of industry of Lancasbire and the area adjoining the sbip canal; from a second those of Yorkshire; from a third tbose of Midlands and London.

Useful Information.

Ozone.

Tbe name of ozone bas a very peculiar fascination for tbe public, says *Tradesman*. The fact is that ozone is considered as a mysterious agent, to which all sorts of marvelous properties have been attributed about which many "fairy tales" have been told in books and publications, some of which bear scientific repute. Another popular impression is that ozone is a new product that has only lately come withln the ken of scientific men. How far from the truth this belief is is sbown by the fact that in a lecture now being prepared on the subject of ozone by one of the leading electro-therapeutists of America, over 130 authorities are quoted, some of which date back hundreds of years.

Although the virtues of ozone have occasionally been exaggerated, there is no denying that it can render many valuable services, not only for therapeutic or sanitary purposes, but in chemistry and in several industries. The employment of ozone will quickly become more general when it will be possible to compress it and sell it in cylinders, as carbolic acid and oxygen are now sold.

The commercial uses of ozone are innumerable. It is useful in bleaching, as it destroys organic colors, especially in wool, cotton, vegetable fiber, paper pulp, oils and ivory. The improvement of wines and spirits by ozonization is now commercially applied. Light wines, however, cannot be ozonized, unless the operation is conducted with the greatest care, because a too strong treatment gives rise to the formation of aldebydes and vinegar. The expense of aging and refining alcoholic liquids in this way is trifling, as a very small quantity of ozone is required.

Among the physiological uses of ozone, the most important is the purification and disinfection of air and of tapestry hangings in sick rooms and in ships. In the British Museum and several public buildings in London, where large numbers of people congregate, and where the miserable arrangements for ventilation are a disgrace to a civilized commnnity, a successful attempt has recently been made to render the air less poisonous by the introduction of ozone. It is more than likely, too, that as soon as the difficulties whicb now attend the making and application of ozone are reduced, it will be freely used in churches and other places of worship, in which whole congregations now become inattentive and sleepy, often more from the impurity of the air than from the dullness of the sermon.

Ozone is also an insecticide and can be used for the destruction of caterpillars and beetles. The influence of ozone in this respect is seen on passing a supply of it through a flower-pot in the earth in which some worms have been placed. The worms almost immediately force their way to the surface. The experiment has induced some people to try to destroy the insects which cause so much damage to vines, and to have some iron pipes in the vineyards, tbrough which ozone is forced, so as to kill the phylloxera microbe. But this will only be practicable when ozone can be stored and compressed, as well as produced and sold cheaply.

As showing the effect of ozone on animals, it is related that a factory was infested with rats and mice, but as soon as it was utilized for manufacturing ozone the animals completely disappeared. The time will shortly come when the drinking water of all cities will be snbject to the action of ozone, by which many of the ordinary bacteria, snch as those of typhoid, cholera, etc., and their spores are killed. Sewage water or water contaminated by the refuse of works will also be treated by ozone, not only for the killing of bacteria and the decomposing of the ammonia into its constituents, but for the simultaneous oxidation of all the organic substances in suspension.

Among the legions of uses of ozone may also be mentioned the manufacture of ferments for breweries and distilleries and the preparation of yeast where the expulsion of bacteria leaves a pure ferment and prevents after-fermentation.

Some Uses of Hot Water.

Hot water is far more of a medical property tban many believe or know. Because it is to be had for the making thonsands think it valueless, on the theory that what comes easiest is oftentimes least thought of. The uses of hot water are, however, many.

For example, there is nothing that so promptly cuts short congestion of the lungs, sore throat or rheumatism, as hot water when applied promptly and thoroughly.

Headache almost always yields to the simultaneous application of hot water to the feet and back of the neck.

A towel folded several times and dipped in hot water, and quickly wrung out and applied over the toothache or neuralgia, will generally afford prompt relief.

A strip of flannel, or napkin, folded lengthwise and dipped in hot water and wrung out, and then applied around the neck of a child that has the croup, will sometimes bring relief in ten minutes.

Hot water taken freely half an hour before bedtime is helpful in the case of constipation, while it has a most soothing effect upon the stomacb and bowels.

A goblet of hot water taken just after rising, before breakfast, has cured thousands of indigestion, and no simple remedy is more widely recommended by pbysicians to dyspeptics.

How Mail Clerks Assist the Memory.

The railway mail clerks have a unique metbod, says a contemporary, for learning the rontes on which post offices are located. Take, for example, the State of Pennsylvania, in which there are over 5000 offices. The prospective mail distributor buys a quantity of blank cards—about the size of the ordinary visiting card—and on each of these he writes the name of an office. On the back of the card he writes the name of the route by which the office is served with its mail. Taking in hand a package of these cards—say from 50 to 100—he goes over them one after another studiously, looking at tbe back each time and getting the name and route clearly associated in his mind. The second time that he goes through the route he finds that he knows the half of the route by reading the name of the office. It is a dull student who upon going tbrough a pack of cards a dozen times does not know them thoroughly. The method is so simple and such an aid to memorizing that it is adopted by all railway mail clerks. By it clerks have been known to memorize a State like Pennsylvania inside of two months.

On all large routes clerks work but half time, the other half being devoted to rest

and sindy. The mail clerk at home, continually reminded of coming examinations, carries his cards wherever he goes, conning them over at every opportunity. One demonstrative clerk on the New York and Pittsburg R. P. O. is famed for having learned the State of Ohio in four days. As he shuffled over his cards he walked from garret to cellar, and *vice versa*, from dawn notil the shades of twilight fell. On the fourth day he weot to the examioer's office and separated Ohio without an error.

It is related that the wife of a postal clerk adopted the card method for increasing her vocabnlary in French. Oo one side of the card she wrote the French word and on the other the Englisb equivalent to be learned. Another lady, hearing of this, used the same system successfuliy for learning mythology, placing the word "Mars," for instance, on one side of the card aod "war" on the other. The method has so many advantages over the old and tedious way of learning from the pages of a book that it might be utilized with advantage hy teachers in search of new methods of lmparting instruction.

Magnitude of Railway Business.

E. A. Mosely, In an address before the Railroad Trainmen's Convention at Boston, gave some statistics regarding the magnitude of railroad interests in this country. Some of his statements were as follows:

"To transact the business of the railways, there were required last year the services of 33,136 locomotives, of which 8848 were employed in passenger service, 17,559 in freight service, and 6729 in yard servlce and in service not specified. To perform the passenger traffic of this great country last year 28,876 cars were employed, and the freight service of the country gave employment to 966,988; 36,901 cars were required in the service of the railways themselves.

"Putting these figures in a more concrete and definite form, the locomotives of the railways of the Unlted States, if marshaled, with their tenders, into a single line, would make a train 357 miles long. With the passenger cars reported owned last year, we might make a train that would reach from Boston to within fifteen miles of Philadelphia.

"But the most wonderful figures are brought out hy a similar arrangement of cars in freight service. Placing these cars together in a continuous train, it seems almost incredihle that this train would be 7028 miles long, hut so the figures make it appear, and, allowing the distance from Boston to San Francisco to he 3000 miles, our train of freight cars would reach from Boston to San Francisco, from San Francisco hack to Boston, and from Boston again as far west as Chicago. What tonnage they would move at a single load I leave you to conceive if you can."

How to Keep Cider Sweet.

Pure, sweet cider that is arrested in the process of fermentation before it becomes acetic acld, or even alcohol, and with carhonic acid gas worked out, is one of the most delightful heverages, says the *Sctentific American*. The following scientific method of treating cider will preserve its sweetness: When the saccharine matters by fermentation are being converted ioto alcohol, if a bent tuhe be inserted air tight into the hung, with the other end in a pail of water, to allow the carhonic acid gas evolved to pass off withont admitting any air into the barrel, a beverage will he ohtained that is fit nectar for the gods. A handy way is to fill your cask nearly up to the wooden faucet, when the cask ls rolled so the hung is down. Get a common ruhher tuhe and sllp it over the end of the plug in the faucet, with the other end in the pail. Then turn the plug so the cider can have communication with the pail. After the water ceases to huhhle, bottle or stnre away.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the Americao Continent. He writes whereof he knowe from personal practice, and in such plain and comprehensive terms that neither the scieotis nor the practical miner can mistake bis meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that bave been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of tbe Ore; Weigbing tbe Charge; Mixing and Charging; Assay Litharge; Systems of tbe Crucible Assay; Preliminary Assay; Dressing the Crucible Assaye; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Gobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of tbe processes for Zinc.

The book containe 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

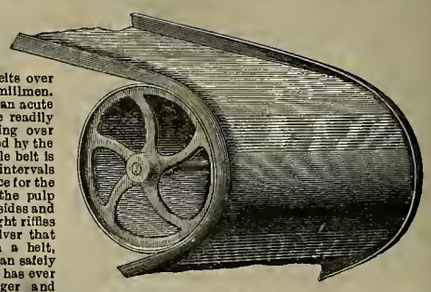
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

An Address to the Miners of California.

SAN FRANCISCO, November 21, 1893.

The Midwinter Fair has passed the primary stages of newspaper discnssion, and is now an assnred fact. It is more than that: it ls an assured success. Exhibitors from all parts of the world are applying for space; and, in point of diversity of interest, the Midwinter Fair will be fully up to the hlgh standard of the Columbian Exposition at Chicago. Never since the discovery of gold has California had such a magnificent opportunity to advertise her wonderful and varied resources. Though at first somewhat doubtfnl as to the snccess of the enterprise, the people have suddenly become thoroughly alive to the enormous advantages within their grasp; and, from one end of the State to the other, actlve preparations are in progress for an exteosive display of California's industrles. The farmers and fruit-growers have already arranged for an extensive exhibit of their industries, wherein a spirited rlvalry between the northern and southern portions of the State will add interest and enthusiasm to this feature of the exposition.

The miners must not permit the exhibitlon of their industry to he second to that of the farmer and fruit-grower, nor permit the lmpression to go abroad that the industry that made Californla has given way to the grain field and the orchard. There ls but one thing for the miners to do, and that is to at once, and wlthout delay, prepare an exhibit that will convince the world that California is still a mining State. The miners of Callfornia cannot afford to make a mlstake ln this matter. Not only shonld it be a matter of pride with the mlners to see the Callfornia Mineral Exhibit occupy a leading place at the Midwinter Fair, but it is really a matter of necessity as well. From Montana, from Idaho, from Colorado, from Canada, from New South Wales, and from other parts of the world, will come mineral exhibits that have been notable features of the Chlcago Exposition, and California cannot afford to take second place among the mlneral exhibits. Not only must the world be given to understand that California is still a mining State, but that nowhere can capital find a more profitable field for investment than in the mining regions of California. The opportunity has arrlved, and it will he our eternal loss, as well as our mortification, if we do not promptly seize it and turn it to our great and lasting advantage.

The management of the Midwinter Fair has generously placed at our disposal ten thousand square feet of space in the Mechanic Arts buildlng, and committees, both general and local, have been appolnted to collect and arrange the exhibit. The utmost enthusiasm prevails among the members of the various committees, and there is no lack of active minds and willing hands to carry the enterprise to a snccessful conclusion: but, in addition to all this, there must be raised snfficient funds to properly install and maintain such an exhibit as will do justice to the mining industry of this State. It is estimated that it will require about twenty-five thonsand dollars to install and maintaln such an exhibit. The cost of arranging and putting in place such an exhlbit will be considerable, besides whlch there will be the cost of maintainlng the same for six months. The Executive Commlttee of the mining exhibit have estimated the cost very carefully, and do not see how a proper exhibit of the mineral wealth of California can be arranged and maintained for much less than the above sum.

This sum must all be ralsed by voluntary subscription, for the Midwinter Fair management is unable to render any financial assistance to the miners, though it has donated the space for the exhibit free of cost. It is believed that a proper mineral exhiblt will turn the attention of capitalists in the direction of our mines, and will mark a new era of prosperity for our partially neglected lndustry. To this end should our energies be directed; and every mlner, and every person interested ln the mines, and every person deriving profit from them, should, within the limits of his ability, do what he can to aid the cause we have so much at heart. "Many hands make llght work," and so will the burden fall llghtly on each lndividual if the cootributions he generally distrlbuted among those who are interested in the mining cause.

We have but a few weeks left in which to prepare and arrange our exhlbit, and any delay at this time would be fatal to the success of the enterprise. There is no danger of that, however, for the work is golng rapidly forward, and the miners are responding promptly and enthusiastlcally to the call for aid.

The times are propitious; the products of our mines are needed for the purposes of commerce, and now an exceptional occasion has arisen for the display and advertisement of our industry. Let us seize the full advantage of this splendid opportunity; and, when the Mldwinter Fair shall close its gates next June, let the verdict go forth to every part of the earth that Californla leads the world in mineral wealth, and that beneath her giant hills lie hidden stores of priceless treasure to reward the enterprise of man.

The Executive Committee of the Californla Mining Exhiblt of the Midwinter Fair.

By J. J. CRAWFORD, Chairman.

Coast Industrial Notes.

—Work on the Glla dam in Arizona is to begin in January.

—Oregon is shipping apples to Denver, Colo., in large quantities.

—It is reported that 300 men are at work on the Fort Bragg railway.

—The Fresno high school bonds have been sold to Denver capltalists.

—The lumher mills at Glenbrook, Lake Tahoe, have closed down for the season.

—An electric road between Chino and Pomona, in southern California, is proposed.

—The Treasurer of San Diego has placed the city's money, amounting to $30,000, in a safe-deposit box.

—Plans are reported to be nearly completed for the extension of the Pasadena electric road to the coast.

—The Pendleton (Or.) Savings Bank, which suspended in July, resnmed recently with increased resources.

—The Belmont farm, near Esquimalt, has been purchased hy the British Government, it being required for the new fortifications.

—Southern Oregon ranchers have been going to Yreka in large numbers lately to secure winter supplles of fruit, flour, dry goods and groceries.

—W. H. Mills, general land agent of the Central Pacific Railroad, has been elected a director in the same company, to fill the vacancy caused by the death of H. A. Cummings.

—The Davie Ferry Company, whlch has been for several months running active opposition to the Southern Pacific ferry system, is ln financial trouble, and has ceased operations.

—Richard H. McDonald Jr. and his brother have finally retlred from the management of the Pacific Bank, San Francisco, and the Bank Commissioners are in full and undisputed control.

—The largest galvanized iron tank ever made in Riverside has just been completed by J. Shiels & Sons. It holds 9000 gallons, and is for J. R. Newberry & Co., in whlch to store gasoline.

—Fifty thousand tons of heets have been delivered at the Watsonville Sugar Works, and 25,000 tons more will be delivered before the season closes. Every ton thus dellvered means $5, or a total of $375,000.

—A corps of engineers have been at Winslow, A. T., looklng over the country with a view of putting in a canal. They visited Hay lake, near that place, where it ls said a reservoir can be constructed sufficient to hold water enongh to irrigate 200,000 acres.

—The Stockton Combined Harvester Works, which have been shut down ever since the commencement of the financial crisis, will resume operations on January 1st next. Nearly all the old employes have remained in Stockton, and from 40 to 50 of them will be given employment. The firm has nearly $40,000 worth of work to be completed and will not again shut down till the usual dull season arrives.

—Edward J. Read, B. L. McKays and G. A. Anderson of Deming, N. M., have filed articles of incorporation for the Rio Grande Valley Irrigatlon Company, wlth a capital stock of $1,000,000. The charter calls for a canal line beginning on the Rio Grande at White Rock canyon, west of Santa Fé, and skirting the foothills of the valley on the east slde of the river and running south 150 mlles. Thls is the second charter that has been taken out coverlng practlcally the same territory, and a lively conflict over the right of way is expected to arise.

—The principal local savings banks have so much coin in their vaults that they are waiving the full term of six months' notices usually demanded of term depositors before money can be withdrawn. Many depositors who gave notice of their intention to regain possession of their funds during June and July will now have an opportunity of doing so, but it is doubtful whether many will avail themselves of the privilege. Notices that money may be withdrawn in advance of the usual time have been sent ont by the Mutual Savings Bank and the German Savings and Loan Society.

—Late Saturday afternoon (Nov. 11) the waters of Yuba were let into the cut-off, says the Sutter *Independent*, and soon flowed through lts entire length to the full width of the deep channel in the center. By Sunday afternoon the volume of water flowing ln had considerably increased, as the sand and slickens at the inlet washed out and wldened the entrance. It was estlmated that half the water of the Yuba was flowing through the new channel and a marked difference could be seen at the old mouth. The contract ls practically completed, and the contractors have done a good job.

—Pres. Blakely of the Nevada Sonthern, C. Mulholland and others engaged in the work of raising an $80,000 loan in southern California, are well satisfied with the progress made, says the Los Angeles *Express*. The enthusiastic and business-like meetlng at Pasadena gave the enterprise a new impetus. Citizens of San Bernardino have also asked that a meeting be held there to present the matter to the people. It ls understood that, so far, Los Angeles business firms and private indivlduals have pledged about $40,000, and additional assurances are given by whlch the amount will be increased a little later. The prospect of raising the entire amount needed for immediate heavy work on the roadbed seems very good.

—A special committee, appolnted by the Oakland Clty Council to investigate the water questlon, has received bids from parties who are willing to contract to furnish water to the city. The proposals were made on the basis of the rate per 1000 gallons for different quantitles, ranging from 2,500,000 gallons per day to 10,000,000, the water to be delivered at the eastern end of the city, under a pressure of 50 pounds per square inch. The blds were as follows:

	First bid, Cents.	Second, Cents.	Third, Cents.
2,500,000 gallons.....	4½	8	10
3,500,000 "	4¼	7¾	9
5,000,000 "	3¾	7½	8
6,000,000 "	3½	7	7
8,000,000 "	3¼	6	7
10,000,000 "	3	5½	7

—A rumor comes via Victoria that a new line of steamers will be run from the ports ln British Columbia and on the Sound to San Francisco during the continuance of the Midwinter Fair. The vessels to be displaced by the construction of new ones for the Gulon Line, now operatlng between New York and London, are mentioned as those whlch will be utilized for the projected service. A recent visit to the Sound cities by officers of the Guion Line, the Dominion Steamship Line and the Canadian Pacific Railway gave rise to the rumor. The steamers spoken of are the Alaska, Arizona and one other. All three are over 4000 tons net and average sixteen knots, reducing the time between Victoria and San Francisco to less than two days.

—The contract for constructing the first section of the Government jetty and revetments and the approach thereto at the mouth of the San Dlego harbor, which was let to S. R. Smith of Portland, Or., has evidently proved too much for that gentleman to handle alone. In the first place his bid was so low as to admit of only a nominal profit even if the job was handled to the best possible advantage. The contractor dld not control enough money to complete his contract. This condltlon of affairs caused considerable dissatisfaction, whlch culminated at the quarries last week when the stonemen refused to work longer without pay. The work at the jetty was closed down soon afterward. Contractor Smith is said to have succeeded in arranging to have the Cuyamaca Railroad Company assume his obligations and continue the work on the jetty.

Here is where the mind must dwell and rest. Not on our trials, weaknesses, follies, failures, sins; we can do better. The good things are most real, the best things are most true, the greatest things are most sure. What the light shows—the vision of spiritual reality—to that let us forever make fast.—Rev. Charles G. Ames.

Never esteem anything as of advantage to thee that shall make thee break thy word or lose thy self-respect. Remember this: That there is a proper dignity and proportion to be observed in the performance of every act of life.—Marcus Aurelius.

He who receives a good turn should never forget it; he who does one should never remember it.—Charren.

Our grand business ls not to see what lies dimly at a distance, but to do what lies clearly at hand.—Carlyle.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AT THE MAYFLOWER.—*Ledger*, Nov. 16: Stephen H. Emmens, maneger of the Mayflower mine, formerly the Bunker Hill, was in Jackson on Fridey last accompanied by his son and Supt. Crocker of the property. The new company which recently took hold of these properties propose to thoronghly prospect and develop their gronnd in an economical and business-like manner. Mr. Emmens, who is a consnlting engineer and chemist, has had a great deal of experience in mining in other States and conntries, and hopes to find a good-paying mine at the Mayflower.

At the Albany the carpenters are at work erecting a building over the Middle Bar shaft.

At the Wildman sinking is in progress. The shaft is now below the 1100-foot level, and it is the design of the snperinteudeut to go down 200 feet farther.

The main building of the Alma has been raised during the week, and the gallows frame is in position. The machinery which was purchased some time ago is expected daily.

W. H. Stowers, a mining engineer, representing the State Mining Bnreau, is making a critical examination of the mines along the mother lode. He is at present in Jackson, accompanied by his wife and child.

John Myers resigned his position at the Mayflower near Amedor and has taken a position neer Oroville. N. W. Crocker, formerly superintendent of the Bunker Hill, hes assnmed the snperintendency of the Mayflower properties.

At the 800-foot level the Hardenbnrg people drifted north 200 feet and south about 175 feet, and then crossent to the ore body bnt a few feet away, finding a ledge of quartz from four to five feet in thickness. They were delighted with their prospect, and rumors are now afloat that in a short time the Hardenburg mill will be ponnding away on profitable rock.

Head mechanic V. S. Garbarini at the Kennedy has been very busy of late making new improvemeuts. He has about completed a large and commodious blacksmith-shop and is now at work erecting a new gallows frame at the south shaft. The work is being done in the most snbstantial manner, and, when completed, will be the best and most durable mining improvements so far made in the county.

AT THE BAY STATE.—Cor. *Record*: Superintendent Jones of the Bay State informs me that the concrete bulkhead in the mine will be completed to-day, November 16th. They have two pipes through the dam, one eight and the other four inches. With valves the pump can be put to work at any time desired, and also the water tubs if necessary, to rednce water in the mine without interfering with the sinking. The hills in the vicinity are full of prospectors, and a good many, notwithstanding the law that releases them from assessment work for the present year, are doing their assessment as usual.

Butte.

A NEW VENTURE.—Biggs *Argus*, Nov. 16: S. J. Bruton, W. Ralph, James Gallagher, John Woods and several others are making arrangements to prospect in the monntains near Bangor for gold. Outside of shovel, pick and pan, they estimate the actnal expense of each man at only $9 for a month.

EXTENSIVE DEVELOPMENTS.—Oroville *Register*, Nov. 16: Within the past few years the developments in this county have been marked and extensive. At Forbestown there are now three quartz mills with eight stamps, and a fourth mill is being built which will give ten more stamps.

At Oregon City, within the past year, two mills have been built and one is now in operation and the other will be in a short time.

At Hurleton a new mill has been built within a year, and two other mines have been developed so extensively that mills will be erected.

There has been a new mill built by D. K. Perkins at the summit of the mountains near Gravel Range, while the mining developments about Bangor have been great, and 100 men are now employed where two years ago not ten found work.

A new mill was erected this season at Nimshew. It is thought that the qnartz mill on the Banner mine will soon be started.

There have been more ledges opened and more mines developed in Butte within the past two years than during the six years that preceded 1892. This progress is by many thonght only a beginning, and the sangnine ones predict that Bntte will yet become the banner mining county of California.

The shaft in the Stow mine at Dutch Ravine is now down 165 feet, and from the bottom of it two levels, each 500 feet long, will now be run. At the Phœnix mine 12 men are working, and some very fine rock has lately been taken out. No work is being done at present in the Pactolian.

BANNER MINE SOLD.—Oroville *Register*: Maj. McLanghlin has bonght from W. E. Phillips and the Hazard Mining Company the property locally known as the Banner quartz mill and mine. This property the major has sold to the Development Syndicate, limited, of London. The mines inclnde the Banner, Banner Extension, Amosky and the Clark & Coffee ledges. In an early day the top gronnd of the Banner ledge was worked and proved very rich. The shaft is now down 500 feet, and it is reported that fine rock has been struck in the lower levels.

Calaveras.

BEAT ALL RECORDS.—Stockton *Independent*: The October yield of the famous Utica mine at Angels beat all records, as James Cross puts it,

giving the owners a clear profit of $142,000. The clsan-up amounted to $182,000. Of this snm, Messenger McConnell brought down $71,000 on the 19th of October, and the balance of $111,000 was brought through recently. The cost of operating the mine and the big 100-stamp mill is $40,000 a month, leaving the deserving owners a profit of $47,334 each for the past month. The mine is ownsd by Alvinza Hayward, the Hobart estate and C. D. Lane, the general manager. Jas. Cross, sxecntor of the Hobart estate, was in town recently on his return from the mine. He was as well pleased with the great clean-up as he would have been if he was one of the lncky owners. Col. Hayward and Mr. Lane were also pressnt when the clean-np was made, the latter having recently retnrned from a visit to the East. These three gentlemen meet at the mine regularly each month.

El Dorado.

BEING REOPENED.—*Republican:* The Melton mine at Grizzly Flat is being reopsned by an Eastern company. The men employed so far have bsen cleaning ont the ditch and doing other work preparatory to getting into the mine.

Kern.

PLACER MINING CLAIMS.—*Echo:* The following mining locations have bsen made: J. W. Ahern, J. S. Douglas, D. V. Bnrton and L. A. Burton, 20-acre mining claim in the Valley View mining district; W. J. Snllivan, 20-acre placer claim, two miles northeast of the old stage station in Red Rock canyon; W. Black, 20-acre placer claim in the same locality. These two last filings cover gronnd in the new mining camp 30 miles north of Mojave, which has caused so mnch excitement.

Lassen.

STRUCK IT AT LAST.—*Advocate:* During the past few daye there has been exhibited in Susanville a fine lot of gold specimene amounting to about $40, the resnlt of 20 pans of gravel from a claim at old Cariboo, on the north fork of the Feather river. The claim is owned by W. B. Long, J. C. Long and Arch Harper, and has been prospected and worked by the first named for the past five or six years. The gold is smooth washed—the regular channel prodnct—and will go $18 an onnce at least. The owners are confident that they have unearthed a bonanza, and from the above showing it certainly looks as thongh they had.

Madera.

BRIGHTENING UP.—Mariposa *Gazette:* Mining aronnd Grnh gulch, Madera conty, has brightened up again and a steady boom of prosperity overhangs the camp. A new 10-stamp mill has been erected and an electric plant in the Fresno river will furnish all needed power.

Mariposa.

ACTIVITY IN MINES.—*Gazette:* Matters begin to assume a business-like air aronnd Mariposa. Minere and prospectors seem to spring np everywhere. A camp of abont 20 men is located at what is called the McCann epring or May Gronnd, a mile or so above town. Strange men are fonnd in every gulch. If any gold can be found in Mariposa, this winter will surely prove the fact. Most of the prospectors appear to be quiet, industrious men, who work steadily, with a view to finding ont what is concealed in onr hille and gulches. Some of the developed mines of the neighborhood are also being worked on a small scale and from one or two, very satisfactory results have been obtained. The Helm Bros. of Whitlocks made a clean-np last week of 50 tons of rock, from which they realized 27 ounces. The gold of that locality generally brings $17 and $17.50 to the onnce. This made a very snug snm.

NEW MILL.—*Gazette:* A five-stamp mill is to be erected very soon on Missouri gulch, just above town. The lumber and machinery are to be on the ground next week.

Nevada.

THE NORAMBAOUA.—*Telegraph:* Those who are now working the Noramhagua mine are contending with very hard ground. The tunnel is being driven ahead ae fast as possible with the object of cutting the ledge. Mr. Wm. Campbell, who is the principal owner in the mine, informs us that the tunnel will only have to he run abont 50 feet before the ledge is encountered. It is expected that the ledge will be tapped along abont the first part of January.

COMING TO THE FRONT.—*Transcript,* Nov. 17: Under date of the 13th instant M. Kinzle writes as followe from the Centennial, which is located in Washington township, this county: "Ae you might expect, from my last letter, the ground in the top of the second crosscnt we are running is mnch softer and the gravel hed is making down into it, with bedrook and all prospects onr way, in addition to what we have already developed elsewhere in the mine. The Centennial is bound to step forward in the front rank among the gravel gold mines as soon as we get to waehing. As to the San Jose mine, which adjoins ns on the eonth, our respective workings are some 2000 feet apart, the Oentennial heing about 40 feet the lowest, or will be when we connect. They are doing mighty well, and taking ont gold that I have seen, piecee of which weigh from five to eight dollars. Onr course gold lies in that direction and we must have it as well as they."

TO START UP.—*Transcript,* Mov. 17: The new hoisting machinery at the Champion mine will he started Saturday. All the directors of the company will arrive here thie evening, so as to be present when the big machinery is set in motion.

FIRST BLAST IN TWELVE YEARS.—*Union,* Nov. 16: The old Exceleior hydranlic mine at Smartsville, which was closed down by the valley wreckers twelve years ago, is now in full opsration again and the work is progressing favorably. The workmen met with great success the other day when they fired off a huge hlast. It was the first large one that had awakened the hills in that vicinity for mauy years.

THE ALLISON RANCH.—*Union,* Nov. 16: Abont a dozen men are at work repairing the ditch which will convey water to the famous Allison Ranch mine. In the spring employment will be given to a very large number of men withont a donht. The company which has hesn formed to work the mine will spend in the neighhorhood of $200,000 if necessary to develop the property.

Placer.

NEW MILL.—*Herald:* A new stamp mill is heing hanled from Anburn station to Gresn Valley, on the American river opposits Alta. It is to be erected on a cement gravel mine which has been opsned np hy an Oakland company, and in which, according to the reports that have come to ns, prospects are very fine. Mr. Ames is the superintendent.

THE ALTA MINES. — Placer *Herald:* The Bonanza mine at Alta, Andy Rodgers, supsrintendent, has its tnnnel in about 600 feet. At this distance they mads an npraise of 120 feet and struck gravel which is believed to be in ths rim of the channel. Though they are across the river from the Monntain Gate mine at Damascus, they are prospecting for the same channel. If it proves as rich on the north side of the river as it has been on the sonth eide, and there is no reason why it shonld not, the Bonanza, which has heretofore attracted bnt little attention, may be heard from hefore a great while as another dividend-payer for Placer conty. Mr. Rodgers has great confidence in the ontcome, and in the mineral wealth of the district, as is evidenced from the fact that very recently he purchased the Golden Eagle mine, consieting of 360 acres, in the eame locality, from Mr. H. D. Dresler. The prospect of these properties opening np well, in connection with the favorahle development in Green valley, gives strong hope of a revival of business in that portion of the conuty.

Riverside.

IN GOOD OEE.—*Press:* Ex-Governor H. G. Blaisdel of Nevada is spending considerable time, energy and money in developing a mining claim hetween Perris and Elsinore. He saye the ore thev are now taking ont of the mine mille about $12 per ton, and the prospects are good for a better grade. It is the intention to thoroughly test this mine, and, if the grade of ore continues to improve, a large stamp-mill will be put in.

Sacramento.

VALUABLE DIOOINOS.—According to the Folsom *Telegraph,* a gentleman from Colorado has been quietly moving through the mining camps abont there the past week, and he nnhesitatingly prononncee the locality as yet the best gold camp he knows of. He says a rewaeh of the old workings by appliances now obtainable wonld prodnce mnch more gold than they are getting from the much-vaunted gold fields of Cripple Creek, Colo. The Chinese, he says, are the only placer miners in this section, so far as he can discover, who make any effort to save anything hnt coarse gold. The gentleman says it is hie intention to interest some parties who are fnlly prepared to do the camp justice.

Shasta.

GOON OEE, BUT HARN TO MILL.—*Democrat:* Warren Dunham of Igo, who has several good mining properties both at Muletown and at Sonth Fork, has ore that is very rich, hut like many other mine-owners finde it difficult to work it and save the gold. It is the same old tronble—no process at home, and only the richest ore will pay to ship. But in time the difficulty will be overcome and then Shasta county will boom in earnest.

Sierra.

PREPARING TO HYDRAULIO.—*Mountain Messenger:* A. D. Gassaway has returned from French Corral and Sweetland, Nevada county, where he has been working on the eurveye and estimates of some imponnding dams for the Kate Hays, or Milton Mining Co.

The B. M. Ex. Co. is going along qnietly, also the Rnby mine, working the nsual number of men.

A crosscnt is being made from the bottom of the shaft to the ledge in the Golden King mine. This distance, we learn, will not be over sixteen or twenty feet. This shaft is expected to develop the mine, as it will he at a depth of from 160 to 180 feet perpendicular.

The Mt. Moriah mine has a list of about 150 men, who are all hard at work with a hope that everything may be in working order at the mine and mill hefore snow flies. The tramway will he of elevated buckets, so the snow will have to fall pretty deep to interfere in conducting the ore to the mill.

The contractors are sinking on the Idaho quartz mine with favorable prospects. Ten men are at work at that mine. It ie reported that there will be hoisting works pnt np thie fall. The partiee from below who are managing this property were np thie week and report everything satisfactory.

G. K. Orr, of Slate Creek, reports the shaft nnder good headway, and that the finme, 3½ miles long, of the Slate Creek Mining Company's claim, the largest ever in Plumas or Sierra counties, will he completed in two weeke nnder the ahle enpervision of Snpt. J. W. Moyle. Mr. Orr came here to lay in winter snppliee for the New Orleans drift mine on Little Grizzly, near Poker Flat, where he is a etockholder and snperintendent. A good prospect has been obtained.

THE EMPIRE.—*Mountain Messenger:* At the Empire mine in Gold Valley, a very handsome showing has been made lately. The shaft is down 220 feet below the croppings. The ledge is six fest wide to the depth of 200 feet, bnt within the last 20 feet it has gradnally widened nntil it is 10 feet wide at ths hottom of the shaft. The six feet of the ledge lying nearest the footwall runs fully 40 psr cent sulphnrets. The fonr feet next to the hanging-wall is mostly white rock with sprinkling of sulphnrets. On acconnt of the nearness of the winter no further work will be done. When spring opens hoisting works will he erected, ths mill remodeled, and the plant put into active operation.

San Diego.

ONE MAN'S WORK.—Nnevo *Sentinel:* Charles Cox has hesn working on the Tom Scott mine since the latter part of June. He has, single-handed and alone, rnn 250 fest of tnnnel and tapped the Good Hope ledge, opening np a hody of very fine ore. He will also rnn a crosscut to the Tom Scott ledge. The mine was worked with good results in the early days of the camp, bnt with the litigation over the boundaries of the Cuyamaca grant was abandoned. The indications now point to the development of a very fins mining property.

MAY PUT IN A MILL.—*Vidette:* H. Smith and G. Williams have leased the New Discovery mine, situated on the Scholdsr ranch at Mesa Grande. They have sunk a shaft to a depth of 35 feet and have taken ont ahout five tons of ore which will mill at $20 or more psr ton. As soon as the mine is in shape to work they will put np a small quartz mill.

Trinity.

TO BUY MINES.—*Journal,* Nov. 18: William Berry, accompanied hy Frank Adams, a mining man of Placer county, arrived last Sunday. Thursday morning they left for Canyon Creek. Mr. Adams, in conjunction with J. L. Thacker of San Francisco and E. S. Evans of St. Paul, have made arrangements to pnrchase the Silver Gray mine. They will prospect the mine thoroughly, and if satisfied with the outlook will bny it at an agreed price.

A GOON CAMP.—New River Cor. Trinity *Journal:* Abont the usnal amonnt of mines are in operation in here, with very good results. A. G. Fulmore sold a prospect a few weeks ago that he located last January to Mr. Geo. Fernie, of Phillipsburg, Montana. The mine is known as the Lost Hope, and shows np favorably, thus far, for the amount of development done. The purchase price is ahont $2000. Since Mr. Fernie has taken possession of the mine he has taken ont about 75 tone of ore, which he is having crushed at the Excelsior mill.

Messrs. Campton and Phillips of Rhonerville, Humholdt conty, have been np here doing assessment work on their mine, which is sitnated on the Pony Creek divide, abont two miles from here. Mr. Campton showed us a small quantity of amalgam, which he said he realized from one ponnd of qnartz. It weighed exactly 25 cents, or $500 per ton. It may be safe to state that this must have come from a rich pocket in the ledge. No donbt, however, after further development work, this mine will turn out well, ae the ledge stands almost upright east and west, pitching a little to the north in a solid formation.

P. H. Loring of Callahan's ie working the Grover Cleveland. He has James Mullane's pack-train engaged in packing ore to the Uncle Sam mill.

The Sherwood mine, which is and has been the best-paying mine in camp, is producing abont two tons of ore per day. There are several men engaged there nnder the sunervision of two of onr best practical miners, Leas and Nicholson.

The old firm of Miller & Stone is again re-established. They have just taken a lease on the Brizard mine for a certain number of years. Ae this mine is an extension of the "Sherwood," there is no reason to think that it will not be just as good a mine as the former after it ie opened np.

Mr. Badger and Mr. Winkler, two silver men from Colorado, arrived here a few days ago from North Fork. They are looking around the mines, and have not decided as yet whether they will remain here all winter or not.

Tuolumne.

THE APP.—*Independent,* Nov. 18: The shaft is now snnk 20 feet helow the 800-foot level for sump pnrposes. The company will now commence drifting and opening np the 800 level by drifts north and eonth. The mill is uot running, owing to the huilding of new flumes to connect with mill, and when the work is completed crushing will be resnmed to clean np the ore dumps; then the rich rock now stowed away in the levels in the mine will be raised and milled. The accumnlations are several hnndred tons.

DUTCH MINE.—At this mine there is not much to report eince onr last, except that from No. 2 shaft a crosscnt has been entered into the hanging wall, which ie of green rock formation, and a fine hody of ore has been developed, which shows gold freely, so far, ten feet in width.

THE STENT MINE.—Since our last visit to this property, a west crosscut drift has been entered ahont 40 or 50 feet in length and a solid vein of three to four feet was intersected which shows free gold. A new hoisting worke building has been erected 28x42 feet. Mr. Stent, the superintendent, ie in San Francisco ohtaining new machinery for hoist, and is expected back to the mine on Thnrsday, the 16th. This fine property gives great promise as the developments proceed. It ie located on the sonth slope of Quartz Mountain, formerly the Miller & Holmes.

THE NEW ERA.—The owners of this mine are eteadily sinking their ehaft. The rock is hard, with a diahase foot-wall. Good prospects, with gold showing in the qnartz. With a eteady syetem of development, this mine will make a good ehowing, hut capital ie needed to enlarge the works, and power to run Burleigh drills, which would sxpedite the sinking greatly. This claim is only in its infancy. Drifting will he in order when the shaft is sufficiently desp.

THE CRYSTALLINE MINE.— This property is heing vigorously developed. The immediate work is drifting from north shaft sonth to No. 2 shaft. They will soon connect, having only a few feet before connection will he made; distance hstween the two shafts, 65 feet. The mine will then be well vsntilated. Ths above explorations are on what is known as the east vein, a fine body of quartz showing rich gold. The works are situated near to the north honndary and adjoining ths Alabama mine. The bowlder vsin is sitnated directly to ths west. The croppings ars massive and should he crosscnt from No. 1 shaft from esst vein, which would intersect the howlder lode, and where, no donbt, a parallel shoot will he found, as the immense croppings give good prospects. About 300 feet south a shaft is snnk 60 fest on the bowlder vein. The rock milled 16 per tou, in talc formation. Again, near the south houndary, work has heen developed on the east vein by a tunnel 225 fest in length; by continning this work 80 feet the howlder lods would he reached. This would give 200 feet of backs. Rock value at presnnt, tunnel level, $4 to $5. Again, hy further drifting on ssms level, 40 feet ahead, the west veiu would be intersected, makiug a total of prospective develoupmsnt 120 feet. Thie would open up the soutb end of the mine hy a good eystem of crosscutting. The west vein carries good pay rock. Nine stamps are running during the day on rich rock from the north drift. Owing to a scarcity of water at this season of the year the mill cannot run continuously, bnt hy an outlay of capital water can be had on this mine all the year round.

THE PACIFIC.—This miue is located on the mother lode and joins the Sweney on the north. Negotiations have been pending for some weeks for the sale of this mine and all papers were signed on Wednesday last for the sale. O. S. Oressey of Providence, R. I., is now in possession of the property.

TARANTULA.—Thie mine is located north of the Alameda and south of the O. K., on the same vein, the mother lode of California. Within the area of the mine the howlder and east veins are fonnd. There is a shaft nearly 100 feet deep which exposes a large body of pay ore some 10 or 12 feet in width. Further, there is a smaller vein that has paid 50 per ton. It is fine property, and only requires developing to make it a payable speculation to any one seeking investment.

NEVADA.

Washoe District.

THE RULE PROJECT.—Virginia City *Chronicle,* Nov. 16: The Con. Virginia shaft is now in good repair to the 1000 level and the work of cutting ont the shaft station is in progress. The repairs to the ehaft were completed on Tuesday and the latter work then hegun. The air pipes to the 1000 level are all in aud are in working order, and the hlower at the month of the air shaft was started yesterday. Everything about the works ie going smoothly, and the merry whir of the engines, and the materials and muddy care scattered about give the place a bueiness air.

The point where the excavation is heing made for the station is in good ground and the work is going ahead at a speed commensurate with the favorable conditions. The station chamber will take several daye for its construction. It will be abont 11 feet wide in the clear, and 9 feet high and hetween 20 and 30 feet in length back from the shaft. As soon as the station has been completed, drift toward the point where the ore body is said to lie will he begun.

The drift will he in virgin ground all the way to the objective point and also in the ledge or close to it. The location of the ore hody is three or four hnndred feet in a soutbeasterly direction from the station, and it is possible that ore will be found at any or several pointe along the entire ronte. The ground is good prospecting gronnd all the way, and it will he nothing strange if a deposit of ore is found in it.

Ae is well known, the Comstock ledge, running north and south, trends a little north by east and south hy west. The Rule drift will cut across the ledge in the direction of south hy eaet, and the relative positions of the drift and the ledge will be like those of the hlades of a slightly open pair of shears. It will thus he seen that, generally speaking, the drift and the ledge will he together all of the time. The Rule ore lies close to the east or hangiug wall, and that part of the ledge hss always heen most favored with discoveries. The prcject seems to possess some very encouraging possihilities, and if it provee successful, as is most eincerely hoped it will, it will pave the way to a greater extension of mining operations aud another era of local proeperity.

The east crosscnt on the north houndary line of Best & Belcher on the 900 level is out ahont 20 feet and is at present in soft porphyry. Since the Rule project has heen put nnder way this part of Best & Belcher has been an interesting quarter to the public. Should a hody of ore he found in the southern part of Con. Virginia ground, as a result of the Rule operations, a big impetue would be given to explorations in this portion of the Best & Belcher. There is much virgin ground here and a discovery of magnitude is entirely within the bounds of reason.

Some ore going nearly $35 per ton is heing taken out of the winze from the 1300 level of the Hale & Norcross. A small amonnt of ore going over $42 per ton is heing taken from the ledge ahove the 400 level of the Occidental. The Savage weekly prodnct of bullion reached $4271.40 last week—nearly a thousand dollars above the previone week. The average valne of the ore and the quantity milled were both greater.

Market Reports.

The Markets.

SAN FRANCISCO, NOV. 23, 1893.

The course of the silver market during the week has been a little uneven, hut no changes of consequence have occurred. There was a decidedly firmer tone toward the close of last week, hut Monday the New York price had dropped one cent. The market has since nearly recovered lost ground.

Silver Under the Sherman Law.

Director Preston of the Mint has prepared a statement showing the amount and cost of the silver purchased under the act of July 14, 1890. From the date the act went into effect, Aug. 31, 1890, to the date of its repeal, November 2, 1893, 168,674,590 fine ounces were bought, costing $155,930,940, the average cost per ounce being $0.9244. Of the amount purchased $36,087,285 worth was coined into standard silver dollars, leaving 140,699,760 ounces on hand. This amount will coin $181,915,000.

Exports of Quicksilver.

During the past ten months 6450 flasks of quicksilver went to New York alone hy sea, this quantity being only 298 flasks less than the total exports for the same period in 1892. Mexico, Australia and Central America are also running ahead this year.

On Tuesday the steamer China took 1300 flasks for Hongkong. One thousand flasks were manifested at $30 per flask (reported to be old metal) and the other 300 at $40. These are the first shipments from here to Hongkong since 1890.

The Metals.

Copper has advanced and is now in firmer tone. Lead has likewise gone up a little, yesterday's quotation being $3.40.

Silver and the Metals.

NEW YORK, Nov. 23.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, Nov. 23, 1893.

Toward the close of last week there was a decided falling off in the recent activity in mining stocks; hut there was a renewal of speculation with the present week. The market opened strong and active Monday, and prices showed a continuous advance. No particular stock was the favorite, hut the whole market showed a healthy advance. The weekly reports did not exhibit any particular change.

In the Pacific Board there was a desire to sell hy the leading members, hut on the 9:30 A. M. call of the hig Board the huying orders of Marks, Paxton and Epstein gave a different aspect to the market. Con. Cal. & Va. sold at $3.60; Ophir $1.60; Curry $1.15; Best & Belcher $2.30; and Savage 95c. These figures were changed for the better on subsequent calls, and there was quite a hoom in the closing prices, which showed another advance all along the line.

Local hears who shorted Con. California & Virginia at $3.55 Monday saw it touch $4.75 Tuesday, and they also saw Best & Belcher, which they had sold at $2.25, reach $3.30, and had to face a proportionate increase in the prices of other stocks which they are short upon. They had done their best to keep the market down, hut finally many of the short sellers were forced to fill. Toward noon the extremely high prices to which the shorts had carried the market gave way to a lower range of quotations.

Wednesday the Comstock market opened with quiet strength and was well sustained, with small fluctuations, up to noon. During the morning, Consolidated California & Virginia rose to $4.65, against $4.35 at Tuesday's close, and Best & Belcher, Ophir and all the other favorite stocks held up firmly. The working force in many of the Comstock mines will soon be increased. It is understood that operations at the old Alpha Con. shaft will soon be resumed. This will impart more activity to operations in the middle mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 14, 1893.

503,860.—FRUIT-WASHER—D. E. Barton, Los Angeles, Cal.

503,408.—FRUIT BASKET—Thos. Cogswell, San Diego, Cal.

508,599.—HOISTING BUCKET—Thos. Cogswell, San Diego, Cal.

508,816.—LADDER—L. D. Craig, S. F.

508,819.—ICE-CUTTER—Leo Datt, Seattle, Wash.

508,417.—PENCIL—A. M. Cruhbs, Forest Grove, Or.

508,473.—GAME TIME CHECK—C. B. Hopkins, Spokane, Wash.

503,618.—OAR-ENGINE IGNITER—O. E Hoyt, S. F.

508,477.—OIL-CAN LOCK—C. H. James, S. F.

508,834.—GAME—W. D. Pickens, Portland, Or.

508,779.—CAR COUPLING—F. A. Stevens, Sacramento. Cal.

508,464.—CALENDAR—H. L. Wead, Spokane, Wash.

508,792.—SEPARATOR—Wheelan & Jessup, Santa Barbara, Cal.

508,589.—EARTH CARRIER—J. J. Wishard, Watsonville, Cal.

22,911.—DESIGN FOR LAMP STOVE—J. F. Myers, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BEAM OR GIRDER SUPPORT.—Francesco Cavallero, of San Jose, Cal. No. 508,280. Dated Nov. 7, 1893. This invention relates to a device for snpporting the ends of beams or girders which abnt against the sides of other beams or girders at an angle thereto. It consists of a plate or snpport adapted to fit npon the snpporting beam and be bolted thereto, and having a projecting socket-piece extending therefrom at any desired angle, and adapted to receive the end of the abntting girder which is to be snpported thereby, and at the same time retaining the npper snrfaces of horizontal girders flnsh with each other. Roof girders are snpported in the same manner at any desired angle with the snpporting beam. The device is so constructed that it may be attached to beams already in place and propsrly secnred, thereto.

CAR COUPLING.—Fred A. Stevens, Sacramento, Cal. No. 508,779. Dated Nov. 14, 1893. The object of this invention is to provide an antomatic conpling for cars in which the parts of the conpling are prevented from separating accidentally. The draft, when the two parts of the conpling are engaged, is in a direct line with a tendency to hold the parts of the conpling close together. Esch conpling comprises bnt three pieces which are ready to be pnt together withont any tool work or finishing. The conplings are constructed with a head or extension on the top and bottom of the chamber so as to prevent their being lifted above or dropped below the other conpling so far as to disengage while allowing all necessary vertical movement. It also serves to hold the conpling and draw-bar and prevent its falling to the grond in case it is pnlled ont of the car hy accident. The two parts are readily disengaged at any time, and the conpling is exceedingly simple, strong, and easy to make with little or no likelihood of its getting ont of repair.

PRESERVING PILES.—James Cass, Cayucos Landing, Cal. No. 508,279. Dated Nov. 7, 1893. This invention relates to the art of preserving piles and other submerged wooden strnctnres to prevent the ravages of marine worms and insects. It consists of first stripping the bark from the pile, then coating it with a snitable wsterproof componnd, preferably of a poisonons nature, then covering this componnd with a layer of ship's felt or similar material, over this a layer of sheet lead, and finally a series of vertically disposed battens secured by hoops or in other snitable manner. This protection extends from a point below the mnd in which the pile is driven to a point above the water, and will prevent the insects from attacking the pile or other structure.

SEPARATOR.—Fairfax H. Wheelan of Santa Barbara and Robert W. Jessnp of Los Angeles, California. No. 508,792. Dated Nov. 14, 1893. The object of this machine is to separate the different particles of material according to the difference in their thickness and, incidentally, according to their ronghness. It is especially applicable to the cleaning of Lima beans and other seeds, by the separation therefrom of particles of dirt and seeds which differ from the heans and seeds to be saved, both in thickness and ronghness. The machine consists of a vertically rotating disk, a gnide-board set at an angle to the plane of the disk and on its nprising side, said board having its lower edge separated from the face of the disk, providing a discharge aperture, and a feeding device for snpplying the material to be separated to the guideboard. The effect of this arrangement is as follows: On acconnt of the lateral inclination of the board, the beans, seeds or other thin material to be saved are tnrned np edgewise and, heing thin, will pass down throngh the opening between the lower edge of the board and the side of the disk; bnt the material to be discarded, snch as dirt and other foreign matters, or other seeds which differ essentially in shape from the seeds to be saved, will not pass down throngh the opening, bnt will, hy contact with the nprising face of the continnonsly rotating disk, be gradnally worked off along the length of the board nntil they reach the lower end and are discharged.

Cal. Debris Commission Notices.

NOTICE—THE CALIFORNIA DEBRIS COMMISSION having received petitions to mine by the hydraulic process from John Spaulding, in the Polar Star mine near Dutch Flat, and to deposit tailings behind a dam in Little Bear River; from Nathan Gardiner in the Red Hill mine near Ono, Shasta Co., and deposit tailings behind dams in Wash Pan Gulch; from A. Denmire, in the Denmire mine near Cold Lake, Sierra Co., to deposit tailings in an old hydraulic pit, gives notice that a meeting will be held at the office of the Commission, room 92, Flood Building, San Francisco, on December 12th, 1893, at 1:30 P. M. On or before this hour and date all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission. W. H. Heuer, Corps of Engineers, U. S. A., Secretary of the Commission.

Assessment Notices.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees held on the fourteenth day of October, 1893, an assessment (No. 72) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, Room 69, Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of December, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

Notice is hereby given that at a meeting of the Directors, held on the 22d of November, 1893, an assessment of $2 per share was levied upon the capital stock of the Corporation, payable at the office of the company, to the Secretery, on the 22d day of December, 1893.

Any stock upon which this assessment shall remain unpaid on the 22d day of December, 1893, will be delinquent and advertised for sale at public anction, and unless payment is made before will be sold Monday, the 8th day of January, 1894, at the office of the company, at 1 o'clock P. M. of said date, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

MORGAN BACKUS, Secretary.

Office—408 Sacramento St.

FOR SALE CHEAP.

MINING AND SCIENTIFIC PRESS.

The Leading Mining Journal in America, Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & CO., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed hy this old, well-tried and experienced firm.

THE ORIGINAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices of a good safe engine is what you need.

The Oriental Launch is Perfection.

Two Curious Formations.

Extract from Report of W. H. Storms, Assistant in the Field, in Eleventh Report of State Mineralogist.

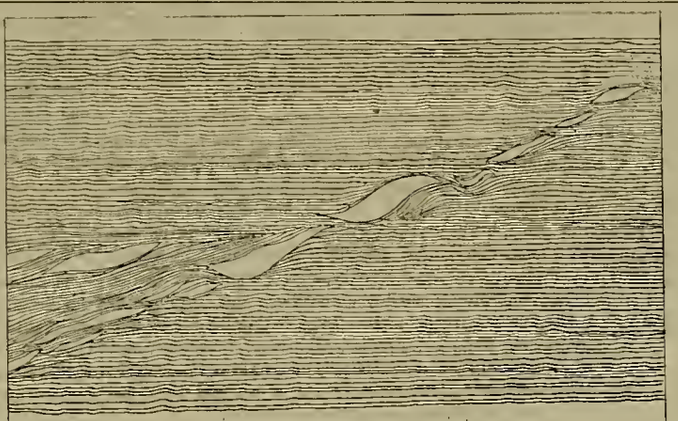
The Helvetia, like other mines near Julian, San Diego county, occurs in the crystaline schists, the quartz heing found as lenses inclosed in the conntry rock. Some of the lenses might be mistaken for fissnres, bnt I failed to see one possessing the charaeteristics of a "fissure."

Nearly all the lenses exhihit a tendency to "make" into the hanging wall side of the country rock, the lenses of qnartz following each other in a generaï direction, hut at an angle with the stratification of the schists, and are separate and distinct from each other, being separated at the ends (where they sometimes overlap) by the "leaves," as they may be termed, of the schistose country rock. These lenses were doubtless caused by a compressive stress on the schists, which had a tendency to split them, hut was not powerfnl enongh to cause an ahrupt fracture. The accompanying sketch may convey an idea of the occurrence of these qnartz lenses.

By the accompanying sketch it will be observed that there is a tendency on the part of the quartz lenses to follow a given direction, which lies at a small angle across the strike of the schists, and that these lenses are not connected, hut occur independently, though all are the result of the same force which flexed and split the strata.

The Ready Relief, near Banner, has several levels, all of which are connected hy winzes and shafts. The huge hunches of qnartz have, from their peculiar form, heen denominated "rolls," and I know of no hetter term which wonld convey a clear idea of their appearance. As a result of close observation made at numerous points in the mine and on the surface at the time of my visit, I formed the conclusion that the "rolls" of the Ready Relief mine simply represent an exaggerated condition of the same sort of flexing of the schists that has produced the other mines of this district. The facts as observed lead me to the belief that the "rolls" or folds of the Ready Relief mine, and its extensions, both north and south, are the result of a severe compressive stress upon the schists at right angle to a line running nearly northwest and southeast; that this force was exerted in the form of pressure and not of contraction; that as a result of this pressure there is a tendency exhihited on the part of the contorted strata to form a reverse fault and not a normal one, and that this power expended itself hefore the rocks were forced to yield to the strain to the extent of fracture, the result heing an abrnpt crumpling of the schists without disruption.

Along this line of disturhance percolating waters have deposited silica in enormous quantities. The schistose folded masses having heen completely metamorphosed, massive quartz replacing the crushed and crumpled crystalline rocks, though the lines of its former schistose structure are in many places preserved.



LENTICULAR QUARTZ BODIES IN SCHISTOSE ROCK

REMARKABLE VEIN FORMATION
READY RELIEF MINE
AT BANNER SAN DIEGO CO.

A sketch of a characteristic section is here reproduced, and it may help the reader to form some conception of this unusual occurrence of gold-bearing quartz. The strike of the country rock is about northwest and southeast, and varies hut little from this over a wide area. The rock is, generally speaking, a dark gray, rather close-grained, micaceous rock (argillite), having a dip to the east of about 80 degrees. The succession of folds cut across the dip of the schists at an angle of about 45 degrees from the horizon.

It will he noticed that in places several of the rolls lie side hy side. Where this occurs the pay shoot is very large. The thickness of the individual rolls varies from a few inches to 5 or 6 feet, and where the folds parallel each other a width of 12 to 20 feet or more is not uncommon. These rolls do not extend longitudinally a great distance, hut seem to gradually diminish, heing followed hy others along the strike of the vein. It seems quite evident that had the stress which produced this folding or crumpling of the schists proceeded much farther an abrupt fracture must have resulted, and the Ready Relief vein would have heen a fissure having a dip of ahout 45 degrees.

IT IS INTERESTING to learn, from a statement hy Senator Perkins, that it was the purpose of Congress in its passage of the hill suspending assessment work on mining claims for 1893, to exclude non-residents from its benefits; in other words, that none other than *bona fide* residents of the States or Territories within which their several mining claims were situated would he favorahly affected hy the Act. Senator Perkins last Tuesday morning notified the MINING AND SCIENTIFIC PRESS that a provision to that effect had been agreed upon in conference between the House and Senate, and that it must therefore have heen incorporated in the hill. He was persuaded that the copy of the law he, as well as Representative Bell of Colorado, had furnished this paper, was incomplete. It was almost incredible that such an error had occurred, hut the senator's recollection ahout the amendment was distinct. Tuesday afternoon, however, the senator received from his secretary in Washington an official copy of the Act, the text of which was exactly as heretofore published. The matter is thus definitely set at rest. The official record of course stands.

LETTERS continue to arrive from South African immigrants declaring that no more grievous error can be made than to leave America at this time for either the Transvaal or Kimberly. Skilled mining engineers and a limited number of experienced amalgamators and millmen get good pay in the Transvaal, but the ordinary miner has an infinitely better chance in California. This class of lahor in South Africa is almost exclusively performed by hlacks. They will not be supplanted hy white labor.

San Francisco, December 2, 1893.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Remarkable Vein Formation; Lenticular Quartz Bodies in Schistose Rock, 373. Bird's-Eye View of Exposition and Grounds, 357. Hydraulic Ejectors, 359.
EDITORIALS.—View of the Midwinter Fair, 357. The Proposed Tariff; Miscellaneous, 373-374.
CORRESPONDENCE.—River Protection and Hydraulic Mining, 374.
MISCELLANEOUS.—On the Artificial Production of Petroleum; A New 100-Ton Furnace in Australia; The New Coolgardie Field, 358. Hydraulic Ejectors; Where to Dig for Gold and How; The Transvaal Boom, 359. Two Curious Formations, 373. Foundry Notes, 375; Silicons; Book Notices; Loss of Gold by the Cyanide Process; Tin Mining, 376.
SCIENTIFIC PROGRESS.—Barnard on Astronomy; Powerful French Telescope; Movement of Diamond Molecules; Meteors, 360.
MECHANICAL PROGRESS.—Canal Cutting and Dredging on the Sacramento; The Zalinski Dynamite Gun; Coal Oil in Steam Boilers; A New Pumping Jack, 360. An Indiana Man's Wonderful Clock, 361.
ELECTRICITY.—The Hydrograph; New Steel Alloys; Days of the Tow-Boat Over; Electric Cooking at Half Price; Electricity Fires Benzine; An Electrical Dredge, 362.
USEFUL INFORMATION.—Ships Lost at Sea; Remedial Use of Apples; The Physical Strain Involved in High Speeds; Round Shoulders Cured, 362. The Lord Mayor of London; Artificial Leather, 363.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 365-366.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 367.

THE Eastern press does not seem prepared to realize the extraordinary efforts being put forward to complete the buildings at the Midwinter Fair site. For instance, our valued contemporary, the *Engineering and Mining Journal*, of November 18th, contains the following inadequate notice:

Contracts have been let for two of the buildings for this exposition at San Francisco, and the site is now being graded ready to begin work. The main building will be 450 by 200 feet, and the Mechanical Arts Building 275 by 175 feet. A tower 266 feet high is to be erected on the grounds. Many exhibits have already been promised, including a fine electrical display. The mining interests of the State of California are also making preparations for a large exhibit.

At the time the foregoing paragraph was written the contracts for all the great buildings were let, and work was advancing rapidly on them and a large number of others. The first large buildings have been for many days under cover. Work has been going forward for weeks on a large number of smaller buildings. There are something like seventy, completed, under way or projected, today. There will doubtless be more to-morrow.

THE Parrot copper mine at Butte, Mont., has again started up, and a continuous run for the winter is assured. It is reliably stated that the principal reason for starting up is that the Anaconda company has contracted with the Parrot company for the refining of 1000 tons of copper matte per month for a period that extends over six months. As this would not be sufficient to keep the smelter going all the time, the Parrot people concluded to work in their own ore in the meantime. It is said also that the Moscow and Virginius mines will again open up. The Parrot mine produced in 1892 over 12,000,000 pounds of fine copper.

THE following interesting statement is made in the monthly report of James Lewis & Sons of Liverpool:

"A statement issued by the Boston & Montana Company gives the excess of liabilities over assets on the 30th of June as $450,519, which was converted into an excess of assets over liabilities on the 30th of September of $205,345."

In other words, notwithstanding the great depression in copper, one Montana producer in three months turned a deficit of $450,519 to a surplus of $205,845. This gratifying result is a tribute to the value of the Boston & Montana property and to its management.

AN interesting case has just been decided by Superior Judge Ellsworth of Alameda county. The heirs of Egbert Judson and J. L. N. Shepherd were given a judgment of $40,168 against the Giant Powder company, arising out of the great powder explosion in July, 1892. Shepherd & Judson were conducting the business of their own near the powder magazine, and their buildings were entirely obliterated by the explosion. They asked $80,000 damages. The legal battle was hard fought. The case will be appealed.

ANGELS, Calaveras county, now claims a population of 2500.

The Proposed Tariff.

The tariff bill prepared by the Ways and Means Committee of the House of Representatives has been reported. It makes many sweeping changes in the present tariff, substituting ad valorem for specific duties wherever practicable, and reducing existing rates in a vast number of cases. It is altogether the most radical tariff for revenue means proposed in recent years. It affects every branch of industry, mining in many important particulars. It was expected that lead-silver ores were to be added to the free list, but a remnant of duty is still retained. The provision is as follows:

Lead ore and dross, 15 per cent upon the lead contained therein, according to assay at the port of entry; provided, all ores containing silver and lead in which the value of the silver shall be greater than the value of lead shall be considered silver ores.

Lead in pigs and bars, molten and old refuse lead run into blocks and bars, and old scrap lead, fit only to be manufactured, 1 cent a pound.

It will be seen that instead of a specific duty on lead ores containing more lead than silver, 15 per cent upon the lead contained therein is imposed. The duty is now 1½ cents per pound. The value of lead is about 3½ cents, and the present duty is really over 40 per cent. The reduction is therefore 25 per cent. The duty on pig lead, etc., is now 3 cents per pound. It is to be made 1 cent, a 50 per cent reduction.

In addition to the above, copper ores, old copper, clippings from new copper, all compositions in which copper is the chief component of value, regulus and black copper and copper cement, copper plates, bars, ingots, pigs and other forms; sublimated iron ore, including magniferous iron dross, burnt pyrites, sulphur or pyrites in natural state, mica and crude metallic minerals and unwrought metals, ochre and ochery earths, sienna and sienna earths, umber and umber earths, quicksilver, salt, sulphate of soda, or salt cake or nitrate cake, burrstone bound into millstones, freestone, granite, sandstone, limestone, and other building or monumental material except marble undressed, coal—bituminous, block or cut, and coke, are all on the free list, beginning March 1st next.

It is a matter of conjecture only in what shape this bill will pass Congress, if it passes at all. No doubt it will be severely attacked, not only by Republicans but, in various particulars, by members of the dominant party whose interests it affects.

The proposed tariff will, it is feared, have a disastrous effect upon the quicksilver industry. The present duty is $7.65 per flask, and the price of quicksilver is $40.50, making the ad valorem tariff over 15 per cent. With the mines of California working extremely low-grade ore (the New Almaden as low as 1.2 per cent) the margin of profit at present prices is very slight where it exists at all. During 1892 the average San Francisco price of quicksilver was $38.80 per flask of 76½ pounds; the average London price was $31.90 (£6 14s), a difference in favor of the United States of $6.80. It seems obvious that if the duty is removed a part of the Spanish output will seek a market in the United States in preference to London. With the shutting down of many silver mines the quicksilver market in the United States has been restricted, and nothing but the diminution of the product has allowed maintenance of prices.

THE Deputy Collector of Customs on the American side of the Kootenai river is reported to have made a singular ruling. Heretofore it has been customary to pass ore through to the smeltere, awaiting the invoice returns before collecting the duty, as it is impossible to ascertain the percentage of lead or the valuation in any other manner. The railroad companies and the smelters being under bond to make accurate returns, and the collection being fully guaranteed, there is no probability of loss by this method. But it is said that the Deputy Collector now insists upon collection in advance, on the basis of 50 per cent lead, and should the smelter returns show a higher percentage the owner must pay duty on the full amount, but in the event of a shipment falling below 50 per cent, the Government, as impersonated by this official, will not return the excess of duty paid.

GOVERNOR WAITE has called a convention of resident miners and mine-owners of certain silver mining towns in Colorado to meet in Salida, December 6th, for the purpose of discussing extra session of the legislature. At that meeting the Governor will present his plan of relief, and then a vote will be taken to decide whether or not an extra session shall be called to act upon the Governor's plan, whatever that may be. This vote will decide the Governor.

THERE is not at present a single mine in operation on the Gogebic range, a region that mined something like ten million tons of iron ore last year. Altogether, about 15,000 people are in a helpless condition. Measures for relief have been devised.

River Protection and Hydraulic Mining.

Senator Ford's Rejoinder to Mr. Ohleyer.

[Mr. George Ohleyer recently contributed to the Sacramento *Bee* a reply to Senator Ford's article on "River Protection and Hydraulic Mining," which appeared in the MINING AND SCIENTIFIC PRESS November 4, 1893. The substance of Mr. Ohleyer's paper is that Mr. Ford is a lawyer and his argument entitled to be considered only as a lawyer's brief; that commerce does not need the gold contained in the gravel beds; that no other factor except hydraulic mining has contributed to detritus in the streams; that non-hydraulic streams remain the same as before the advent of the monitor; and that hydraulic mining is a beast and monster, anyway. The salient points of Mr. Ohleyer's arguments are stated clearly and fairly in Senator Ford's reply which follows.]

Those who have not followed the subject of river protection and hydraulic mining through its varying phases have not always understood upon what ground the Federal Government is asked to appropriate money for the construction of works to restrain and impound mountain debris. In answer to inquiries in this regard the undersigned recently contributed an article to the MINING AND SCIENTIFIC PRESS, wherein it was attempted to enumerate some of the known causes that had led to the filling up of our navigable streams, and to point out the plan adopted by both Congress and our State Legislature for preserving our rivers without injury to either the farming or the mining interests. As premises, two propositions were laid down which the writer supposed would be universally conceded. They were thus stated:

"It goes without saying that the navigable streams of California must be protected. It is also true that commerce needs the millions of gold now locked up in the hydraulic gravel beds in the Sierra Nevada mountains."

The writer, therefore, confesses to some surprise that the second of the above propositions should be combated by so able and intelligent a writer as the Hon. George Ohleyer of Sutter county. In the Sacramento *Bee* of Nov. 18th Mr. Ohleyer criticises at considerable length the article in the MINING AND SCIENTIFIC PRESS, above referred to, and, among other things, says, with reference to the proposition that commerce needs the millions of gold now locked up in the hydraulic gravel beds:

"It is not clear that commerce needs the asserted millions to be washed out by the hydraulic process. The commerce of the world has always been supposed to be based on agriculture, and never on mining for the precious metals. The gold taken from the gravel beds of California and Australia may have quickened the trade of the antipodes, but, true to history, both ancient and modern, it left the countries impoverished, and, where preserved, it was by agriculture and the commerce it engendered."

With all due respect to the learning and ability of Mr. Ohleyer, it is submitted that the commerce of California would at least be "quickened" by the addition of a few millions of gold to our circulating medium. The writer is willing to leave this branch of the question to the business men of Sacramento and Marysville, with the belief that their judgment as to the "quickening" influence of gold is of far more value than that of the writer.

Mr. Ohleyer next criticizes the writer's statement concerning the effect of artificial banks or levees upon our navigable streams. His argument seems to be that the levees do not in any degree contribute to the filling up of the rivers with debris washed down from the mountains, but that hydraulic mining is solely responsible therefor. In fact he says that "the channels of the non-hydraulic streams remain practically the same as before the advent of the monitor, nature never having overburdened them." Let us see if Mr. Ohleyer is really correct in his views. That portion of the Sacramento river above the town of Colusa is certainly a "non-hydraulic" stream; yet, as a matter of fact, there is nowhere a better illustration of the very effects suggested in the article complained of than in this same "non-hydraulic" stream. In the Sacramento weekly *Bee* of Nov. 15th is a most interesting and scientific article from the pen of one of the most gifted writers on the Pacific Coast and one of the most ardent advocates of river protection in California. Mr. Will S. Green is the author, and there is probably not another man living so thoroughly acquainted with the upper Sacramento and its tributaries and adjacent lands. Mr. Green's article is devoted to a discussion of river protection and low-land drainage, and, in the course of the article, he says:

We are leveeing a gravel-carrying stream. *This is the most important factor in the problem.* A stream which carries gravel and coarse sand is necessarily a fast builder of land. Down to Colusa the river has vibrated between hard-pan banks that average about a mile and a half apart. The levees have been built on these hard-pan banks. Between the levees there are low bushy bends or sand-bars. The levees have grown—mostly since 1862—and the line of the high water at Colusa has been raised between six and seven feet, *and the low bends, that have been reservoirs for the deposit of coarse material, are now, in many places, higher than the banks that did not overflow in 1862, the great high water year. Stick a pin here, and we will come back to it presently.*

Further along in his article Mr. Green says:

Now, let us go back to our pin. As I have said, a stream that carries coarse material must, of necessity, be a fast builder of land. *The rapid filling in of the bends between the levees above Colusa proves we must do something with this material.* It must go to the building

up of land, and we must make our outlet with that in view. [Mr. Green refers to artificial outlets from the river into a drainage canal through the low lands between the river and the foothills.] There must be frequent outlets into the main canal from the upper river, and they must be wide. They will fill up, and must be moved, so there will be a perfect system of land-building that will go on indefinitely. [The italics are ours.]

Thus it seems that even in "non-hydraulic" streams the mountain debris will find lodgment between the artificial banks or levees, necessitating constant additions to them, as suggested in the article complained of. Napa creek, Stony creek and numerous other streams might be cited in illustration of the work of "non-hydraulic" streams in bringing debris down from the mountains. The fact is as stated in the article in the MINING AND SCIENTIFIC PRESS: "The work of depositing detritus from the mountains and foothills in the valley streams and upon adjacent lands began centuries before hydraulic mining became a recognized industry, and unless checked by the application of appropriate means, under governmental direction and authority, will continue for centuries after the last gravel-bed has disappeared from the auriferous regions of California." The building of levees has not lessened the flow of detritus from the mountains, but it has confined the material brought down to narrower limits, and, while protecting adjacent lands, has caused the streams to fill up between the levees, which, as Mr. Green well says, "proves we must do something with this material." Engineering experiments have clearly shown what that "something" is that must be done. But of that later on.

Just here a misstatement of Mr. Ohleyer's may be noticed. It is not to be presumed that Mr. Ohleyer intended any misrepresentation, and he will, of course, hasten to acknowledge his error. By reading the article complained of carefully he will readily see that the writer expressed no such opinion as that the construction of levees was a mistake. The statement there made was that the levees cut off all means of escape through sloughs and other natural outlets, and confined the debris-laden waters within the confines of such levees. That was the the statement of a fact that is well known, and the result thereof is clearly stated by Mr. Green. But, in addition to the above statement, the writer was careful to add that "no one would ask for the removal of the restraining levees, notwithstanding their constant tendency to choke up the rivers with accumulated sediment."

It is also to be regretted that Mr. Ohleyer deemed it necessary to fortify his argument by the use of such epithets as "beast" and "monster" in referring to the hydraulic mining industry. Vituperation is not argument, but rather indicates a lack of it, and can serve no other purpose than to keep alive a prejudice that is rapidly dying out, and which, it is hoped, may never again be revived. The people of the valleys and of the mountains have important interests to conserve and important matters to engage their mutual attention, and they cannot afford to waste their time in useless bickerings or profitless quarrels.

Now we come to the real matter in hand, namely, the preservation of our navigable streams without the destruction of established industries; a matter that seems to have entirely escaped the attention of Mr. Ohleyer.

As was stated in the article in the MINING AND SCIENTIFIC PRESS, it is the plain duty of the General Government to protect its navigable waters—a duty fully recognized by the Federal authorities. Nor should the Federal Government be wholly unmindful of those to whom it has sold its public lands. The farmer is entitled to whatever protection the Government can reasonably afford him, and will, of course, reap the benefit of whatever means may be adopted by the Government for the protection of the streams, for the protection of the streams will mean the protection of the adjacent lands; and the hydraulic miner, who purchased his land from the Federal Government, with the full knowledge on the part of the Government that the land thus purchased was to be mined by the hydraulic process, is entitled to some consideration at the hands of those who make and enforce our Federal laws. Much has already been done in this behalf and the State and Federal Governments both stand committed to the same line of action.

Let us note briefly just what has been done, and, in the language of the member from Georgia, ascertain just "where we are at."

First—Engineering experiments have demonstrated that it is practicable to construct restraining works and settling basins that will effectually impound all debris, from whatever cause arising, that could work any material injury to the navigable streams or adjacent lands. Furthermore, the matter has been the direct subject of judicial investigation, and a decree rendered by the United States Circuit Court for the district of California in the case of United States vs. North Bloomfield Mining Company, in October of last year, at San Francisco, determined that not only could such works be constructed, but that one of the largest hydraulic mines in California had in fact constructed works capable of doing all that was necessary for the protection of the rivers and adjacent lands. Upon this point the Court say:

"There are three objections urged against the operation of this impounding reservoir. First, that it does not successfully remove from the water the material which is carried in suspense, and that the water that escapes by the cribs takes with it material which becomes deposited in the lower streams and injuriously affects the navigability of the same."

Concerning this objection the Court say:

"Upon the first of these objections the evidence, although voluminous, is not to any considerable extent conflicting. The water that escapes through the cribs is discolored with very fine particles of comminuted clay which are held in suspense. It is impossible that water that has once fairly come to rest in the pool, and has then been drawn off from the surface through the cribs, should carry with it any sand or anything other than the lightest material. The evidence goes to prove that the fine clay held in suspense in the water, and which causes its discoloration, is of specific gravity very little greater than water, and that it will remain in suspense so long as the water moves with the velocity of a mile in two hours.

"The evidence further shows that this material is carried in a state of suspense through the Yuba, the Feather, and the Sacramento rivers, and into the ocean. It does not appear that at any point on those streams the water comes to rest, or that the clay which it carries is deposited in any appreciable quantity.

"After taking into consideration all of the evidence, I am convinced that after the water which conducts the mining debris shall have once come to rest so as to deposit all the sand and heavier material that is carried in suspense, leaving only the light, flocculent particles of clay, which gives it its color, no material will be subsequently deposited from it unless it is brought to rest, and so remains for a longer period than it has remained at rest in the impounding pool."

The dam referred to in the above decision was built mainly of brush and small trees and was raised gradually as necessity required. The works to be constructed under governmental authority, however, are to be of such material as will insure safety and permanency and are to be constructed under the direct supervision of United States Engineers from the War Department.

Second.—Following the principles laid down by the United States Circuit Court, Congress has mapped out a policy for the protection of the rivers that shall at the same time permit the business of hydraulic mining to be carried on under proper restrictions and limitations. The Caminetti Act, so-called, became a law on the first day of last March, and is now the highest law we have upon the subject of which it treats. This law provided for the creation of a commission to be known as the California Debris Commission, and to consist of three members of the Corps of Engineers of the United States Army. The commission are to grant permission to mine by the hydraulic process under the conditions named in the Act and are to make examinations and surveys with a view to the improvement of the rivers and the preventing of damage to them by debris resulting from mining operations, natural erosions, or other causes. The Act distinctly recognizes "other causes" than hydraulic mining as contributing to the filling up of the rivers. Among other things, the Act in question provides:

"That said Commission, in order that such material as is now, or may hereafter be, lodged in the tributaries of the Sacramento and San Joaquin river systems, resulting from mining operations, natural erosion, or other causes, shall be prevented from injuring the said navigable rivers, or such of the tributaries of either as may be navigable, and the land adjacent thereto, is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and in the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, which in the judgment of said commission will effect said object (the same to be of such material as will insure safety and permanency), restraining or impounding dams or settling reservoirs, with canals, locks, or other works adapted and required to complete the same."

The Commissioners are thus clothed with ample power to protect the rivers and adjacent lands from injury from the flow of mountain debris, whether such debris result from mining or other causes, and only need the funds necessary to enable them to carry this power into execution.

Third—Our own Legislature, at its last session, provided for the appointment of a Debris Commissioner and appropriated $250,000 to be expended under his directions and in conjunction with the work of the United States Engineers, whenever the General Government should appropriate at least as great a sum for similar purposes. Both the Caminetti act and the State act provide that the State and Federal Commissioners shall work in harmony and to the same end, and it only remains for Congress to make the needed appropriation in order to make both acts effective.

Fourth—Not only did our Legislature at its last session provide for the appointment of a Debris Commissioner to act in conjunction with the Federal Commissioners in restraining and impounding the debris that is washed down from the mountains and foothills, and thus prevent its reaching the navigable streams, but the Legislature went further and completed its work by providing for the appointment of a Commissioner of Public Works, whose duties are, in part, thus set forth:

"The Commissioner shall perform such duties in the examination of lands subject to inundation and overflow by flood waters, and of the waters causing and making such inundation and overflow, and in the preparation of plans and estimates of cost for work to regulate and control such flood waters, as he may be directed to perform from time to time by the Governor, etc."

Thus we have a complete, perfect and harmonious system, wherein the State and Federal authorities join hands in the prosecution of a work that cannot result otherwise than beneficially to the commerce of California. The debris washed down from the mountains, from whatever cause arising, will, when necessary, be permanently lodged and impounded behind Government works built along the mountains and foothills where nature has provided an abundance of storage sites of unlimited capacity; the rivers, relieved in part of their ancient burden of debris, will be improved and their carrying capacity augmented; the flood waters will find means of escape through artificial outlets and canals; and the lowlands of the valley will be drained and made to yield their quota to the resources of a great State.

It is too late now to cry halt. The valleys and the mountains have joined hands in a great work and have assurances of aid from both the State and the Nation in carrying that work to a successful conclusion. All interests and all industries will be carefully guarded and protected, and the contentions and prejudices of recent years will melt away before the returning prosperity that will smile over mountain and valley. Improved rivers will bear the burdens of an augmented commerce, while added millions from the mines will "quicken" the trade and life of our commercial centers. Let us, then, hope that the voice of the pessimist will no more be heard in the land; that no one will be found standing in the way of commercial and industrial progress, but that with one common aim and one common purpose, and regardless of locality or occupation, we may all strive for the upbuilding of every section and every industry of our great and richly-favored State.

TIREY L. FORD.

Foundry Notes.

THREE McGlew concentrators have just been shipped to Madera county, for Spencer & Sharp, at French Gulch.

THE cruiser Olympia has demonstrated that she is a record-breaker. For several days last week and at the beginning of this she was out on her official trial, in Santa Barbara channel, but from a variety of causes (mostly weather) she has been delayed. Last Friday, during a burst of speed, she covered a mile of water at the astonishing rate of 26.12 knots, or over 30 miles per hour. It is believed now that the Olympia will beat the Columbia's average of 22.8 knots for a four-hours' run. The Union Iron Works will no doubt earn a large bonus.

A VERY LARGE centrifugal pump has just been cast at the Byron Jackson foundry. The pump appears to be a prodigious conch shell, with a turbine wheel in it. It stands over 12 feet high. The bed plan occupies a space of about 14x18 feet. It is estimated that the engine will give as much work as a triple-expansion engine of the same horse power, there being no valves and no loss of steam by radiation. The steam connection is direct, and the governor and automatic cocks of the condensing chamber are newly patented. The whole plant shows great strength and solidity. The pump-shell cast weighs about five tons, is seven-eighths of an inch thick and has a capacity of 50,000 gallons per minute through a 44-inch outflow. This is one of two which will be used by the Summit Lake Water Company to pump water for the irrigation of a large area of land in Fresno county.

THE following rules governing the supply of lighting and power are published for the information of exhibitors and concessionaires at the Midwinter Exposition:

All wiring must be suitable for the class of current the exposition is able to furnish. Lamps may be supplied with a current from 100-volt A. C. circuit, 500-volt D. C. circuit lamps in series, and a limited number from 100-volt D. C. circuit.

Information concerning the class of circuit for any location may be obtained from the electrical engineer.

Current for arc lamps will be furnished at the rate of $65 per lamp of 2000 nominal candle-power, from the opening of the exposition, January, to its close, for a period not to exceed six months.

Consumers of light will be charged the actual cost of installation of arc lights and for all breakages. The exposition will furnish carbons and service.

Incandescent-lamp service will be furnished for the period of the exposition at the rate of $8 per 16-candle-power lamp; this is to include the first lamp. Renewals and breakages must be furnished by the consumer. The consumer will furnish all fixtures and shades for the wiring of lamps.

Special agreement must be made for colored or fancy lamps, or lamps of other than 16-candle power. Special discount will be made for service for installations of 50 or more lamps.

Power for motors will be furnished at the following rates for the period of the exposition:

For one-fourth horse-power and less	$15.00
For more than one-fourth horse-power, and not exceeding one-half horse-power	30.00
For more than one-half horse-power, and not exceeding one horse-power	50.00
For more than one horse-power, and not exceeding two horse-power (per horse-power)	45.00
For more than two horse-power, and not exceeding three horse-power (per horse-power)	42.50
For more than three horse-power (per horse-power)	40.00

A limited amount of power may be furnished to exhibitors free of charge to simply turn over otherwise inoperative exhibits, exhibitors to furnish all necessary motors, rheostats, switches, belts, countershafting, wiring, etc., necessary for connecting motors with main wires and operating machinery.

Motors must be suitable for operation of class of circuit furnished in exhibitors' location. All rheostats must be constructed of wholly non-combustible material.

THE activity in gold mining extends to southern California as well as northern. Several Montana miners have recently arrived at Los Angeles, and will engage in a systematic hunt for gold.

Losses of Gold by the Cyanide Process.

Dr. A. Simon of Johannesburg, South Africa, in a lecture on the loss of gold by the cyanide process, related experiments he had made with a view to find out how the loss of gold in treatment by the cyanide process occurred. All knew that there was a great difference between the theoretical and the practical results. The theoretical or assay results showed a certain amount of gold extracted from the tailings they were treating, but the practical results invariably showed a short-fall on this. A certain quantity of gold was lost in treatment, and he had endeavored to find out how this loss came about. He thought that the material used in the plant to a certain extent could account for it, and also for the abnormal loss in cyanide. In order to ascertain this he tested the filtering material first. The various filtering cloths now in use on these fields were subjected, under similar conditions to those in the cyanide works, to cyanide solutions, and the tabulated statement printed below showed the decomposing action of the various filtering cloths on the cyanide solution:

RESULTS OF EXPERIMENTS.

Pure Cyanide.	Ashestos.	Sackiog.	Cocoaoui Mattiog.	Jute.	Time io Hours.
0.5	0.5	0.5	0.5	0.5	0.5
0.5	0.5	0.495	0.49	0.5	2
0.5	0.5	0.49	0.48	0.475	4
0.5	0.495	0.485	0.465	0.49	6
0.5	0.49	0.48	0.45	0.48	8
0.5	0.415	0.47	0.44	0.475	10
0.485	0.45	0.41	0.32	0.44	30

Drawing conclusions from the tabulated statement, the speaker went on to condemn the cocoanut matting, which, he said, was in general use in South Africa at present. He certainly recommended sacking or jute, which were practically the same for filtering purposes, as the most advantageous. These experiments he had made with pure cyanide, but he had also made others with an admixture of cyanate and cyanide. All went to show that cocoanut matting was not advantageous as a filtering material. In one case, the adoption of asbestos was absolutely necessary, and that was in the case of highly acid tailings, and where tailings had been lying in the air for some time. In other cases jute would do. Generally speaking, where the cocoanut matting was employed, there was a greater short-fall in the gold as compared with the theoretical winning. He had also found that wood absorbed the gold to some extent, but this was not the only way in which gold was lost. The short-fall of the gold had never been satisfactorily explained. It could not be in the assays, as these had been very carefully made, and never showed a surplus. Even in cement tanks there had been a short-fall. The absorption only accounted for it in a small measure. He had made successful experiments in order to prevent the absorption by wood. He had painted the inside of the wooden vats with an iron salt, filling the pores with an iron precipitate not acted upon by cyanide, and by this means had to a considerable extent prevented the cyanide solution containing gold from penetrating the wood. The speaker then proposed a more elaborate system of filling up the pores, based on the above principles, by impregnating the wood under pressure with the iron solution.

Book Reviews.

"ORIGINAL PAPERS ON DYNAMO MACHINERY AND ALLIED SOBJECTA," by Jno. Hopkinson. W. J. Johnston Co. and Whittaker & Co., Pnblishers. For sale by Geo. W. Osborn, San Francisco. Price, $1.

Tbis little volnme comprises a series of papers by Mr. Hopkinson. Five relate wholly or in part to the continnous current dynamo. Four are on converters. Lastly, there is a note on the theory of alternate cnrrent machines and a paper on the applications of electricity to ligbthouses. The name of the anthor is a snfficient gnarantee of the thoronghness and valne of the work.

"PARLIAMENTARY TACTICS OR RULES FOR DEBATE," by Harry W. Hoot. By the Scientific Publishing Company, New York. Price, 50 cents.

This is merely an arrangement in handy form of rules in use in parliamentary form. Its chief valne lies in its index.

THE general form of license to mine issued by the Califoruia Debris Commission is coutained in the following permit of the Excelsior mine, Smartsville, Yuba county:

"By virtue of authority conveyed by the Act of Coogress approved March 1, 1893, the California Debris Commission hereby issues a permit to the Excelsior Water & Miniog Compaoy io mioe by the hydraulic process 3 7-100 acres of grouod in the Blue Gravel placer-mioiog claim, situated oear Smartsville, Yuba couoty. A cooditioo of this permit is that the detritus shall be securely stored io ao adjoining pit, subslaotially as stated io the applicatioo of Louis Coorath, attorney-io-fact of the Excelsior Water & Mioing Compaoy, dated September 23, 1893. This licooe is revocable io the discretion of the Califoroia Debris Commission."

A DISPATCH states that the Colorado gold output for 1893 will show an increase of 100 per cent over 1892. The figures for last year were $5,539,021. The increase would therefore be to $11,000,000, which is in the vicinity of Califoruia's average anuual output. We do uot expect to see the claim made good. While there will doubtless be a large iucrease from the gold fields, the gold by-product of the silver mines, which is nearly one-half the total, will show a heavy falling off. Colorado will have done very well if she is able to counterbalance this decrease.

Slickens.

THE White Diamond quartz mine is being opened np at North Bloomfield by local capital.

AT several points along the British Colnmbia frontier Chinese pretend to work in placer mines that they may be smuggled into the United States.

THE *Territorial Enterprise*, at Virginia City, for many years the leading paper of Nevada, after snspension for a year, is to be revived December 3d.

J. B. TREANWELL, the well-known mining engineer, has removed to Nevada City with his family. He will have charge of running the Gold Bsnk tnnnel.

IN reply to an inqniry from Riverside, Cal., the acting Secretary of the Interior has written that the department cannot grant permission to mine on the San Bernardino reservation.

THE Del Norte *Record* says that many of the idle lnmbermen in Del Norte connty intend going into the monntains this winter for the purpose of mining in the nnmerons creeks and canyons.

THE Liveoak and Minnet Mining Company has been incorporated. Principal place of bnsiness, Sau Jose. Capital stock, $500,000, witb A. McMahon, C. H. Clement, Byron Jennings, Giles E. McDongall and C. W. Conlisk of San Jose as directors.

THE Plumas *National-Bulletin* produces in bronze a facsimile of the official ribbon awarded for a collective exhibit of gold, silver, copper and iron ores. The diploma and medal will not come for some montbs yet. The ribbon will be exbibited at the Midwinter Fair.

WORK has been resnmed in the copper mines at White Clond, Nevada, owned by the White Clond Copper Mining Company, of New York City. The property was closed a sbort time ago, owing to the financial panic which was so severe in tbe East. Thirty miners are employed.

TWENTY STAMPS of tbe great 100-stamp mill of tbe Phœnix Mining Company started work Tnesday on the company's property, north of Phœnix, Ariz. Tbe mine has been opened extensively in the last ten months and will take rank as one of Arizona's main bullion prodncers.

THE Good Hope mine in Riverside connty has been sold to a Denver syndicate. It is the pnrnose of the new owners to begin the development of the mine, which heretofore has been worked in a small way. Machinery has been ordered, whicb is expected to be in operation by Jannary 1st.

GOLD discoveries have been made on what is known as Goose creek, in the western part of Colorado, not very far from the town of Sapinero. It is represented that these discoveries are wonderfnl in their richness, and tbat a great boom may be expected in the new camp in a short time.

RECORDER MERDOX of Sierra county has set a good example by having printed blanks giving notice that mining claimants desire to take benefit of tbe snspension act, and intend in good faith to hold and work tbe claim. They are distribnted free. The only expense attached to the miner is the cost of recording.

THE Rio Grande Western Railway is preparing to make an extensive coal and mineral exhibit at the San Francisco Exposition. Last year the coal traffic of this road reached 38 per cent of its total tonnage. This year it will be 50 per cent, and, with the exception of four Pennsylvania lines, it has the largest coal tonnage of any line in tbe United States.

A TELEGRAM reports the Novemher prodnct of tbe Alaska Treadwell mine at Donglas Island, Alaska, at $75,388 in gold. Tbe mill was rnn 29½ days, crusbing 19,170 tons. Tbere were 440 tons concentrations manipnlated, yielding $23,433, which is inclnded in the above total. The ore is low grade, bnt is economically handled, and hence yields fair profit.

THE statement is pnblished tbat the Mercnr Mining and Milling Company is making large profits throngh the workings of the cyanide process at its Utah mill. Tbe mill was pnt in the Mercnr last snmmer, and already two dividends of $25,000 each have been declared by the company, which, besides, have a large snrplns on hand. The Mercnr mine tnrns ont $26,000 net montbly.

SMELTER RETURNS to the cnstom bonse show tbat from Augnst 4th to November 1st inclusive tbe shipments of ore from the Slocan conntry by way of Bonner's Ferry aggregated 1,530,822 ponnds, or a fraction over 765 tons. The invoice valnation was $118,293, an average of $155 to the ton. Tbis is on the basis of 70 cents an onnce for silver. It is estimated that an eqnal amonnt went ont over the Canadian Pacific, bringing the aggregate ontpnt of the Slocan mines up to abont 1500 tons.

THE Occidental Mining company bas elected the following trustees: George R. Wells, Nat T. Messer, H. Zadig, E. B. Holmes and A. S. Wolberry. Mr. Wells was chosen president, and A. K. Durbrow secretary. A stock dividend of share for sbare was declared of the stock remaining in the treasury, npon the payment of 15 cents per sbare upon all assessment paid stock prior to November 27th. A cash balance of $237 was reported. From the 400 level, 10 tons of $39 ore is taken every week.

REPORT of the Harqnr Hala (Arizona) Mining Company for September shows the following: Tons crnshed, 2700; bnllion estimated to yield $32,000; expenses estimated at $10,000; estimated profit for the month, $22,000. Tailings—Samples were taken at intervals and show an average loss of $1.29 per tou. The yield per ton in bullion is eqnal to $11.85; the loss per ton in tailings is eqnal to $1.29; the valne of the ore milled therefore eqnals $13.14. During the latter part of the month the grade of ore fell off.

A NEW VARIETY of silver ore has been bronght from Bolivia, and it has received the distinctive name of canfieldite, says the *Australian Mining Standard*. It is chiefly remarkable for containing abont 6½ per cent of the extremely rare element germaninm, which was discovered by Professor Winkler in 1886, in argyrodite, a donble snlphide of the new element and silver fonnd at Freiberg. Germaninm has hitherto only been discovered in one other mineral; namely, enxemite. It received considerable attention from the fact of its corresponding almost exactly with the missing element ekasilicon, predicted by Mendelejeff, and it has since taken its place in tbe fourth, or tetravalent gronp of the periodic classification, coming in between silicon and tin vertically, and gallinm and arsenic horizontally. Germanium was snspected in the new metal, from the deposition on heating in closed and open tubes, or of charcoal, of a white sublimate of sulphide, as in the case of argyrodite. In fact, the two minerals, in all probability, are merely dimorphous forms of silver germaninm sulphide.

THE Cleveland Consolidated Mining Company held an election of officers in Red Blnff last week and elected the following officers: Pres., R. G. Hart Jr.; Vice-Pres., Jndge J. F. Ellison; Sec'y, Gen. N. P. Chipman. Directors—J. S. Cone, W. M. Hart, R. G. Hart Jr., N. P. Chipman and J. F. Ellison. By the 1st of December the company will have their five-ton chlorinating and roasting plant in operation, says the Sbasta *Democrat*. The furnace is 40 feet long and has four hearths. The brick for the fnrnace was bnrned on the gronnd.

JAMES ("JIM") WARNER, who recently left Fairhaven, Wash., for Sonth Africa, writes back that the fare is as follows: First class—New York to London, via Liverpool, $65; London to Cape Town, raised $200; Cape Town to Johannesbnrg, railroad, $58; total, $323. Second class—New York to London, winter rates, $35; London to Cape Town, raised, $130; Cape Town to Johannesbnrg, $40; total, $205. Third class—New York to London, steerage, $20; London to Cape Town, third class, $82; Cape Town to Johanneshnrg, tbird class, $21; total, $123.

Tin Mining.

The following curious statements about tin-mining are taken from *Symon's Gazeteer* of Cornwall:

The greatest profit derived in one year was from Penstruthal in 1827—£60,000. The greatest loss on any working was at Wheal Vor—£250,000. The greatest patience ever exercised was by the shareholders in Wheal Agar, working 40 years and no profit. The quickest returns ever made was at Par Consols, where the shareholders (except Mr. Treffry) never paid a penny for costs. The greatest quantity of machinery on any mine in the county was at the Clifford Amalgamated. The mine which worked the longest without intermission was Ding Dong, probably 200 years. The oldest and largest open tin work is that of Carclaze, more than 400 years old. Mulberry, in Lanivet, is nearly as large. The family most enriched by mines was that of Mr. Williams of Scorrier. The first man engine erected in Cornwall was at Tresavean, about the year 1835. The first pnmping engine was erected at Wheal Vor in 1747, and the first stamping engine in the same mine in 1815. Sixty years ago there was no such person as a mine broker; now there are hundreds. Then promotion money for mines was unknown. All mining at that time was of a legitimate kind. The most snperficial discovery of metallic mineral was at Perran Wheal Virgin, near Truro, where a lead lode two feet wide was found immediately beneath the turf covering. At Godolphin a rich copper lode was discovered by streamers for tin in cutting a lead. Here are some comparisons: In 1880 the 60 Cornish and Devonshire mines then working produced 13,370 tons of block tin worth £678,706. In 1856 the production in Devon and Cornwall was 9350 tons of tin valued at £663,350; in 1871, 16,272 tons, valued at £1,630,834, from 145 mines; and in 1872, 14,226 tons, valued at £1,246,135, from 162 mines. In 1874 the 230 mines produced 14,039 tons of tin, valued at £788,310. To the above we may add that, while in 1880 there were 60 Cornish mines at work, there are now only 30 in operation.

An Estimate on Mesabi Mining.

It is a somewhat difficult matter at this time to correctly estimate the cost of mining by steam shovels, but one has only to witness the operation of loading ore to become convinced that the cost must be very small. The surface at the Missabe mountain averages abont 20 feet. The ore is known to be 100 feet deep. Its costs from 25 to 40 cents per yard to remove stripping. It costs from 3 to 5 cents per ton to shovel the ore after the stripping is removed.

Supt. Florada was asked by a representative of the *Mesabi Range* if he could give an estimate of the cost of producing the ore at the Missabe mountain. He replied that it was too early in the game to make an accurate estimate, "but," said he, "so far the cost is nearer 60 cents than 40." Other well-posted men believe that it is much less than his lower figure. One of them took out his pencil and figured the cost of producing a ton of Missabe mountain ore on Cleveland as follows:

Mioiog	$ 30
Rail haul	80
Lake haul	1 00
Royalty	50
Iosuraoce, commissioo, taxes, etc.	15
Total	$2 75

CONGRESSMAN CAMINETTI objects to a statement in the Sacramento *Bee*, accredited to him, that the act now in force "will really do the valley people more good than it will do the mountaineers." "What I said," he writes, "was that the results of the measnre, so far as river protection and improvements were concerned, would be of vast benefit to the valley, more so in that respect than to the mountains." The statement that it was framed as near as possible to protect the interests of both communities is the one he claims to represent his position.

View of the Midwinter Fair.

Visitors to the site of the Midwinter Fair return with favorable impressions of the extent and style of the improvements which are being hurried forward in preparation for the opening on the first of January next. The engraving on this page, which we reproduce from the *Illustrated Pacific States* of this city, gives an excellent idea of the extent and variety of the structures designed for the different features of this great undertaking for public instruction and entertainment. Of the large buildings around the central court all are now sufficiently advanced to show their style and finish—in fact, several of them are almost completed. Of the scorea of smaller buildings, many are well under way and advancing rapidly. The weather has been unexceptional for the prosecution of the work. We believe work has not been interrupted for a single day by unfavorable weather. This in itself ia a testimonial to the climate of which the fair is designed to he an exponent.

When the dedication ceremonies take place on New Year's Day, there will be 75 separate buildings on the fair grounds. In placing the number at 75 the 50 or more kiosks are not counted. Neither are the tents and huts in many of the villages. Only those structures which may be justly designated main structures are taken into account. Of the largest of these the dimensions may be given as follows: Manufactures building, 462 feet long by 237 feet wide, with an annex. It is surmounted by a dome over 100 feet high. From side wall to side wall the arch will be 158 feet wide. It is the largest single spanning arch ever made for a building on the coast. The Mechanic Arts building is 340 feet long and 160 feet wide. The Horticultnral building is 400 feet long by 200 wide. The Fine Arts building 140 feet long by 132 wide. The Administration bnilding is 70 feet square with a tower 100 feet high. All these structures will be arranged around the central court, shown in the engraving, which will be a beautiful stretch of lawn and handsome plants, amidst which fountains will play, and over all at night the electric lights will flash from the tall tower shown in the picture. It is evident that the fair will be large, unique and characteristic of all that Californians enjoy and are proud of, and richly endowed with striking contributions from the uttermost parts of the earth.

BIRD'S-EYE VIEW OF EXPOSITION AND GROUNDS.

The Raber Amalgamator.

It is stated in the Idaho press that the float-gold-saving amalgamator, invented and patented by N. L. Raber of Corvallis, Or., is about to he given a thorough trial on the Snake river. The exact nature of this appliance is not fnlly known, bnt, as already described in this paper (June 17, 1893) it has a series of plated steps, across each one of which is a removable mercury trough, and the sand, etc., falls or drops directly from each step into the quicksilver. Above each of these transverse mercury troughs is a feed machine which automatically feeds small quantities of some chemical substance which keeps the quicksilver clean and lively. Mr. Taylor thinks these machines will lose no gold at all. No power is required for them, though each machine requires six miners' inches of water. The device is said to have recently heen greatly improved.

The machine is designed primarily for the treatment of heach and river sands. The magnetic iron ore is first removed by a Ball-Norton magnetic separator. Mr. Raber claims that he will demonstrate that the gold flour along the banks of the river can be saved at a cost that will pay to work it even if there is only 50 cents to the ton. According to Mr. Raber the average yield of gold to the ton of gravel is about one dollar, and at that rate one of his machines will net the operator $100 per day. Mr. Raber has heen at work on his machine for 13 years and is said to have spent $40,000 in its perfection. He says that all the efforts heretofore made were on a mistaken idea about rusty gold. The Snake river gold, he says, is not rusty. Gold does not oxidize except by mechanical application. He says that his process will instantaneously amalgamate anything from gold so fine as to be imperceptible to a miner's greased pick.

The device is also applicable to works in quartz mills. It has been in operation at the Mammoth gold mines, Pinal county, Arizona. Mr. G. H. Barnhart, agent of the company, writes to the PRESS that the experiments made have yielded very satisfactory results, and that the company has under advisement the adoption of the "amalgamator" in the large mill about to be erected. It has been tried at no other quartz mill anywhere.

The Raber invention altogether has attracted widespread attention among mining men, and announcement of results will he awaited with interest.

The Volatility of Manganese.

At a recent meetlng of the Academy of Science in France, M. S. Jordan presented a note giving some experlments recently made hy MM. Lorenz and Hoesler, whlch confirm the statement recently made by him that manganese could have heen volatilized at the temperatures ohtalned in metallurgical furnaces. The experlments mentioned were undertaken to ascertaln whether manganese would combine with carbonic oxide and were made with a gas furnace designed by them.

The results proved—

1. That in a current of carhonic acid passed through a porcelain tuhe over metallic manganese heated to a white heat part of the gas was reduced hy the metal, while at the same tlme a part of the metal itself was volitllized.

2. When the current was of carbonic oxide there was still volatilization of part of the metal, while the flame proceeding from the end of the tube shnwed ln a spectroscope indications of the presence of manganese.

3. In a current of dry hydrogen identically the same phenomena were ohserved.

4. In a current of nitrogen, the phenomena of volatllization were repeated, hut the manganese dld not combine with the nitrogen as chromium does. From these experiments MM. Lorenz and Hoesler concluded that carhonic oxide dnes not act upon the manganese, hut that it ls volatllized from the metallic form at a temperature a little ahove its fusing point.

On the Artificial Production of Petroleum.

By Dr. C. Engler, in *Gaslight Journal*.

Scientists have discussed very often in the last few years the question in whicb way petroleum, tbis source of wealth, with its special scientific interest for tbis country, was formed by nature. According to one theory it is generated from lnorganic materials. Sokoloff thinks tbat petroleum was produced durlng the period of the formation of our plaoet out of cosmical hydrocarbons, which in the beginning dissolved in tbe soft mass, separated from it later on. Mondelejeff assumes that water entering by fissures and chasms the interior of tbe earth came in contact wltb melting carbide of iron and produced so in a simple manner oxide of lron and the bydrocarbons of petroleum. Strong objection cannot be made to these two theories from the chemical standpoint; but the compositlon of the different kinds of petroleum ls against them, and geology conslders them not free from objections.

For a series of years the ldea that petroleum was produced from tbe remains of plants by a kind of distillation process was generally adopted, especially by cbemists. Chemical and geological reasons are against tbe theory. From the chemical standpolnt it seems quite lmpossible that the substance of plants could be split up by distillatlon lnto petroleum without leaving charcoal or coke. Tbere would also be a geoetic connection between coal and petroleum; but ln occurrences of the ordinary klnd coal is nearly always absent. If tbls were really the case, then there ought to be with every oil occurrence in close connection a coal bank, whlch really seldom happens.

By a third theory the remalns of animals form the raw materlals from which petroleum is formed by nature. There are many facts provlng the decay of masses of animals which we find now ln banks in the crust of the earth in the form of the remains of shells, fishes, saurians, etc. Prominent scientists, amongst them the Americans Wrigley, Whitney, Hunt and others, and ln Europe, Hofer and Ochsenius especlally, defend this ldea on geological grounds. But I will not enter into the geológical discussion, preferring to try to give an answer to the question: How can the transmutation of animal remains into oil be imagined?

Io order to answer this some thousands of salt water fishes and also shells bave been distilled under strong pressure. Tbe result was a liquid containing mostly nitrogenous bases, such as pyridin, whicb was little or not at all similar to petroleum. I then recalled some experiments of Wetherlll and Gregory, who found tbat the wax found in cadavers, the so-called "Adipocere," was nothing else but the fatty residue which remains after the putrifaction of all animal matter, especially of the nitrogenous constltuents of the cadaver. It ls also well known that even fossil bones frequently contain fat. The question now raised was tbis: Could not the process in nature bave been a similar one; should not first of all the nitrogenated animal substance have been destroyed leaving the fat, wbich was tben transformed into oil. In order to prove chemically tbls possibillty, I submitted anlmal fat (train oil) to distillation—first in a sealed glass tuhe, later on in a large iron vessel—under a pressure of 25 atmospheres at a moderate heat (300–400 C.), and to my great delight fonnd tbat under favorable conditions 70 per cent of the train oil was transformed into petroleum. Tbis equals 90 per cent of tbe tbeoretical output. Besides the oll some water and some combustlble gas also formed. The same bebavior has been shown by otber fats like butter, tbe fat of hogs, artificlal fats, also the chemically pure glycerids of the fats like tri-olein, tri-sterin and the free fatty acids. All could be transformed into petroleum by dlstiliatlon uoder pressure, wben managed ln tbe proper way.

Tbis liquid, whicb you see here, is tbe distillate of the fish oll, and I bave isolated from it almost all the hydrocarbons whlch have been discovered in the petroleum of Pennsylvania. Tbe other products—the oll burning in tbls small lamp, too—are oils contained in the crude materlal by purification.

But not only lllumlnating olls are produced. I separated also by distillation tbose llgbter hydrocarbons which compose the gasoline, the ligroln, the benzine, etc. Recently I have succeeded in finding and separatlng para ffin wax and lubricating oils from those parts of the crude oil wbicb show a bigh boiling point. This removes tbe objection of O. Ross to my theory of the formation of petroleum from animal remalns. As a matter of fact I have found ln the dlstillate obtained by decomposition of traln oil nearly all the constltnents whicb have been separated from the natural crude petroleum, and even the gases, whlch, like natural gas, consist essentially of marsb gas.

Very recently I have made close lnvestigatlons on the mechanism or on the chemism of the formation of the hydrocarbons of tbe petroleum produced by dlstillation of fat under pressure. Tbis paper is published in a recent number of the *Berichte der Deutschen Chemischen Gesellschaft*, 1893, 26, 1436. These experiments prove that the simpler organic acids split up in tbe same way, yielding almost tbe theoretical quantity of the respectlve hydrocarbon. Thus pbenylacetic acid yields toluene. For further details I am obllged to refer to the paper itself. I need only remark tbat we have to assume tbat the acids with high molecular weights are decomposed witb the production of a number of hydrocarbons.

To recapitnlate, it is a geologlcal fact tbat we find in nature the remains of antediluvlan anlmals as shells, fishes, saurians accumulated in masses. Wbether these animals have been piled up in consequence of a natnral super production in special places ln the ocean, or by cnrrents, nr in consequence of great revolutions of tbe earth, this must be decided by geology; but the remains exlst.

Now ln whicb manner do the organic substances of these anlmals become decomposed?

The animal substance consists essentially of nitrogenated material and fat. Tbe fnrmer is easily decomposed, the latter is very stable, a fact wbicb has been very well known for a long time and has been sbown again by exact investlgations. Tberefore we find the wax nf cadavers in nld graves; therefore the fat in tbe bones nf mammals tbousands of years old; therefore the fat on tbe bottom of tbe ocean recently found.

Whether and bow the fat was decomposed in this long period by tbe water splitting up glycerol and forming the free acld, for instance the fat in tbe bones of mammals, cannot be answered. Botb, fat as well as the fatty acids from petroleum, when dlstilled under pressure.

We can imagine tbat such remains, wrapped in mud and transported by the currents in the ocean, easily accnmulate and later on, under the pressure of sedlmentary layers or strata, perhaps under the influence of heat, too, are transformed lnto petroleum. Tbis is only one of tbe many possibilities by wbicb tbe mecbanical process of the transmutation of fat into petroleum may have happened.

Under any circumstances I think I bave proven that from tbe chemlcal standpoint, the formation of petroleum from animal remains has the greatest probabillty, as we are able now to transform every anlmal fat into petroleum.

A New 100-Ton Furnace in Australia.

Tbe new furnace at the Broken Hill Proprietary mlne is described by the *Mining Standard* as a 100-ton furnace. It is water-jacketed throughout. The top half nf the furnace consists of four bollow-wrougbt steel jackets, three being 9 feet 9 incbes deep, and the fourth, wbich carries the flue, is 8 feet deep. The water ls fed in at the bottom of each jacket, and all the jackets are connected together so as to make sure of an equal circnlation of water througb them all. The two side jackets have two lugs, and the two end ones three lugs riveted on the outslde of them, and which rest on an oblong frame of 8-inch I iron, the corners of wbich rest on four bollow cast-iron columns or pillars. The jackets are then fastened together witb a wrought-lron strap passlng around them. Between tbe bottom edge of these jackets and tbe top of the crucible is a space of 5 feet, where tbe cast-iron jackets go. Tbe lower half of the furnace consists of 20 jackets in all, eacb 20 inches wide. There are 6 jackets on each side witb tuyeres, and 4 corner jackets witbout tuyeres, the 16 being cast iron, and there are 4 wrougbt-steel end jackets, eacb with a tuyere opening ln tbem. The tuyere openings are in the middle of the lower balf nf the cast-iron jackets, and not as they are in the other blast furnaces in Broken Hill, between two jackets. Tbe water is fed into eacb jacket, about the middle of its lengtb, and as it is closed at the top it is kept full and under a certain amonnt of pressnre nf water by a goose-neck arrangement for the overflow of the waste water, whlch delivers the water into a copper launder some nine inches above the top of the jacket. Tbis lannder is by tbls arrangement made a fixture, and need not be moved wben it ls necessary to remove a jacket. All the water from top and bottom jackets, tuyeres, breasts and slag spouts dellvers into tbls launder, which emptles into the hollow columns from which pipes carry the water to tbe cooling tanks. Each of the lower jackets has three legs on eacb side of the front face, so that the wbole 20 can be bolted together. To further strengtben them a binder made from steel ralls is also bolted around them just above tbe tuyeres. A pressure of about 30 tons from the charge in the furnace has to be resisted. Usually before a jacket is to be removed and the girder just spoken of taken off tbe furnace, the jackets are propped up to prevent tbem bulging ont with the weight of the charge. These props are always ln the way, and to do away witb tbem a jacket fastener has been lntroduced, whlcb fulfills the same duty. It consists of a carriage which sildes along tbe under side of a girder fixed between the columns sligbtly above the level of the top of the lower jackets, throngh whlch passes a sqnare-headed screw, the point of wbich enters a small hole countersunk in the face of tbe jacket when screwed up tightly, so tbat tbe jacket cannot move in the sligbtest degree. Wben a jacket has to be removed, tbe screw is loosened and the carriage slid along the girder out of the way. The blnder is taken off tbe ontside of the jackets, and tben the jacket is ready to be pulled nut. Tbere are 24 of tbese jacket fasteners, one being used for each jacket, except the corner ones, wbich have two. The cruclble of tbe furnace is similar to other crucibles on the hill. The general deslgn of tbe furnace is similar to the No. 2 furnace now ln blast, whicb is from plans of Mr. Howell. It is expected that this furnace will be an extremely handy one as far as its fittings go, and experience has proved tbe design to be the best in otber ways, although the scarcity of water in this dlstrlct has prevented lt being more generally used.

Wben the three furnaces are in full blast they will have a capacity for treating between 1000 tons and 1100 weekly, so that the output of bullion in tbe future will be considerably augmented.

The New Coolgardie Field.

Tbe new gold field of Coolgardle in western Australla, has recently attracted some attention and has drawn thitber a large influx of mlners from other regions. The *Mining Standard* bas an intervlew with Mr. George Gorrie, one of the promoters of Bayley's Reward, the original location. Says Mr. Gorrie:

"Tbe reef ln Bayley's Reward goes on developing very promisingly. Both nortb and sonth an enormously rich shoot of gold extends witbont any diminution so far. Wben I left Coolgardie one shaft was 55 feet deep on the course of tbe lode, and the gold at the bottom was quite as rich as near tbe snrface. Tbe main shaft is some 200 feet east of tbe lode; it is 10 ft. x 4 ft; well timbered with sawn timber, and in tbis tbey antlcipate that tbey will cut tbe lode at 300 feet. In this shaft also tbey struck water at 94 feet, and the lnflow of water at 154 feet was 400 gallons per hour. They have already taken out about 13,000 ounces of gold from 11 tons of stuff; and they have 1000 tons at grass wbich I feel certain will go 20 ounces to the ton, straight from the stamps. You know Bayley's management refuse to treat anything tbat will not go a penny-weigbt to the pound of quartz. For obvious reasons their machinery is of the simplest description—a four-horse power kerosene engine, which drives a panklast and pan. Already they bave paid 22s 6d per share in dividends.

"I tbink Coolgardie has a big future. I have very little doubt but tbat it will be a permanent reefing field. The lodes are wide and well defined, so far as at present opened up. The stone carrles a considerable amount of iron and some specks of galena, but it is very free indeed of tbe baser metals, and good for amalgamation—that is, toward tbe surface. Below the water level, I believe, it will be found to be a dense iron lode. The stone is not at all patchy, the gold being regularly distributed. In Bayley's tbe lode is seven feet in width. Tbe western lode we have ls between tbree feet and four feet. It is almost impossible at present to say wbat is the area of the gold-bearing country in tbe dlstrlct around Coolgardie. Tbe place bas not yet been thoroughly prospected. Men had to carry water and provlsions, so they could not thoroughly prospect, except within a radius of three or four miles. Alluvial gold bas been found all over the surface, and our western reef traverses No. 6. Four or five miles away there are some good sbows, with indications of permanent lodes."

THE following communicatlon in a London mining paper from "X. X.," under date of October 20th, will be information in California:

SIR:—I see that in some of the financial dallies tbe writers complain of being in the dark as to the position of the Golden Gate and Golden Feather companies. Perhaps you will enlighten them by publishing this letter:

Col. McLaughlin has attacked the qnartz lode in Golden Gate, witb the following result: He has driven an adit of upward of 500 feet on the course of tbe lode, proved it to surface, 120 feet or tbereabouts, and in depth some 40 or 50 feet.

Tbe whole of this is in ore worth about $22 (upward of 1 oz. to tbe ton), and now he has struck into ore ranging, by last accounts, up to 6½ ozs. per ton.

The amonnt of ore practically proved is about 7000 tons, worth from 20,000*l.* to 25,000*l.* The lode shows a splendid ontcrop for at least three-quarters of a mlle in the company's ground. Witb 20 head of stamps a net revenue of 25,000*l.* per annum should be easlly obtained. Golden Feathers are suffering from reiterated attacks of interested parties, who point out tbat the month of November is at hand.

That month, with all due deference to these gentlemen, ls usually the most beautiful montb ln the Californian year.

In six weeks, witb 240 men, working in shifts, and inefficient appliances, the "old people" got out 140,000*l.* sterling.

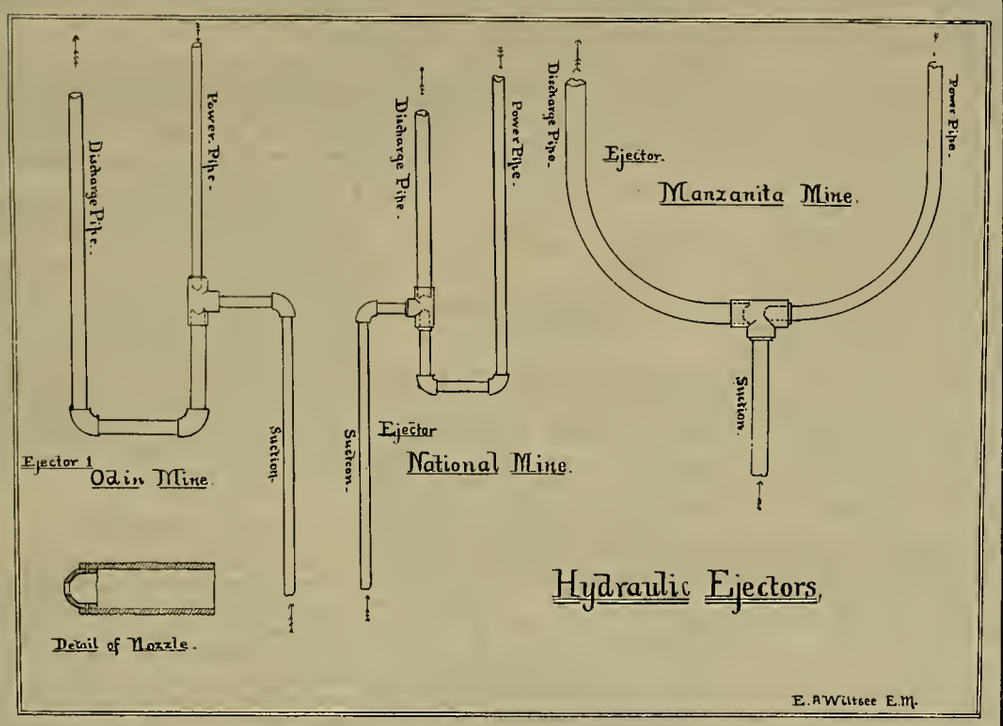
Tbe present water-power in use represents about 1100-horse power, so tbat the posslbllities of tbe next six weeks are of no small signlficance.

Hydraulic Ejectors.

By E. A. Wiltsee, E. M., in the Eleventh Report of the State Mineralogist.

This ingenious device for the elevation of small quantities of water without the aid of pumping machinery has found quite a widespread application among the drift gravel mines of Nevada City, Nevada county, where the quantity of water is small and water power under high head easily procurable. The contrivance depends upon the principle of induced currents for the raising of the water into the pressure stream immediately in front of the nozzle; once there, it is elevated to the surface simply by the force and velocity of the larger stream of power water, which makes the ascent of the discharge pipe under the influence of its heavy head.

The arrangement of the machine, if such it can be termed, is quite simple, and is shown in the accompanying sketch. The component parts are: The pressure pipe from surface, down which the power stream is conveyed; an ordinary "tee," into which the power water discharges through an internal nozzle, to be received in an internal receiving nozzle of slightly larger diameter an inch or two away. Into the branch arm of the "tee" the suction pipe from the sump is fitted, so as to deliver the water, induced by the vapor formed, into the pressure stream between the "tee" nozzles; and lastly, the discharge pipe to surface, a little larger in diameter than the power pipe conducting the pressure stream down.



The construction of the nozzles is very simple. The fitting entering the "tee" is a nipple, to which the pressure pipe is attached externally by a coupling. On the inside of the nipple is riveted a blunt nozzle with the necessary aperture, as shown in sketch. The receiving nozzle is of the same description, but a little larger in diameter and riveted into the end of the nipple entering the other end of the "tee," and to which the discharge pipe is coupled. The nozzles are thus adjustable within a certain distance by means of the nipples, and in small machines this has been found ample. The construction of the nozzle is shown in the sketch. The size of the nozzles used on these small arrangements is usually three-eighths of an inch in diameter for the pressure nozzle, and five-eighths of an inch for the receiving nozzle. This proportion does not appear to be absolute, the requirements of the contrivance being that the receiving nozzle shall be large enough to receive the pressure stream and the added water to be elevated, and near enough to the pressure nozzle to collect and receive the stream before it breaks and scatters. A valve should always be placed in the power pipe near the "tee," in order to turn off the power water in case of any accident to any part of the apparatus. It would also be advisable to have a large valve in the discharge pipe near the device, if the discharge were of any considerable size and contained any large quantity of water.

Three arrangements of the device are shown in the sketch, not because all are deemed advisable, but as representing the three types found in actual use.

No. 1.—That used in the Odin mine; is the worst of the three, and is considered by the writer an example of "what not to do." In this arrangement the power stream, after entering the receiving nozzle and having the additional stream to be elevated, is forced around two right-angle turns, and necessarily loses a large proportion of its velocity, power and working force.

No. 2.—In use at the National mine, and the original device of the inventor, or designer, is to the mind of the writer by far the best mechanical device. The full power stream is led around the turns before its discharge from the nozzle, and the discharge, when it does take place through the reduced nozzle, is straight up in the direction in which its work is, with no impediment or obstacle in its path except the natural friction of the straight pipe.

No. 3.—The arrangement in use at the Manzanita mine; while not so bad as No. 1, would seem to impare the force of the working stream to some extent by reason of the heavy friction entailed by leading the stream around the bend preparatory to its upward flight. As the design has been used but a short time, though with great success in every case, it was impossible to get any exact figure as to the amount of work done, or percentage of power realized from the working stream. As nearly as the operators of the device could state, about one-quarter to one-third of the number of inches of water employed in the power stream were raised from the water of the mine. In other words, a power stream of four miner's inches would elevate with it one and one-half miner's inches from the mine. It is to be hoped that the users of this arrangement will carefully measure both streams and ascertain the exact amount.

The power water was employed under various heads, varying from 600 feet in the Odin mine to 200 feet in the National mine. The water was elevated 180 feet in the Odin mine, 210 feet in the Yosemite mine, and 100 feet in the National mine. As the power water is delivered at the bottom of the shaft or workings, the working head will always be increased by the vertical distance from the surface, in addition to the head of power water at that point.

The nozzles are placed, in these small arrangements, at a distance of from one to two inches apart. The adjustment is made by trial after the device has been put together. The designer of this form of hydraulic ejectors is Mr. Rounder, of the National mine, and to him is due the credit of the application of the principles involved.

The application of the device, while somewhat limited, is of considerable importance. By its use all heavy expense for pump columns and attendant machinery is saved—no small item in prospecting operations. While it has not as yet been tried here on a large scale, to the knowledge of the writer, it is certain the operation would be successful, the only question being as to whether its operation would be economical, on account of the small percentage of the power realized. Where water power is free this item would not enter into consideration; but when the quantity to be raised is small, and the distance to be elevated not too great, and when water power can be obtained under a heavy head at reasonable rates, the application of the device would seem to be economical and desirable in every way; and it has been applied frequently, under conditions of the above nature, in and around Nevada City. It requires practically no watching, has no wearing parts, and never wears out.

Where to Dig for Gold and How.

An old California miner, Mr. W. P. Buckhurst, writes to the Australian press as follows: "If I had a friend going to start farming, my advice to him would be, shun all poor, hungry land as you would a pestilence. Get into a district noted for good land, and you may succeed. Well, it is just the same in mining. If a party is forming to go prospecting, the first best thing to do is to secure the best mining maps of the colony, and then trace on them the auriferous belts on which the richest diggings have proved to exist, and shun those that have never proved more than 'tucker diggings.' They are like poor land—will always keep a man poor. Shun South Africa and be chary of West Australia. Having decided on the field you intend to try, get well within the limits of the proved auriferous belts, for gold-bearing country generally runs in belts for miles east and west or north and south, as the case may be, and then prospect in the gullies or creeks untried or deserted between, but in the line of old paying diggings. A capital plan, which we used to adopt in California, where we did not look for the Government to do anything for us (as I fear is too much the case here), was to form a party of six with confidence in each other and divide up into three parties of two each. One couple would go to work washing over again old 'tailings' of some rich gully, or tunneling claims, or working little paddocks that had been left untouched between the workings of some deserted diggings to make tucker for the six. The other two couples would go prospecting in different directions in the likely or promising looking gullies in the neighborhood, and if either of the parties struck any promising ground all would unite and work it, always bearing this in mind, viz., that quartz is the matrix of gold, and when any good alluvial gold is discovered in a gully or creek there is pretty sure to be a pay ledge somewhere above, and that is the place to look for them, although the formation of the gold-bearing country here is different from California. Here there is more deep sinking for alluvial gold.

"Never leave half-ounce diggings to go prospecting. There is one other point that may or may not hold good here as it did in California, but which prospectors would do well to carefully observe and take a note of—one of the things our California geologists poohpoohed and ridiculed, viz., that on the rich gold-bearing flats up on the side of a mountain, in the gold belt, the same class of vegetation or a certain kind of tree predominated, though the diggings were sometimes seven miles apart. 'What has a tree on the surface to do with the gold 30 or 50 feet below?' says the geologist. It's puzzling, like many other things in gold mining, but there was the fact, which many old miners noted. A certain class of strata, thrown up in the upheavals ages ago, may have favored the growth of a certain class of tree."

The Transvaal Boom.

A Transvaal correspondent to a Montana paper calls attention to several features of life in South Africa that are worth repeating. "A very noticeable feature of this new country," he says, "is that nobody carries a 'gun' and there is no toughness such as characterizes mining camps in other lands. For upward of six years hundreds of thousands of ounces of gold have gone annually from this place by stage and the coach has never been held up or a pennyweight of gold lost in transit. A box containing over 100 pounds avoirdupois of gold was dropped off the coach on one occasion and it was picked up and brought on by another team.

"There are about 300,000 souls, black and white, in the republic, and its President receives $40,000 per annum, house rent and $1500 a year for 'coffee money.'

"There are plenty of crocodiles in the river. We see them often and ran onto a snake a few days ago that would raise the hat off a man's head. We estimated his length at twenty-five feet and diameter at eight inches; and we have not taken a drink for two months, either, so the snake was real."

Twenty-five hundred stamps are now dropping night and day. One man is said to make $1.50 ore pay. Native laborers are said to get $7.50 per month and it costs $5 more to feed them.

The country is declared to be "on the eve of a colossal boom." It is a peculiarity of booms that they are always "coming." They are based on anticipation. Realization, or failure to realize, generally ends them. It is a fact that the Transvaal has for some time been experiencing a genuine boom, and it is probably true that matters soon will be, if they are not now, down to a bread-and-butter basis. It is likely that the gold output will be increased, but not in the degree expected. It is too much to say that the Transvaal boom is over, but the chances are favorable that it is near its height, while the people of Transvaal think it has not begun.

Scientific Progress.

Barnard on Astronomy.

Prof. E. E. Barnard, of the Lick Observatory, recently gave a lecture on astronomy in this city. Many stereopticon illustrations were shown. Professor Barnard said that photography had enabled the astronomers of to-day to see plainly that of which their brethren of a few years ago had never dreamed. Even the trained eye of the most eminent astronomer begins to grow tired after looking through a telescope a minute, and after that his vision becomes less acute. Any object that he fails to notice in that short time passes by unseen. The plate in a camera, however, may be left exposed for hours, during which time even the faintest star will have left at least some slight trace.

About 60 stereopticon views were presented, showing some of the most interesting of the heavenly bodies under varying conditions. In a photograph of the moon's surface could be seen the dark areas called seas, and the vast lunar craters.

A picture of the sun's disc revealed a sun spot said to be three times as large as the earth. Ragged-looking holes that looked as if they had been made by a tremendous explosion, were plainly visible, and were said to be shattered places in the sun's atmosphere.

Two drawings of the planet Mars were particularly interesting. It will be remembered that this brilliant neighbor of ours is about 35,000,000 miles distant from the earth, and therefore the difficulty of obtaining an accurate representation of it may be imagined. The planet as a whole is of an ochre cast, but the trained eye of the astronomer detects little green spots, believed to be water, and others supposed to be land. At the poles are white spots, evidently ice and snow. This white region diminishes in density as it approaches the equator, and finally disappears altogether. Professor Barnard said that these spots increase in extent as the planet moves away from the sun and the temperature presumably grows colder, thus tending to substantiate the theory that the poles of Mars are surrounded by ice and snow, as are those of the earth.

The streak across the sky commonly known as the milky way becomes a thing of beauty when reproduced on canvas by means of a camera. The clouds of countless stars, each one a great sun in itself, assume an added brilliancy that one would hardly suppose exists when looking at them with the naked eye. It requires four hours for this collection of heavenly sparklers to make an impression on the supersensitive plate of a camera, and during all this time the camera is moved by clockwork to keep pace with the stars as they seem to be winging their tireless way through space. The great comet of 1882, which startled all the world with its long tail, was reproduced with startling effect. This comet has a tail 100,000,000 miles long, and will not be again visible to the inhabitants of the earth until 800 years have passed away.

Powerful French Telescope.

A great refractor is just finished and placed in position for Dr. Janssen at Meudon. It is a combined photographic and visual telescope. The two lenses were made by the celebrated Henry Brothers, of the Paris Observatory. The mounting is by Gauthier, of Paris. Both lenses will be mounted in the same tube, which is *square* and of steel. The visual objective is 82 cm. (32·3 English inches) in diameter, while the photographic objective is 63 cm. (24·8 English inches) diameter. Both lenses are of the same focal length, 17 meters (669 English inches). The large objective will be the guiding part of the instrument when used for photography. This great telescope is housed in the ruins of the royal palace, a part of the ruins serving as the tower for the great dome, which dome is 20 meters (66 English feet) in diameter and weighs some 60 or 80 tons. The dome is to be moved by a gas engine of 12-horse power. The observing chair is attached to the dome and moves with it. All the fine circles are to be read from the eye end by means of electric lights, the electricity for which is to be generated by an eight-horse-power engine half a mile distant, in what was formerly the royal stables.

Movement of Diamond Molecules.

Sir R. Ball, who is fond of revealing the marvelous, has been studying the mysterious action of molecules; and what he has to say concerning the movements of the molecules of a diamond is as truly surprising as anything he has told us about the sun and the planets. Every body is composed of a multitude of extremely, but not infinitely, small molecules, and it might be thought, says Sir Robert (according to a contributor in the Newcastle, Eng., *Chronicle*), that in a solid, at all events, the little particles must be clustered together in a compact mass. But the truth is far more wonderful. Were the sensibility of our eyes increased so as to make them a few million times more powerful, it would be seen that the diamond atoms, which form the perfect gem when aggregated in sufficient myriads, are each in a condition of rapid movement of the most complex description. Each molecule would be seen swinging to and fro with the utmost violence among the neighboring molecules and quivering from the shocks it receives from the vehement encounters with other molecules, which occur millions of times in each second. The hardness and impenetrability so characteristic would at first sight seem to refute the supposition that it is no more than a cluster of rapidly moving particles; but the well-known impenetrability of the gem arises from the fact that, when attempt is made to press a steel point into the stone, it falls because the rapidly moving molecules of the stone batter the metal with such extraordinary vehemence that they refuse to allow it to penetrate or even to mark the crystallized surface. When glass is cut with a diamond, the edge which seems so hard is really composed of rapidly moving atoms. The glass which is cut is also merely a mass of moving molecules, and what seems to happen is that, as the diamond is pressed forward, its several particles, by their superior vigor, drive the little particles of glass out of the way.

Meteors.

The following historic account of meteors is given in a local paper: A meteoric stone, which is described by Pliny as being as large as a wagon, fell near Ægospotami, in Asia Minor, in 467 B. C. About A. D. 1500 a stone weighing 1400 pounds fell in Mexico and is now in the Smithsonian Institution at Washington. The largest meteoric masses on record were heard of first by Captain Ross, the Arctic explorer, through some Esquimaux. These lay on the west coast of Greenland, and were subsequently found by the Swedish exploring party of 1870. One of them, now in the Royal Museum of Stockholm, weighs over 50,000 pounds, and it is the largest specimen known. Two remarkable meteorites have fallen in Iowa within the past twenty years. February 12, 1875, an exceedingly brilliant meteor, in the form of an elongated horseshoe, was seen throughout a region of at least 400 miles in length and 250 in breadth, lying in Missouri and Iowa. It is described as "without a tail, but having a flowing jacket of flame. Detonations were heard so violent as to shake the earth and to jar the windows like the shock of an earthquake," as it fell about 10:30 P. M., a few miles east of Marengo, Iowa. The ground for the space of some seven miles in length by two to four miles in breadth was strewn with fragments of this meteor, varying in weight from a few ounces to seventy-four pounds. On May 10, 1879, a large and extraordinarily luminous meteor exploded with terrific noise, followed at slight intervals with less violent detonations, and struck the earth in the edge of a ravine near Estherville, Emmet county, Iowa, penetrating to a depth of fourteen feet. Within two miles other fragments were found, one of which weighed 170 pounds and another 32 pounds. The principal mass weighed 431 pounds. All the discovered parts aggregated about 640 pounds. The one of 170 pounds is now in the cabinet of the State University of Minnesota. The composition of this aerolite is peculiar in many respects; but, as in nearly all aerolites, there is a considerable proportion of iron and nickel. It is generally held that meteors at one time or another formed integral parts of a comet. The meteor enters the earth's atmosphere from without with a velocity relative to the earth that is comparable with the earth's velocity in its orbit, which is nineteen miles per second. By the resistance it meets in penetrating the air, the light and the other phonomena of the luminous train are produced. Many small meteorites are undoubtedly consumed by this fire, caused by friction, before they reach the earth's surface.

Mechanical Progress.

Canal Cutting and Dredging on the Sacramento.

The progress of work by the new canal-digging machine on Grand island, and of the dredger for strengthening the levees, are thus described by the *Record-Union:* The machine built to cut the drainage canal inside the island is a one-yard Marion Steam Shovel Company's ditch dredger. The machinery was placed upon a hull 22 feet by 70 and cuts a canal 23 feet wide. This machine was started to work September 18th, and excavated during the remainder of that month 16,100 yards, requiring, of course, some few days for the thorough adjustment of the parts. During the month of November it excavated 62,770 yards, or 2414 yards for each working day in the month, or 115 yards for each working hour.

The material was deposited on both sides of the cut, and the month's work was a uniform canal 12,413 feet long for two and one-third miles, 23 feet wide, and a little over an average of 6 feet deep. The only delays were occasioned by fog on the morning watch, which on six or seven mornings occasioned a delay of three or four hours.

This machine is in charge of Allen Adams and is giving the land-owners first-rate satisfaction.

The dredger "Grand Island," built for the river levees, is a clam-shell, with a hull 40x80 feet, and with a boom 105 feet long. This machine is handling a bucket weighing 8000 pounds, with wire ropes in place of chains. It was started to work on the 30th of October, and for 22 hours per day is delivering, as nearly as may be, one bucket per minute, averaging in the material it is working in (fine river sand) two cubic yards to the bucket. This material, from the point of excavation to the point of delivery, is being moved 150 feet.

This dredger is building a roadway outside of the present levee, 16 feet wide, and at the same time furnishing material to put a two-foot crown on the levee. It has already made one mile of this work, and it is expected to progress at the rate of about a mile in 11 days. It is in charge of J. Hyde, and with a few more days' breaking-in of the machine and crew, will be a very efficient machine.

The machinery is all completed by Byron Jackson for the additional pumping plant to be installed at Ryde, and this plant will have a capacity of 30,000 gallons per minute, with compound engines of the newest type, and will, it is believed, with the large plant already in, give complete control of the rain and sipage waters.

The Zalinski Dynamite Gun.

New dynamite guns, the invention of Captain Edward L. Zalinski, stationed at the Presidio, San Francisco, are in use on the El Cid, of the Brazilian navy. The guns are pneumatic, and are most extraordinary pieces of ordnance to look at. They are more like a gigantic smooth-bore fowling piece than anything else, bearing a strong resemblance to the tall, narrow smokestacks in use on Mississippi-river steamboats thirty and more years ago. They are made of steel or aluminum bronze, and about half an inch thick and about thirty feet in length, but they can throw dynamite, gun-cotton, explosive gelatine, or, in fact, anything that will blow up. They are more quickly and easily handled than the ordinary powder gun.

They are able to scatter lumps of dynamite, gelatine or gun-cotton weighing a quarter of a ton, and do it accurately, too. They make no deafening report or cloud of smoke, but simply belch out torpedoes as a Roman candle does lights.

They throw a quarter of a ton of explosive gelatine a distance of a mile, and smaller masses three times as far.

Captain Zalinski has been working on this gun for the last six years. When he left the Presidio several months ago for the East, it was generally understood among his brother officers that he was going to superintend the construction and mounting of some of his pets, and since the Brazilian outbreak that he might be employed to instruct the Brazilians or their representatives in the use of the destroyers.

Coal Oil in Steam Boilers.

Evidence that a little petroleum used inside of steam boilers will prevent the formation of scales increases. An American publication, the *Safety Valve*, has printed a letter from a manufacturer who has tried this agent for over six years in a plain tubular boiler, serving a 50 or 60-horse power engine. Every fortnight the fires are drawn and the boiler washed. On refilling, about two quarts of oil are put into the water, and two or three quarts more are added, one at a time, during the next two weeks, in this manner. Just below the injector suction pipe is a well containing a quart. This is filled with oil when desired. The well and pipe are connected with a "T" and two cocks, and the water is thus drawn in over and with the oil, transferring the quart in two or three hours. A Providence firm, using a 125-horse power boiler, has a special device, called an oil injector, and consumes about the same amount as in the other case. Ordinary kerosene, of the cheapest quality, is said to be preferable. In the Providence experiments, the boiler was examined after 10, 14 and 28-day runs, and every time the tubes and sheets were as clean as when new. The manufacturer first referred to here says: "Since we have used the oil we have not found it necessary to use any mechanical means to keep the tubes and tube heads in order. Of course the oil does not prevent the precipitation of the lime that is in the water, but it is in the form of loose scales and does not adhere to the iron."

A New Pumping Jack.

A new pumping jack, the invention of Mr. Ezra Taylor, of Ojai, Cal., is thus described in a local paper: The pumping jack, in short, is a multiplication of applied power in pumping water, and, it would seem, will go far toward solving the water supply in a given well or locality. The jacks are sub-

stantial and well finished, and have every appearance of lasting a lifetime. The capacity of an arm which is attached to a pump in the pipe can be adjusted from a 6-inch to a 14-inch stroke, the latter of which, in a 3-inch pipe, will raise 18 gallons of water per minute. A well that can resist the jack working at its full capacity, and still "hold its own," is almost limitless. The jacks are supplied with shafts for either horse-power or engine attachments.

An Indiana Man's Wonderful Clock.

R. H. Sites of Portland, Indiana, will show a wonderful clock at the approaching Midwinter Fair. It is 13 feet high and 9 feet wide. The main dial is two feet in diameter, and it gives both sun and standard time, also the day of the month. On its face is a number of smaller dials, one giving the day of the week. Another shows the origin of the days, by the planets appearing as they were named in the second century, when the mode of reckoning time by weeks was adopted. On Saturday, Saturn appears; on Sunday, the sun; on Monday, the moon, and so on. Another dial points out important past events, fixed days that are most observed by the churches and the so-called unlucky days in each month as the ancients respected them.

Still other small dials show the time of the rising and the setting of the sun, the four cardinal points, the moon's phases, increasing and decreasing, and the moon's age in days and quarters. An ocean scene, with indicator attached, gives the ocean tides so that their proportional height can be seen at any time. The large dial exhibits a table of mortality, showing the proportion of deaths, based on a calculation of 10,000 persons. Still another dial is that from which the clock takes its name, the 100-year astronomical clock, which points out the ruling planets from 1876 to 1975, the long pointer from the center of the dial indicating the day of the month.

The solar system is represented by the earth, sun and moon, the center being a fixed sun, the larger ball the earth, and the smaller ball by its side the moon. The earth revolves around the sun, keeping pace with the solar time dial on the large dial, previously described, and the moon revolves around the earth in unison with the moon dial, showing the months of the year—winter, spring, summer and autumn.

On top of the clock is a figure representing Sir Isaac Newton taking views through his large telescope, which changes position on the quarter of the hour; the figure turns about and revolves one-fourth of a circle looking east, west, north and south. On either hand are the battlemented towers of an ancient castle. To the right of the dial are three sets of moving figures; the first is General Washington reviewing his army; the second the Presidents of the United States in the order in which they were elected; and the third the ancient mode of capital punishment is shown by the death of Mary Stuart by the ax.

On the left are also three sets of figures. The first, or uppermost, shows the flight of time with the four seasons. In the second the heroes of '76 are honored by a bow and wave of the hand from the Goddess of Liberty, all except Benedict Arnold, who is allowed to pass unnoticed. The lower one is a tableau picturing the fondness of the elephant for children. There are two other sets of figures, above and below the main dial, which are scriptural in character. In the one above an upright figure keeps time to the music with his hand, and another, kneeling by his side, strikes the hour with a hammer.

This clock has 100 moving figures and characters, making a change of scene every three minutes, and its music-boxes play 18 tunes, including the old-time "doxology," or "Old Hundred," and a sweet chime of bells, giving music every five minutes.

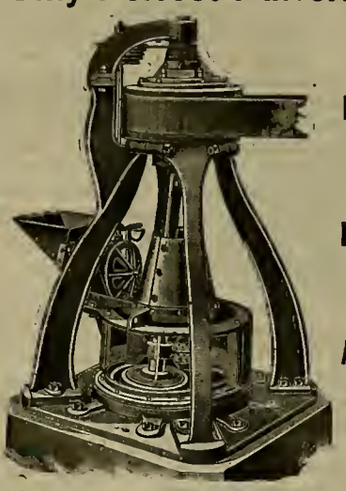
THE GRIFFIN MILL
The Only Perfect Pulverizer

OF QUARTZ, GOLD OR SILVER ORES, PLUMBAGO, PORTLAND CEMENT,



OF PHOSPHATE ROCK, FOUNDRY FACINGS, And All Other Refractory Substances.

Will work either wet or dry, and deliver a finished product. Capacity, 3 to 4 tons per hour on Phosphate Rock, 1½ to 2 tons per hour on Portland Cement, Quartz or Ores, depending on hardness of material to be pulverized and fineness of product. Grinds from 30 to 250 Mesh with equal facility.

NO JOURNALS IN GRINDING CHAMBER. BALL RIGID ON SHAFT HAVING DIRECT POSITIVE ACTION ON MATERIAL. MINIMUM POWER PRODUCES MAXIMUM AMOUNT OF PRODUCT. IT IS ABSOLUTELY GUARANTEED IN EVERY RESPECT, BOTH AS TO CONSTRUCTION AND CAPACITY. FIRST COST, WEAR, AND OPERATING EXPENSE MUCH LESS THAN STAMP MILLS. LARGE NUMBER OF MILLS IN USE ON DIFFERENT MATERIALS WITH POSITIVE SUCCESS IN EVERY INSTANCE.

Correspondence solicited, and illustrated descriptive pamphlet furnished on application to
BRADLEY FERTILIZER CO., 92 State St., Boston, Mass.

PRACTICAL TREATISE ON HYDRAULIC MINING.
By AUG. J. BOWIE, Jr.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

Electricity.

The Hydrograph.

The remarkable property possessed hy water for condncting sound is well known, but we are not aware that any successful attempt has hitherto been made to turn that property to account for signaling purposes. Its utiilzation in that direction, however, seems to have been effected in a practical manner by Captain Neaie, who has devised a system by means of which slgnais can be given, messages exchanged and conversation held between ships on the sea or on rivers, whether moving or stationary, or between ships or lighthouses and harbors, forts or pier on the shore, or vice versa. Communication, moreover, is effected without any connection whatever between the two objects except the body of water in which the ships float or the lighthouse stands, the water being the whole medinm through which the message is transmitted. The system depends for its action upon harmonics, and its principle will be understood by a reference to the well-known fact that upon a musical note in a given key being sounded an object capable of emitting sound in the same key will, under certain conditions, sympathetically respond by emitting a sonnd similar to that which awakened its vibration.

It is, of course, a primary condition that the two objects shall be normally tuned in unison. Working upon this fixed principle, and utilizing the high conductivity of water for the transmission of sound, Captain Neale has constructed a signaling apparatus, which consists of a transmitting and receiving instrument, which, when in operation, are in no way connected with each other except through the medium of water. The apparatus as described by the London *Electrical Engineer* is monnted in two punts, the transmitter on one and the receiver on the other. The transmitter consists of a bell abont 16 inches diameter attached to the lower end of a framing which is fixed to the side of the punt, the heil being submerged about six feet. At the upper end of the framing is a crank handle, which is worked from the pnnt and actuates a doubie-heat hammer which strikes and sounds the hell. The Morse code is employed, and signaling is at present carried on by hand, but electricty is intended to be used. The operator gives the handle a quarter turn for the dots of the code, and a whole revolntion fnr the dashes. The receiver, whlch is on the second punt, consists of a a pair of metallic drums, ahout ten inches diameter, open at one end and fixed, mouth to mouth, upon a piece of hoard which is sandwiched in between them. These drums are snspended in the water, and are connected up with a small battery, and through it with a tape recording instrument. As at present arranged, the operator has an aconstic apparatus connected with the drums, by means of which he hears the sounds of the bell as they are received by the drums, and, by a manual arrangement, he records each sound on the tape.

Upon the occasion of the inspection, the two punts were moored in the Thames at Kingston, about two-thirds of a mile apart, and signaling was successfully carried on from one to the other. Messages were correctly transmitted and recorded, althongh natnrally somewhat slowly, owing to the apparatus helng at present worked by hand. The trial, however, ls said to have demonstrated the practical character of the invention and the correctness of the principles upon which it is based.

New Steel Alloys.

The announcement is made in the English journals of some new alloys for the manufacture of boriog and cutting tools, the claim being made for the new substances that they possess a hardness eqnal to that of tempered steel, with the additional advantage of not iosing their hardness when heated hy friction. In the production of these valuable alloys, pig iron, ferro-manganese, chromium and tnngsten are melted together in graphite crucibles under stick charcoal and calcined horax, the tnngsten and pig iron being melted in clay crucihles together with the har iron, the nickel, copper and aluminum heing subsequently added. The metal is at this time covered with stick charcoal only, and the alloys are cast in sand molds in the usual manner. For nail-cutting hlades, cutting blades for varinus machines, cutting-out tools, and similar employments, the alloy consists of a certain combination of pig iron, Swedish bar iron, ferro-manganese, chromlum, tungsten, aluminum, nickel and copper.

Days of the Tow-Boat Over.

Electrical propulsion of commercial boats on canals is no longer a theory, but a demonstrated success. The new power was successfully tested at the viliage of Brighton, four miles from Rochester, on the waterway of the Erie canal, November 17th. The old steamboat Ceres, now the Frank W. Hawley, was fitted with an electric motor by the Westinghonse Company instead of a boiler and engine, taking power from a trolley wire overhead. She started off without a hitch or hindrance. The electric current was taken from the Rochester-street railway, and used 500 volts power. The prlnciple is the same as that of the stree-car system, except that the return current is carried overhead the same as the supply current. The lateral movement of the boat, which allows it to pass another, is provided for by using a pliable wire for a trolley. The boat made from four to seven miles an hour. It is said it was capable of towing six other hoats at a good rate of speed. If power can be obtained from Niagara, as it is suggested it can be, 50 cents per day will get the power for a canal boat that lt takes four mules and two men to give it now. That means that 2½ cents will carry a hushel of grain from Bnffalo to New York, and that 2½ cents is going to deliver it in Buffalo from Duluth. Five cents brings a bushel of wheat from the wheat fields to the metropolis.

Electric Cooking at Half Price.

Some of the London Electrical supply firms are takng very sensible and practical steps to enable the public to readiiy enjoy the advantages of electric heating, says the Chicago *Journal of Commerce*. They are not only lending out electric cooking stoves to customers, but are prepared to supply a separate meter and charge half rates for cooking, which they can afford to do, ioasmuch as the consumption takes place during the day when the dynamos must gather electricity, and when there is little demand for it for lighting purposes. Besides these ovens there are breakfast cookers, in which eggs and hacon may he cooked on the breakfast table; electric plate-warmers, which are being ordered from London clnbs, for they can he kept in the dining room without any offensive smell; electric foot-warmers, hot plates, stew pans, kettles, flat irons, ornamental screens, which act as radiators of heat and warm a room; electric curling iron heaters for ladies and electric shaving pots for gentlemen.

Electricity Fires Benzine.

A singular accident recently happened at Buda-Pesth on an electric tramway line. A carboy of henzine fell on to the roadway from a passing van and was broken, the benzine running over the roadway. A short time afterward an electric car passed, taking its electricity from an underground conductor. It is snpposed that there must have been a spark between the tramcar and the conductor, which fired the henzine, for suddenly the roadway was in flames. Happily they did not last longer than ahout ten mlnutes, but sufficiently long to set fire to the tramcar, which had stopped, and to cause a panlc among the passengers.

An Electrical Dredge.

In New Zealand the ordinary bucket and ladder dredge is giving way to the electricaily worked dredge, by reason of the heavy expense the former entails in river work, and the necessity for ponderous machinery when it is used on rocky hottoms, and where the depth exceeds 35 or 40 feet. The plant is remarkably simple, and it is proposed to spend $2700 upon the same amount of work as formerly cost $8000, hesides having more time to give to paying work in consequence of the reduction in the amount of necessary repairs. Engioeers are heglnning to realize the amount that can be saved in one year by the work of the electrical dredge, and that the work can at the same time be better done than by the style of apparatus now in use.

Useful Information.

Ships Lost at Sea.

The annual loss of ships at sea, says the *Age of Steel*, in spite of improved methods in ship-building and the higher rate of security that follows, is more appalling than is generaliy supposed. The annual amount of tonnage turned out of the shipyards of marltime nations makes a huge total, and would probably he sooner or later out of business were it not for the accidents and disasters that are daily making driftwood of sailing ships and scrap iron of steamers. The losses in 1892, as tabulated by Lloyds and recently pnblished in London, show that during last year the gross tonnage of steamships alone lost aggregate 257,048 tons. This tonnage does not include ships of less than 100 tons. There were 215 steam vessels of all nationalities that by one form of disaster or another went off the list. Of these the United Kingdom supplied 105, having a gross tonnage of 144,746 tons, representing 1.69 per cent of the total steam tonnage owned hy Great Britain. Four British vessels were destroyed by fire, ten American and four others. England lost 13 steamships hy collision, Germany 6, France 4 and other countries 8. Under the heading "wrecked," 103 vessels are tahulated, England losing 54, France 8, Central and South America 6 and the United States 4. Of salling ships the mortuary record shows a loss of 793 vessels of over 100 tons each, the total tonnage being 368,176. Of these, 104 were abandoned at sea, 152 broken up or condemned, 29 burned, 41 iost in collision, 86 reported "missiog" and 349 wrecked. The principal commercial nations contributed to this table of losses as follows: United Kingdom 144 vessels, British colonies 90, United States 117, Holiand 20, France 45, Germany 54 and Russia 14. The money iosses involved represent an enormous aggregate of wealth dumped into the lockers of Davy Jones, for which insnrance supplies hut a partial redemption. In many cases it is possible that disaster might have been avoided, inasmuch as the science of navigation and the construction of ships is at a higher point of intelligence and efficiency than at any previous time. It may he that future progress in these directions will considerably lessen the hazards of our marine. It may be reasonahly assumed that it will, but the risks to life and property at sea, however minimized, will always he a serious factor with the merchant, the underwriter and the seaman.

Remedial Use of Apples.

Chemlcally the apple is composed of vegetable fiber, albumen, sugar chlorophyl, malic acid, gallic acid, lime, and much water, says the *Practitioner*. Furthermore, the German analysts say that the apple contains a larger percentage of phosphorus than any other fruit or vegetahle. The phosphorous is admirahly adapted for renewing the essential nervous matter—lecithin—of the hrain and spinal cord. It is, perhaps, for the same reason, rudely understood, that old Scandinavian tradltions represent the apple as the food of the gods, who, when they felt themselves to he growing feehle and infirm, resorted to this fruit, renewing their powers of mind and body. Also, the acids of the apple are of singular use for men of sedentary habits, whose livers are sluggish in action, those acids serving to eliminate from the body noxious matters, which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions and other allied troubles. Some such experience must have led to the custom of taking apple sauce with roast pork, rich goose, and like dishes. The malic acid of ripe apples, either raw or cooked, will neutralize any excess of chalky matter engendered by eating too much meat. It is also the fact that such ripe fruits as the apple, the pear, and the plnm, when taken ripe and without sugar, diminish acidity in the stomach, rather than provoke lt. Their vegetable sauces and juices are converted into alkaline carbonates, which tend to counteract acidity.

The Physical Strain Involved in High Speeds.

The exaction that modern railroad speed makes on the physical stamina of raiiroad men is demonstrated in the fact that seven engineers are required to take the Chicago flier out and seven back, says the Boston *Transcript*. The running time between New York and Chicago is twenty hours and the average speed is 48 miles an hour. Each engineer and engine runs three hours. Machine and man return with a slow train to their starting point to relieve the strain on hoth. Then the engineer is given forty hours rest before he goes on the flier agaio. This rest is ahsolute, no work of any kind being required of the engineer. Though the average speed is 48 miles an hour, the locomotive must at some points be driven at 60 or more. The physical strain on the man in the cab at those bursts of speed is something terrihle. The engineer has fifty things to look out for, and is beiog shaken and swayed all the time. The fireman is constantly feeding the insatiate furnace. On the run of the Empire State express three tons of coal are shoveled from the tender into the furnace between New York and Alhany. It is not wonderful that the engineers of this train are given alternate days for rest and recuperation. Fast travel not only wears out rails and machines, but human creatures' lives.

Round Shoulders Cured.

A woman physician recommended to the Boston *Herald* the following simple exercises, requiring little time and no apparatus, for the cure of all except very severe cases of round shoulders, when braces are also sometimes a necessity: "1. Raise arms before you shoulder high, extend arms sidewise, throw head hack, straighten head, move arms forward, lower arms, repeat ten times. 2. Stand erect, raise arms hefore, rise on tip toes, then throw arms as far hackward as possible, sink again on heels and drop arms to side, repeat ten times. 3. Raise arms with elbow bent shoulder high, bringing palms together in front of face, then with elhows still hent swing hoth arms vigorously backward as far as possible even with the shoulders, palms lookiog forward. This should he repeated several times, hut as the positlon is somewhat fatiguing, rest or change of exercise may be made hetween the movements."

Another simple movement designed to bring ahout a correct position of the shoulder blades consists of holding a cane or wand in both hands, throwing the head

back and carrying the stick from "above the head back and down the hips."

As the clothing, if too tight or unyielding about or over the shoulders, may help to produce round shoulders, both the under and outside waist should be comfortable, and hands over the shoulder of garments made of elastic.

The Lord Mayor of London.

The fountain of municipal honor in England undoubtedly springs from the Guildhall, London, which justly claims to be accounted the most ancient of our municipal halls, seeing that the lord mayors of the last eight centuries are, with justice, assumed to have had prototypes in the Roman prefect and the Saxon fortreye or portgrave.

For a considerable number of years the robes of the lord mayor, the court of aldermen and the common councilors have been settled with a precision that none save the most reckless of innovators would presume to disturb. The lord mayor himself has his "gold" robe for the occasion of the annual Guildhall banquet and for the times when he proceeds in state either to the new law courts or to the houses of parliament. The aldermen have their scarlet gowns, the sheriffs their distinctive and very handsome robes and chains, while the common councilors rejoice in gowns called "mazarines," it being generally understood that mazarine is a term for a particular dark blue color, although, according to some lexicographers, mazarine also means a drinking vessel and an old way of dressing fowls.

Then, again, when the sovereign comes into the city the lord mayor is bound to don a robe of crimson or purple velvet trimmed with ermine. At the time of this investiture he wears a massive gold chain, but when he is honored by re-election at the expiration of his term of office he wears two chains. The mace of silver gilt, surmounted by a royal crown and the imperial arms, is carried before the mayor by the authority of the charter of Edward III. While the city possesses no less than four swords, one called the "Pearl," presented by Queen Bess when she opened the first royal exchange, and so called from its being richly set with pearls. This sword precedes the chief magistrate on all occasions of rejoicing and festivity. The sword of state is carried before the lord mayor as an emblem of his sovereignty within the city proper. The "black" sword is used on fast days in Lent and at the death of any member of the royal family, while the fourth sword is that placed close to the lord mayor's chair at the central criminal court.—London Telegraph.

Artificial Leather.

A substitute for leather, called pantasote, has come into notice in this country within the last twelve or eighteen months, says the New York *Tribune*. The composition of it still remains a secret, but the producers claim that it contains no rubber nor animal substance of any kind. It is incombustible, or nearly so, odorless when scorched, and waterproof. Cold does not render it stiff or brittle, as would be the case with some compounds; nor, on the other hand, does it soften and become sticky under the influence of heat.

Pantasote leather, as marketed, consists of two or three layers of cloth, saturated with and glued together by the secret preparation. It then has the hue of leather, without special coloring matter, and also, it is asserted, the durability of the substance which it is designed to replace. The chief use to which the new material is devoted at present is the upholstering of seats in railway cars and steamships and for decorative purposes. While leather is reported to cost 20 cents a square foot, pantasote, guaranteed to be equally strong, is sold for less than half that price.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientific nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

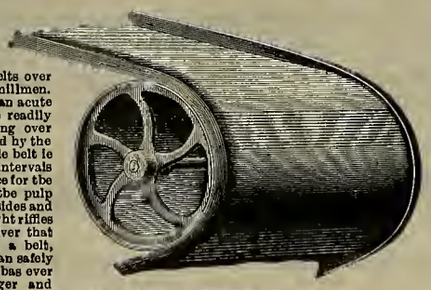
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Coast Industrial Notes.

—The Canadian Pacific quotes a Mid-winter Fair rate of $34.50 from Chicago to San Francisco.

—Work on the big irrigation dam near Modesto is progressing rapidly and the big structure will probably be completed in two weeks.

—Professor Lowe proposes to establish a meteorological station on Echo Mountain. He has ordered a complete set of instruments, which are now on the way from the East. Observations will be taken daily, beginning January 1st.

—The Santa Fe Railroad Company has a force of surveyors running a line and laying out a route for a new road to connect San Jacinto and Lakeview, a new settlement in Riverside county. The proposed road will furnish railroad facilities for a fine section of country. Work of constructing the new road is expected to begin without delay.

—The basalt block industry in Sonoma is booming. S. Schocken of Sonoma has now contracts on hand to deliver 700,000. In one week 72 carloads of blocks have been shipped to the metropolis over the San Francisco & North Pacific railway via Tiburon. This means lively times for Sonoma, as a large number of men will now find employment in the quarries, where they will earn between $3 and $5 per day.

—The Dickins-Hobart Lumber Company has been attached by the Humboldt Lumber Mill Company to recover $444. The lumber yards of the company on Berry street have also been attached. A meeting of the creditors of the Dickins-Hobart Lumber Company was held on October 4th, and J. B. Dowling was appointed trustee in the interest of creditors. The liabilities are about $21,000, and it is claimed the assets are worth about $27,000.

—The Northern Pacific railroad has ordered that all monthly salaries between $50 and $75 be cut 5 per cent; $75 to $100, 10 per cent. The reduction above $100 has already been made, but does not include trainmen, engineers, etc., and operators employed under contract. These contracts will not now be abrogated, but it is expected that the dullness of business will tend to induce such employes to accept the cut, as it was shown at the Boston international meeting of the Brotherhood of Railway Employes that the Northern Pacific employes were paid the highest scale of any in the United States or Canada.

—D. K. Trask, the receiver appointed to succeed J. F. Crank in the case of the Illinois Trust and Savings Bank vs. the Pacific Railway Company, has filed his final account and report in the Superior Court at Los Angeles. His account covers a period of seven months and twenty days. The report shows that the receipts from all sources were $201,434.02, and the total disbursements $200,042.75, leaving a cash balance on hand of $1391 27. The net earnings of the cable system during his receivership were $43,468.53, and a comparison between the first nine months of this year with those of 1892 shows an increase in favor of 1893 of $19,691.99.

—Goodall, Perkins & Co., have developed a coal mine in the Coffin tract, a new coal-field on Coos Bay, for which they paid $30,000. Within four weeks from the date of the purchase an English syndicate, which had been prospecting on the land, offered Goodall, Perkins & Co. $300,000 cash and $200,000 stock in a $1,000,000 company for the tract, which sums were declined, and the firm opened the mine on its own account. The first coal for export was taken out about three weeks ago. It turned out to be the best coal, it is claimed, ever uncovered at Coos Bay. The steamers Arcata and Arago bring down 700 tons each trip, and there is a 20 years' supply "in sight."

—A united effort will probably be made during the coming winter to induce the general government at Washington to lend aid to an irrigation proposition that will, when completed, cover a large area of what is now desert land. The plan is to build a dam in the Grand canyon of the Colorado, the framework of which will be steel of such strength as to resist any pressure that might be hurled against it during the summer floods. Above the framework bowlders will be placed as a protection, and thus it is proposed to make a sufficient fall to furnish water power for pumping the water to the plain above, where it may be carried in a big canal to the various locations where it is needed. The power will be furnished by turbine wheels, and a sufficient number of them may be brought into requisition to take out any amount of water desired.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

NEW MILL.—Sheep Ranch Cor. *Citizen*: A ten-stamp mill is soon to be erected on the Getchell gravel mine, about two miles and a half from this place. The prospects in this mine are very flattering.

Fresno.

THE SPENCER MINE. — *Republican*: W. G. Barnum was in Grub gulch last Monday and had an opportunity to investigate the Spencer mine near Fresno river, and makes an enthusiastic report of its condition. He brought down with him specimens of quartz taken from the mine at a depth of 160 feet on the incline, which makes a good showing of free gold and sulphurets, with traces of galena. The ledge is well defined along the surface and pitches into the mountain at an angle of about 45 degrees. The walls are of slate, well defined, and the ledge is from three to six feet in width. There is no vein matter whatever, but solid quartz from wall to wall, and is said to average from $75 to $100 per ton. From its characteristics, some miners think it a part of the extension of the Comstock ledge of Virginia City. Mr. Spencer, who is an old miner, has been prospecting the lode with no machinery outside of a windlass, but has a ten-stamp mill on the ground and intends to put up hoisting works on at least three points along the ledge.

Humbodt.

HUMBOLDT OIL LAND COMPANY. — *Western Watchman*, Nov. 18: This company has succeeded in getting all the machinery across the South Fork of Eel river to be set up at Briceland for renewed operations, and that the work of preparation for the new well is now going on.

It may be well at this time to review this enterprise. The Humboldt Oil Land Company holds 11,500 acres of choice oil locations, besides a number of valuable oil leases. On this as a basis the company organized, capitalizing at $1,000,000, divided into 1,000,000 shares of $1 each. The company has a well equipped boring outfit, piping, etc., costing some $6000, all in good order, has but a nominal indebtedness of a few hundred dollars. The prospect and outlook for the company are highly encouraging. Prof. H. G. Hanks, the mineralogist, as also Prof. Silliman, pronounce the crude oil obtained from natural seepage from these fields as some of the purest crude oil ever found, and they both argue that necessarily there are large deposits of oil here. In early days over 50 barrels were taken from one well in a short time, which together with the conclusions of experts leaves the matter of the richness of the Humboldt oil fields no longer a matter of doubt or speculation.

The company proposes to proceed with the work of boring systematically and are setting up the derrick at Briceland where the rock is very strongly impregnated with petrolenm, and prospect from that point. Having secured so large an area of choice location and leases it is estimated that when one good flowing well is struck the stock will rise to par, and continuing each new flowing well added will increase the value of the stock from 5 to 20 per cent. It is expected the drill will be in operation inside of 30 days.

Mono.

ON HALF TIME.—Bodie *Miner*: A draft was made last Friday evening in the force employed at the Standard mine, and since then the mill has been running only half time. In order to keep the mill running continuously it has been necessary lately to work some ore of a lower grade than would yield profitable returns, and the present move has for its object the experiment of working a higher grade of ore with a reduced force. How long the present arrangements will be continued cannot be told, everything being dependent upon the future development of the mine.

Johnny Farrell was in town this week from the Ward mine. He says the mine continues to look well, and thinks that when fully developed it will prove a big thing. A small run of ore is now being made at the mill, at the conclusion of which milling operations will be suspended for the season. During the winter Mr. Ward and two other men will remain at the mine, and next year the mill will be started earlier and will run longer than it has this year.

Nevada.

THE CENTENNIAL.—Virginia City *Chronicle*: Latest advices from Nevada City relative to the Centennial mine are to the following effect: The upper face of the second crosscut west is in splendid gravel, somewhat cemented, but giving very satisfactory gold tests—coarse gold and will pay well in sluicing. Another west crosscut will shortly be started, 100 feet farther south, which will intersect the same body of gravel, with expected improvement in both quantity and golden value. The mine is being very advantageously opened, at its best points, for active and practical sluicing operations as soon as deemed expedient. Weather colder, with a shower or so of rain but no snow.

MARBLE LEDGE FOUND.—*Transcript*, Nov. 23: A marble ledge has been discovered near North Bloomfield, and arrangements are being made to work it. The deposit is extensive and contains white marble, dove-colored and common slate. Messrs. Kallenberger, Hutchinson and Martin, of San Francisco, are the owners of this marble deposit and feel satisfied that they can find a ready market for all they can take out. The necessary machinery for cutting, dressing and polishing the marble will be put up and active work begun in a short time. This will be a new industry for Nevada county, and will give employment to a number of men. There are other deposits of marble in this part of the county, and the success of the undertaking at Bloomfield will no doubt be the means of causing some of the others to be worked.

MORE STAMPS STARTED.—*Transcript*, Nov. 22: For a number of months past the Omaha Mining Company has only been running 18 stamps in their mill. Superintendent George Mainhart informs us that Monday the additional stamps were started, making the number 28, which is the full capacity of the mill. Most of the ore going through the mill is being taken from the Lone Jack, and it is looking very well indeed, and work is still progressing in the Omaha.

AT THE EAST HARMONY.—*Transcript*, Nov. 22: One hundred carloads of gravel are being hoisted from the East Harmony mine every day, the value of which is about $2.50 per carload. A cleanup made recently, after a run of seventeen days, amounted to $3200. It is the company's intention to erect a ten-stamp mill in the spring and to increase the working force so that 200 carloads of gravel can be sent out of the mine every day.

STRUCK GRAVEL.—*Transcript*: The prospects at the San Jose drift gravel mine, on the Washington ridge, are very flattering. Recently some fine gravel has been struck, in which the gold is coarse and smooth-washed, which is a good indication that they are not far from the main channel. Several small nuggets have been found, ranging in value from $4 to $8.

STARTED UP.—*Union*, Nov. 21: Without the least jar or unnecessary friction, the splendid machinery at the Orleans mine was yesterday morning set in motion by Mr. Joseph Bennallack, who had the contract of removing the plant from its former location on the Prescott Hill claim to where it is now located on Madison Hill. The Orleans was situated about 200 yards southeast of the famous Empire mine. The character of its ore is identical with that of its justly celebrated neighbor, and there is every reason to believe, as many experienced miners claim, that it is an extension of the mother lode. The mine is owned by a strong company, of which Mr. George P. Thurston of San Francisco is a large stockholder and general manager. There is not a share of stock on the market for sale, but the company will put up all the capital necessary to develop the mine. When work was left off on the Orleans mine about three months ago by Ambrose Powning & Co. there was a good-sized ledge in sight which paid as high as $70 a ton. Mr. Thurston & Co. recently let a contract to sink a new shaft to the depth of 250 feet, about 100 feet east of the old works, also to erect the machinery. The contractors sunk the shaft 157 feet by the use of a whim, when water was encountered and work had to cease. Before the opening of spring a ten-stamp mill, which has already been purchased, will be put up, and it is expected to run through this mill all the ore taken from the mine.

HAD A GOOD TIME.—*Transcript*, Nov. 18: A large number of invited guests visited the Champion mine this afternoon to witness the starting up of the new machinery. Superintendent Fred Zeitler had made ample preparations to entertain the visitors. A fine lunch was served, with an abundance of drinkables and smokeables, and good cheer prevailed on all sides. Numerous speeches were made, the principal speakers being B. N. Shoecraft, Frank T. Nilon, Gus Kartechoke, (president of the company), William H. Martin, Fred Zeitler, Joseph Schuster, Fred Searls, J. G. O'Neill and others. The ponderous machinery was set in motion and worked like a charm, everything about it having been put up in the most thorough and substantial manner. With this plant the company will be able to sink to a depth of 5000 feet, if they so desire. For years it has been the theory of miners that the quartz ledges in Nevada mining district did not extend down deeper than 1200 or 1500 feet; that when that depth was reached the quartz pinched out, owing to the granite formation that was encountered. It is the intention of the Champion Company to test the truth or fallacy of this generally accepted theory, and that is why they have had such heavy hoisting and pumping machinery erected. They will sink their shaft a greater depth than has ever been attained in this district, and will settle to their own satisfaction, as well as others, the question of deep mining in this district.

AT THE INDEPENDENCE.—*Union*, Nov. 24: Messrs. Chavanne and Fricot, owners of the Independence mine of this place, have been rewarded for their enterprise and energy in developing their property by the contractors on Wednesday cutting a ledge over three feet in size in the tunnel which is now in 800 feet. The ledge is undoubtedly an extension of the famous Eureka and Idaho lodes, the formation and character of the quartz being identical to the above when first discovered. Messrs. Chavanne and Fricot have ample means to work the Independence.

Placer.

AWAITING MACHINERY.—*Herald*, Nov. 25: The Eclipse at Ophir is awaiting the arrival of some extensive machinery.

The Red Point is looking well, and it is reported the company will soon introduce water-power to run the big blower.

The repairs on the Mayflower mine, near Forest Hill, have been completed and work is going ahead again with a full force. The mine looks well.

Iowa Hill is now the liveliest camp in the county, and this owing principally to the fact that she has two of the best mines—the Horman and Morning Star. Both are paying big. There are also a number of smaller claims that are paying good dividends, the Big Dipper looking exceedingly well. The Pioneer mine at Damascus is running full blast and is a big help to the Iowa Hill camp.

That there is yet millions of gold in these parts has been demonstrated this summer at Dutch Flat. A great number of Chinamen, and a few white men, have been mining in the river beds on either side of that once famous mining camp, using only the historic rocker, bucket and pick and shovel. They have all made good wages, averaging from $3 to $10 a day. The heavy storms and the natural settling of the heavier material upon the bedrock have made it profitable to mine by the '49 process. A thousand men, we believe, could now make good wages mining in this simple way in the vicinity of Dutch Flat.

That hydraulicking will be in force again, and at an early date, is now almost a certainty. The impounding of the debris by the aid of restraining dams will soon be proven practicable, and the cost of the construction of the dams is not as expensive as at first thought. To this new lease of life credit is due to John Spaulding, who applied and was granted permission to build a dam at his Polar Star mine at Dutch Flat. It is now nearly completed. Messrs. Benyuard and Heuer, of the Debris Commission, inspected the dam last week and intimated that it would be satisfactory. If this experiment proves a success, there will be many such dams erected during the next year. It is the foundation of a boom in mining circles. The estimated cost of the Spaulding dam is about $1500. An evidence of the life that is brought into a mining camp by the working of even one mine was witnessed at Dutch Flat this week by a representative of the *Herald*. Thirty men were employed on the Spaulding dam and 30 men left town in the morning and returned at night, dinner buckets in hand.

AT THE DARDENELLS—Colfax *Sentinel*: The Dardenells mine at Forest Hill struck some immensely rich gravel this week. It is literally covered with gold. The mill is running steadily, and a big clean-up is expected.

The Big Dipper mine above Iowa Hill is looking better now than it has since the mine was discovered. The future prospects are very flattering, and the mine bids fair to be a bullion-producer for many years to come.

The Morning Star mine is getting better and better every day. This week the miners took out some dirt that was good for sore eyes to gaze upon. It looked as though the gold had been thrown there by the handfull. They have ground enough opened up to insure dividends for the next ten years to come.

Plumas.

THE REWARD MINE.—*National-Bulletin*: S. E. Swearingen, of Genesee, was in Quincy Saturday, and from him we learned that he was to resume work Monday on the Reward mine, owned by himself and S. Emrich, of Reno. The tunnel will be driven ahead. The face is now in solid quartz 500 feet below the surface. The ledge, on the surface, is 40 feet wide, says Mr. Swearingen. The ore prospects well in gold, silver and copper.

San Bernardino.

THE SALE OF GOLD MINES.—Contract of sale of the Gold Bug and Golden Rule mines near Grapevine Springs was filed for record Nov. 23, the consideration being $10,000. Several minor sales of gold mines in the Morongo mining district have been made.

Shasta.

MAKING IMPROVEMENTS.—*Courier*, Nov. 25: The Hidden Treasure Company is making many substantial improvements about the property below Iron Mountain. A large iron-pipe shute has been put in to run the ore down to the mill and new concentrators are to be put in soon. The mill is running only five of its ten stamps on account of the present lack of water for motive power. A force of ten men are employed there, and it is expected that a rich ore body will be encountered soon. It is the intention of the company to go ahead with the work of development in an energetic manner, and Mr. Dunbar says they intend to open up a great mine there if they have to sink down to China.

The Minnesota people are pushing work on their new mill on Spring creek above Shasta, and it is expected that the mill will be running in a couple of weeks. The mill will be a ten-stamp one, 850 pounds each. An enormous amount of ore is in sight, and the opinion of many mining men is that the Minnesota will rank second to no mine in the county. It was leased some time ago to Janney & Co. of Oregon, and the new management is prosecuting the development vigorously. A fine body of very rich ore was discovered a few days ago.

Mr. Hunt will resume work on the Skillen mine at Nigger Hill soon and will sink a shaft down on the ledge. A considerable amount of ore was crushed in the Shearer mill a short time ago with very satisfactory results, so it is reported. Mr. Hunt is a practical miner, and if more miners like him would take hold of the mines around Shasta, it would be a great thing for the district.

There are several parties looking at the Penrose claims, near Shasta. These claims are all good properties, but they are in an undeveloped state.

A custom quartz mill of five or ten stamps would fill a long felt want in Shasta. Water is plentiful, and an unlimited supply of fuel—pine, oak, etc.—grows on the surrounding hills. A splendid location for a mill is on the gulch below the old Catholic church foundation, and Mr. Fitch may put his mill there instead of at his mine.

One of the most promising ledges of this vicinity is the one owned by Thos. Spragins at Lower Springs. The vein extends north and south, and prospects well for over 1000 feet. The ledge is 3½ feet wide, and prospects high in free gold. Experienced mining men say that the mine is one of the best prospects in this section.

James. T. Hill is sacking ore from the Dol-

cothe at Lower Springs and expscts to have it milled at the Shearer mill at Salt creek.

J. C. Frick is running a tunnel to tap the old Spanish ledge, at the Bnckeye ranch. The Spanish mins is one of the best ledges in the district but lack of capital has rstarded any active dsvelopment of late years. Work will be pushsd ahead on the mine, and that a new mill will be in opsration there before long.

George Bystls and Bob Leivsay are pushing work on their mine north of Shasta, and are opening up a very promising mine. Some samples of free gold rock, which was struck a few days ago, indicate that the boys have a bonanza on their hands.

The Shearer mill on Salt creek, which has been doing some custom work the past month, is now rnnning on rock from the Cleveland, where a large body of ore was recsntly struck.

The Iler boys are working on their nsw 400-foot tunnsl on the ridge this side of the Lost Confidence, near the head of Spring creek.

Johnny Franck and partnsrs have struck soms fins ore in the old Tom Greene mins near French Gulch and stand a good show to take a fortune ont of the mine.

About thirty men are employed at the Gladstone.

NEW MILL.—Shasta *Democrat:* At Shasta, Mr. Fitch of Santa Crnz is erecting a five-stamp mill to test a mine recently purchased there.

Peter Schierer's ten-stamp mill on Middle creek has been hammering away on rock from the new ore body strnck in the Cleveland two weeks ago, with gratifying results.

The Hidden Treasure mine on Iron mountain is dropping five stamps on high-grade ore. The company is putting in concentrators and propose to put in ten more stamps soon. The water-power of Slick Rock limits them to running but five stamps at present.

At the Minnesota mine, leased by Jenny & Co. of Oregon City, located on Spring creek, they have their ten-stamp mill ready to crnsh ore. They have 1000 tons ready for the mill. The ore is high grade and if it mills free, great hopes are entertained for its fnture.

The Iler Bros.' group of mines on Iron monntain are being developed by a new tnnnel 400 feet long, which will tap their main ledge 600 feet deep. They are also running their arrastra with good results.

VAST BONY OF IRON.—Redding *Free Press:* Prof. Carr is attorney in a case now before the United States Land Office, wherein one Maxwell is contesting the claim of an Indian, who was allotted 40 acres, on the grounds that the Indian does not live npon the land, and that it is more valuable for mineral than agricultural purposes. One witness stated that a plow could not be used upon the land, as it was one solid mass of iron ore. Mr. Maxwell claims by location and purchase 160 acres of land containing iron ore of the finest quality, not including the land allotted to the Indian and for which he is contesting. This land lies in township 26, section 34, near Pit river, and about ten miles from Kennet, and it is said that the ore contained therein is of snch fine quality that horseshoes have been made from the crude material.

Sierra.

IMPORTANT QUARTZ DISCOVERY.—Plumas *National-Bulletin:* A recent and very important quartz discovery has been made in the Poker Flat mining district, in Sierra county, on the eastern slope of Mt. Fillmore, the location being about four miles sonth of the Pilot Peak mine in Plnmas. In his boyhood days, B. L. Jones passed over the spot and noticed the croppings. He mentioned this fact to T. H. Simmonds, a mining expert in the employ of C. B. Wingate of the Thistle Shaft mine. Mr. Simmonds at once secnred the services of Mr. Jones, and they went ont in search of the vein. After a long hnnt through the brush, they found it. Samples of the ore were obtained and sent to Mr. Wingate in San Francisco, who had it assayed. So well satisfied with the results was he that he ordered men pnt to work immediately to determine the extent of the ledge. The ledge, Mr. Simmonds says, is from 15 to 40 feet wide and can be traced for a mile, the distance covered by the locations made by himself and associates. It can be tapped at a depth of from 800 to 1000 feet. The ore carries a large amonnt of sulphnrets, and is what is called arsenical pyrites, or mispickel, characteristic of the central vein of the great mother lode extending through Tuolumne, Calaveras, Amador, El Dorado, Placer and Nevada connties. The same class of ore is fonnd in the Pilot Peak mine owned by Turner Bros. and others. The snlphurets will have to be ehipped and smelted. Messrs. Simmonds and Wingate will develop the property next spring. It is considered a very important discovery, and may lead to the inanguration of a big mining enterprise.

Siskiyou.

NEW MILLS.—Yreka *Journal,* Nov. 22: Three new qnartz mills are to be erected shortly in the Salmon river section, and new mining machinery is constantly received at the mines in that region since the completion of the new wagon road, the old system of packing on mnles having been a great detriment to the development of that rich mining district. More prospectors and mining experts have visited that section than ever before, and next spring and snmmer a big boom in both placer and qnartz mining is anticipated.

At Hnngry creek, in the Siskiyon foothills, on onr northern border, where considerable snow falls dnring the winter, the miners are fully prepared with snpplies to continne the work in the tunnels all winter, and by spring expect to have a large amonnt of quartz on hand for crushing.

Tuolumne.

STRIKE AT THE APP.—*Independent,* Nov. 25: The report was bronght to this city last Thnrsday night that this mine had strnck exceedingly rich rock—in fact, the piece exhibited shows largs chunks of gold sticking ont of the matrix. The qnartz rock itself is very similar to the famous Rawhide, except that the latter gold is fine and permeates the whole mass and the App mine gold is coarse and heavy. The latest find is from the new 800-foot level, and is, no donbt, a continnance of the same shoot befors found on the 700 level. This find is most interesting to the mining man, as it demonstrates the fact that gold being found in such rich quantities below what is gsnerally concedsd to be the barren zone, namely, from 400 to 600 feet, is most encouraging; but, possibly, the bowlder vein, or the mother lods proper, is not affected by ths zone in question, as in the eastern series of the mother lode, which has besn found in almost every instance in this county, Calaveras and Amador, when similar depths have been arrived at. This is what minsrs call the second make of gold, and when found is always permanent and lsting to great depths, hence their find is of the greatest importancs to prove our mines, if sxplored in depth, will be found rich, and may excel the famous mines of the northern counties, not excepting even those mines of the Grass Valley district.

THE RAWHINE.—The working shaft of this mine is now sunk to nearly 500 fest, and whsn this depth is reached a levsl will probably be rnn to tap the pay shoot. Work is being pushed rapidly ahead at the 300-foot level, and there is no abatement of the rich ore, while over one million dollare is really in sight. The ten stamps are kept constantly at work night and day, and each morning the plates and batteries have to be cleaned on account of the vast accumulation of amalgam. A new retort house is in consre of constrnction, and will be completed the fore part of next week. The euperintendent, W. A. Nevills, went to San Francisco last Tuesday, presumably with several thousand dollare' worth of bullion—two weeks' workings of the mine.

THE LAURA ANN NORTH STAR.—The shaft in the above mine is now sunk to a depth of 275 feet, and will be continned to the 400-foot level, and with the three shifts now at work that level will soon be reached. This shaft is on an even incline, which is necessary on account of the wavy vein. They now have a vein at present three feet in width, which shows free gold.

CHEROKEE.—The Last Chance mine, bonded by H. W. Williams, is located about a mile east of Cherokee. This mine was discovered in the early days, and worked down to the hard gronnd by a shaft 50 feet deep. The ore extracted paid as high as $70 per ton. The ehaft is now sunk 62 feet, while the vein matter ie about four feet wide in the bottom. The mine is now idle, the owner not having the meane to fnrther develop. If the shaft was snnk to the 100-foot level, this mine wonld show up well, with every chance in its favor of becoming a valnable property. Of course drifting and opening up on the shoot would be in order. Water can be procnred for power, with pressure of 200 feet. Formation, granite.

THE VIRGINIA.—The Virginia is in the same section as the Last Chance. The vein is small but very rich. Sulphurets value $1700 per ton; also carries free gold in paying quantities. This property only needs development to make it a paying inetitution.

THE DUFFIELD.—This mine is east again of the Virginia. A tunnel has been entered some 600 feet—a good-sized vein with sulphurets; value, $600 per ton. The mine has been etoped to snrface. Water can be had for power. Both these mines belong to the Scanavino brothers.

Yuba.

A RIVER-BOTTOM MINE.—Marysville *Appeal:* W. J. Forbes, who is the owner of the Old Industry Bar mine, situated six miles above Sicard Flat, on the Ynba river, is credited with having struck it rich. He has been nsing slnice boxes and from 30 to 40 inches of water. If the reports that have reached here are true, the eight men who have been working have made very good wages so far. Last week abont $600 was taken ont. This gold has floated down the river from some hydranlic mines years ago and is as fine as sand. The men started in to work in July and will be able to continue at work nntil the river raises abont two feet.

NEVADA.

Washoe District.

STRIKE IN YELLOW JACKET.—*Chronicle,* Nov. 23: A very rich body of ore was strnck in the Yellow Jacket mine yesterday, in the top of a raise from the 1100 level. The raise is np about 60 feet, and the ore was strnck near the east wall of the vein. The strike is of a very gratifying and encouraging character, and has every opportnnity to lead to something better. The ore already enconntered, which is gold-bearing, is exceedingly rich, and althongh there is not mnch of it in sight at present, it will cut a considerable figure in the month's ontpnt. It is also in a part of the mine where there is qnite a body of nnexplored gronnd. It is in the sonthern part of the mine abont 80 or 90 feet from the Kentnck bonndary, and there are 200 feet of gronnd above it and as much below that has never been opened. The vein is 20 feet wide at the place where the ore was fonnd. It gives the situation in the Jacket a hopefnl appearance.

THE COMSTOCK.—The reports of several Comstock mines for the week ending November 25 are as follows:

KENTUCK.—1100 level—The west crosscut from the sonth lateral drift is in 23 feet; face in porphyry and qnartz. Have resnmed work in the main sonth drift.

OCCIDENTAL.—During the week we have extracted from the west ledge above the 400 level abont ten tons of ore of the average value as per car samples of $54 per ton.

GOULD & CURRY.—200 level—West crosscnt 5 started in northwest drift 432 feet from main west drift has been advanced 9 feet during the past week; total length 765 feet; face in hard porphyry.

HALE & NORCROSS.—1300 level—We continne stoping out ore from the winze below this level, and extrscted during the week 37 cars of ore assaying $30.88 per ton per car sample, and 12 cars of ore, average assay per car sample $22.31 per ton.

CON. CAL. & VA.—1650 level—The drift running north from the foot of the npraise on the sill floor of this level has been extended during ths week 35 feet, total length 115 feet, continuing in porphyry and clay with an increase of qnartz which has some valne. The drift running north (at a point 52 fest down) from the winze sunk from ths west crosscut from the main northwest drift has been extended 10 feet, total length 100 feet, in porphyry, clay and quartz. The crosscut running east from this north drift—at a point 40 feet north from the winze—has besn extended 33 feet, total length 93 fest, continning in porphyry, clay and qnartz. The work of cutting out and timbering the 1000-foot station in the Con. Virginia shaft has been completed, and we are now about ready to commence drifting therefrom.

MEXICAN.—1485 level—The upraise started at a point 40 fast from the main north lateral drift and 100 feet north from the south line of ths mine has been carried up during the week 14 feet, total height 15 feet, continuing in a formation of porphyry, clay and quartz. Have continued jointly with the Ophir Company the work of making repairs in the Ophir shaft.

OPHIR.—1465 level—The crosscut running west from the main north drift at a point 124 feet eouth from the winze station and abont 300 feet north from the main shaft station has been extended dnring the week 23 feet, total length 191 feet, continuing in porphyry which carries streaks of quartz.

SIERRA NEVADA.—The south lateral drift from the intermediate tunnel has been advanced 20 feet, total length 240 feet; face in porphyry. The joint Sierra Nevada and Union north drift from the west drift, 1520 feet west of shaft, 900 level, is out 18 feet, total length 242 feet; face in small stringers of clay and quartz.

POTOSI.—The east crosscut 200 feet north of south line, 750 level, is ont 96 feet; face in porphyry and low-grade quartz. The north drift 35 feet above the 1100 level is out 80 feet; face shows bnnches of fair-grade ore. The sonth drift, 200 feet east of the Potosi winze, 1100 level, is out 42 feet, following a two-foot streak of qnartz that gives low assays. Discontinned the extraction of ore on the 17th. Shipped to the United States mint, Carson, 388 pounds crnde bullion.

CHOLLAR.—The north drift, 100 level, is out 170 feet; face in porphyry and low-grade qnartz. Are repairing the west drift, 100 level, and making the usual repairs in the main incline below the 930.

Riley District.

ANOTHER EL DORADO.—The *Record* eays Pioche is on the eve of another stampede equal to that which occurred when news of gold discoveries at Fergnson district were first reported. This time the scene is laid four miles west of the ranch of Robert Logan, in the Muddy. Reports of almost fabnlonsly rich finds have reached town, and quite a nnmber of onr townsmen have left for the new diggings. It is called the Riley district, from the fact that a prospector by that name has been working there for some time. The snrface there is a hard gravel cement, gold qnartz being found below the cement, which differe in placee in thickness. High assays are reported, and a rnsh from sonthern Utah and northern Arizona has already set in.

ARIZONA.

SUCCESSFUL LEACHING.—Cor. *Enterprise:* The leaching process of the Arizona Copper Company, started in Clifton on the 22d of last month, has proved a great snccess. A few drawbacks have been overcome with ease. There were worked 1650 tons of concentrates which prodnced 70 tons of copper, only less than half of one per cent of metal remaining in the tailings after being leached. The plant has a capacity of 100 tons daily and will probably be increased. An electric plant is to be pnt in to precipitate the copper. At present scrap iron is nsed which is procured in San Francisco. It takes abont one ponnd of scrap iron to precipitate one of copper. It is stated on good anthority that Wm. Church, for the Detroit Copper Company, will also pnt a leaching plant at Morenci in addition to the one in Clifton. The Clifton and Morenci smeltere have turned ont a great deal of copper lately, last month's run being the largest of either company.

NEW MINES ACQUIRED.—Phœnix *Herald:* Organizer Alley of the Phœnix Mining Company has secnred control of the Neshakaty and Colnmbia mines, adjoining the Phœnix property, and will develop them fully before turning them over to the company. The Neshakaty is an extension of the Phœnix mine and is equally rich in gold. It has been developed sufficiently to show a big vein and make it a valnable property. The Phœnix mine is turning ont lots of ore and when the mill is ready there will be hnndreds of tons on the dump to keep the stamps going incessantly. The work on that property is being done on levels and drifts and shows an immense deposit of ore. The mill is fast nearing completion and it is now expected that the hnndred stamps will begin dropping about the first of December.

BIG PROPERTY.—Phœnix *Herald:* Messrs. C. H. Gray and E. H. Hiller have been offered and have refnsed $5000 cash for a bond on their Arica gronp of gold mines, by an English syndicate, with further payments amonnting in the aggregate to $100,000.

With the same mail that bronght this offer came advices from ex-Sheriff Gray, who is working a force of men on the mines, that ths "Arica" is widening out and growing richer at every blast, being down now 66 feet and widening at the rate of two feet psr day.

As offsrs have been made for this propsrty from Dsnver, San Francisco and Los Angeles parties, it would sesm that the fame of the Miner is becoming noted, and, from all reports concerning it, the favorable reports are justified, not only because of the large amonnt of ore in sight, bnt of its great richness, ranging from $50 to $300 per ton, with streaks of ore running into the thousands, and all of it free milling.

FINE SILVER PROPERTY.—Kingman *Miner,* Nov. 11: Robert Gray has just finished his work on the Blne Bell mine, on Stockton Hill. In the Blne Bell Mr. Gray has a magnificent silver property. There are fonr shafts on the ledge sunk to an avsrage depth of 40 fest, and all showing a good grade of ore. The ledge is abont eight feet in width, and shows from two to four fest of solid ore fully 1500 feet in length. This ore body will mill abont 40 ounces silver and nearly an ounce in gold per ton. No better prospect can be found in the county than this. Should silver go np, Mr. Gray will realize a nice little snm of money from this mine.

The Blackfoot is tnrning out a great deal of rich ore, and will soon send in a carload to the sampler. The main tunnel is 200 feet nnder the hill, and a winze ennk to a depth of 40 feet from the tunnel level. From the bottom of the shaft a drift has been run north a little over 40 feet on ore running abont 600 ounces silver, 3 ounces gold and 15 per cent lead. The streak is abont eight inches in width. East of the shaft the ore is being stoped to the tunnel level. The mine presente the best ehowing of all claims in the hills outside of the Nighthawk mine.

The tunnel on the Miner's Hope is almost to the ledge. It will tap the vein at a depth of nearly 200 feet. The Hope is a good mine and is capable of producing large quantities of valuable ore. Robert Gray, of Stockton Hill, is the owner.

Work has been commenced on the Ark mill. Several men were taken to the mine Monday to begin preliminary work. Steam was up at the hoisting plant Tuesday, and water was being pumped ont of the main shaft. The new boiler will soon replace the old one, and then some work will be done on the mine.

A. M. McDuffee has had a carload of ore from the Rainbow mine worked at the sampler this week. Mr. McDuffee has one of the best lead properties in the county in the Rainbow, and, should capital be induced to purchase and pnt np reduction works near the mine, it wonld give employment to qnite an army of men.

The Gold Bng mine is now working 25 men.

J. C. Potts went out to White Hills this week to look after his mining interests there.

A carload of White Hills ore was ehipped to Pueblo yesterday by the White Hills Company.

A Mr. Marshall has made an important strike on the Norma mine, White Hills. The ore is said to be the richest ever taken from that property, and the pay streak is larger than any heretofore opened np.

IDAHO.

WORK AT THE STEMWINDER.—Wardner *News:* The Stemwinder mine and mill has been recently leased to James Cronin and Peter Cunningham, who at present employ ten men on development work. The proepecting that was in progress by the company when the mine was closed down last April is now reeumed and carried on in accordance with the plans then laid down. Favorable developments would canse the force of men to be increased to sufficient nnmbers to rnn the mill continnonsly.

OREGON.

MINING NEWS.—Jacksonville *Times,* Nov. 17: The placer miners are ready for the winter's rnn.

A great deal of prospecting is still going on in sonthern Oregon, and some discoveries which promise well are being made.

The Sterling Mining Co. still has a good supply of water, and has been engaged in piping for several months past, something never known before in the history of the mines.

Lindley & Co., of California, who purchased the Lncky Bart mine on Sardine creek some time since, have pnt np a first-class mill, which is running steadily on good ore. This promisee to be one of the best pieces of mining property in sonthern Oregon.

UPPER GRAVE CREEK MINES.—Rogne River *Courier:* Geo. Cronk reports good prospects among the placers on Upper Grave creek. Blalock & Son, he says, have struck a splendid ledge of copper, gold and silver on Onion creek. Abont 200 men are employed on the big ditch np there. The laborere get $1.75 a day and board themselves. The promoters of the project have established a commissary and sell groceries, etc., to the men. The ditch is to be 15 miles long, and, when complete, will have fully half a mile of perpendicular pressure. This is liable to tear things on Grave creek this winter.

Surveyor G. I. Brown spent a few days last week snrveying mining claims down Rogne river. He reports the Bybee placer almost ready for work with two monitors in position. Big apples 16 inches in circnmference ornamented the lnnch baskets on the expedition, and Mr. Brown thinks that conntry is good for other pnrpoees besides gold-mining.

Green Bartlett wae in from Deer creek Monday. He talks of erecting smelting works on his Preston Peak ledge, ae that is the only way the ore can be handled. The vein is 30 feet wide and the ore assays 80 per cent of copper and $15 per ton of gold. Work hae been snspended ont there this year on account of the snow.

SALE OF THE HAMMOND TRACT.—Ashland *Tidings,* Nov. 17: The sale of A. P. Hammond's tract of 82 acres, adjacent to the claims of the

Golden Fleece Company north of town, where the Hnntington mill is being set np, was consnmmated this week. The pnrchase was made by Geo. S. Sanford, who is here, and he bnys for himself and three capitalists of Long Island City, N. Y. His associates are Matthew J. Goldner, president of the Jackson & Vernon Ave. Improvement Co., M. F. Claven and Horatio S. Sanford, the latter of whom is mayor of Long Island City and one of the proprietors of Sanford's patent medicines. The price paid for the 82 acres was $2500. The same gold-bearing vein or dyke which the Golden Fleece Company is preparing to work, is located across this property, and it is the intention of the pnrchasers to put np either a Hnntington mill or a stamp mill at once. The plan is to pnt their mill below the Golden Fleece mill and nse for power the same water from the Anderson mining ditch.

The Golden Fleece mill will soon be rnnning, and a test made which will either encoursge or depress the high hopes entertained of an extensive mining industry from the beginning in this new direction started by Hill & Shannon.

It is reported from Gold Hill that Morton Lindley has struck a rich pay chnte in a new place on the Lncky Bart claim, on Sardine creek, and that the property is showing np well.

Fitch, Davis & Cardwell, who pnt np a Hnntington mill on their mine near Willow Springs, will add a concentrator to the machinery and start it in operation again this winter.

NEW MILL AT WORK.—Baker City *Democrat*, Nov. 20: Yesterday morning the stamps of the custom qnartz mill at the old Grayson mill site in Wilovale addition began dropping nnder the skillful snperintendence of manager E. P. Torrey.

The stamps were dropping on ore from the Emma, or old Kane mine, in the Virtne district, samples of which prospect well. All over ten ton lots will be worked at $5 per ton.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 29, 1893.

The silver market has been uneventful during the week. Quotations have varied hut slightly in New York, and in London there is a net loss of ⅛d. The feature of the week in metals has been the strong advance in copper. Last Saturday the quotation was $ro per hundred, and these figures were maintained Monday and Tuesday. The publication of the proposed new tariff, placing copper on the free list, seems to have had no effect. Lead is weak.

Silver and the Metals.

NEW YORK, Nov. 29.—Following are the closing prices for the week:

Mining Share Market.

SAN FRANCISCO, Nov. 29, 1893.

The Comstock market has failed to hold its own during the week. Yesterday there occurred a bad break. The selling was not confined to local dealers, for brokers who have agencies in Nevada sold heavily, and it looked as if people up that way were getting out. The volume of business was very large and the brokers must have made fat commissions.

In the Pacific Board at the morning session Epstein was notably a large seller. Con. California fell to $4@3.95; Best & Belcher to $2.50; and Yellow Jacket to $1.30. At the subsequent informal session prices had a further decline. Con. California fell to $3.65; Best & Belcher to $2.40; and nearly all the others went lower in proportion.

To-day the market opened steadier, under decreased offerings, the filling of shorts and the buying back of stocks sold at a profit a few days ago, hut the aggregate of the business done was small, and it looked as if much of the steam had gone out of the situation. At the 9:30 session Con. California sold at $3.60 up to $3.75, Best & Belcher at $2.40 to $2.45, Ophir at $r.75, and most of the others were steadier.

At the second session there was a small building up of prices among the "chipping" fraternity, but toward noon the market became weaker.

An event of the week has been the visit to Virginia City of James Rule and Herman Zadig, the well-known broker.

Drifting on the 1000 level of COR. Virginia was begun on Sunday, and will be pushed ahead as rapidly as possible. It will pass through virgin ground, and the price of the stock is quite likely to show numerous fluctuations before the 60 days' time it is expected to take to run the drift will have elapsed.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAME APPARATUS.—Wm. W. Lapham, S. F., Cal. No. 509,316. Dated Nov. 21, 1893. This is a game of the portable or pocket class. The object of the invention is to provide for a construction that can he easily folded into a small and convenient size so that it can be carried ahont in the pocket and readily unfolded for use. The game apparatus consists of concentric tnhular casings, playing men honsed in the inner casing and a flexible board wrapped aronnd the exterior of the inner casing and lying hetween it and the onter casing.

VEGETABLE OR FRUIT CRATE.—Harvey E. Bullock, Oakland, Cal. No. 507,991. Dated Nov. 7, 1893. The object of this invention is to provide a means for storage and transmission of delicate, perishable frnits, and other similar substances, and it consists in snbdividing the containing spaces, and thus separating the articles from each other to any desired extent, and at the same time establishing a perfect ventilation throngh the whole crate. The crate is preferably made with two closed sides, the other two sides and ends being covered with wire ganze or perforated plates for ventilating purposes, while the interior of the crate has supplemental strips with holes which are adapted to receive the bent ends of transverse rods. These rods snpport the removable and adjnstable shelves which extend across the case and enable the packer to place these shelves at any distance apart snd nse as many as may he desired, depending upon the character of the fruit or other article to he packed therein.

Cal. Debris Commission Notices.

NOTICE—THE CALIFORNIA DEBRIS COMMISSION having received petitions to mine by the hydraulic process from John Spaulding, in the Polar Star mine near Dutch Flat, and to deposit tailings behind a dam in Little Bear River: from Nathan Gardiner in the Red Hill mine near Ono, Shasta Co., and deposit tailings behind dams in Wash Pan Gulch; from A. Denmire, in the Denmire mine near Gold Lake, Sierra Co., to deposit tailings in an old hydraulic pit, gives notice that a meeting will be held at the office of the Commission, room 92, Flood Building San Francisco, on December 12th, 1893, at 1:30 P. M. On or before this hour and date all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission. W. H. Heuer, Corps of Engineers, U. S. A., Secretary of the Commission.

Assessment Notices.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees held on the fourteenth day of October, 1893, an assessment (No. 72) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, Room 69, Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1893, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 7th day of December, 1893, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

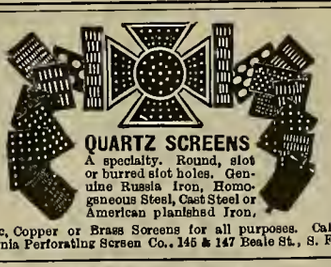
CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

Notice is hereby given that at a meeting of the Directors, held on the 22d of November, 1893, an assessment of $2 per share was levied upon the capital stock of the Corporation, payable at the office of the company, to the Secretary, on ths 22d day of December, 1893.

Any stock upon which this assessment shall remain unpaid on the 22d day of December, 1893, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold Monday, the 8th day of January, 1894, at the office of the company, at 1 o'clock P. M. of said date, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

MORGAN BACKUS, Secretary.

Office—408 Sacramento St.



QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron,
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

FOR SALE CHEAP.
A Complete Assay Laboratory and Chemicals.
Address J. A. SCHARLIN, 124 Montgomery Avenue, San Francisco, Cal.

Professional.

STEPHEN H. EMMENS,
Consulting Engineer and Chemist,
165 Crocker Building, San Francisco, Cal.

EMMENS & CO.,
Bankers and Agents.
165 Crocker Building, San Francisco, Cal.
APPROVED Gold Properties Organized and Stocked.

EDMUND B. KIRBY,
Consulting Mining Engineer and Metallurgist
No. 9 Windsor Hotel Blk., DENVER, COLO.
SPECIALTY—The Expert Examination of Mining Investments and Metallurgical Enterprises.

C. A. OGDEN. W. N. JEAU.
JEHU & OGDEN,
Chemical Laboratory and Assay Office.
(Formerly Evans' Assay Office.)
628 MONTGOMERY ST., San Francisco,
ROOMS 46 and 47 MONTGOMERY BLOCK.
Ore Assays, Analyses of Minerals, Waters, all Technical products, etc., made.
Lessons given in Assaying and Chemistry.

Nevada Metallurgical Works,
NO. 23 STEVENSON STREET,
NEAR FIRST AND MARKET STS., SAN FRANCISCO.
C. A. LUCKHARDT, Manager.
ESTABLISHED 1869.
ORES WORKED BY ANY PROCESS.
ORES SAMPLED.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines plans and reports furnished.
C. A. LUCKHARDT & CO.
(Formerly Huhn & Luckhardt),
MINING ENGINEERS & METALLURGISTS.

EVERETTE'S MINING OFFICE.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
Mining Law, Mine Examinations, Metallurgy.
ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon 'Title and Exact Value' of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the *mineral* or *coal* resources of the entire Pacific Northwest, will be honestly given.
DR. WILLIS E. EVERETTE, 1318 E. ST.,
Tacoma, State of Washington, U. S. A.

MANUFACTURERS FOR THIRTY-THREE YEARS.

CALIFORNIA WIRE WORKS

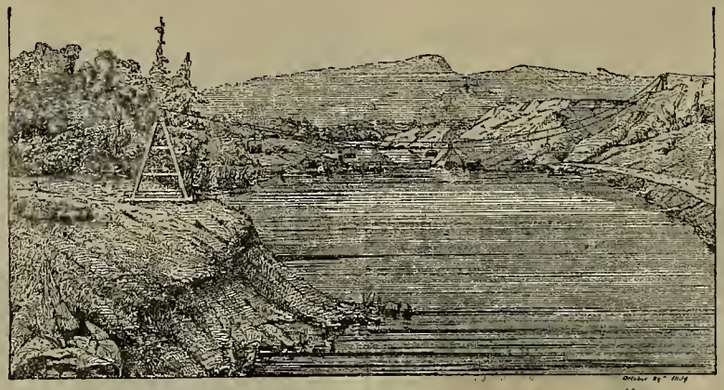
OFFICE, 9 FREMONT ST., SAN FRANCISCO, CAL.

LOS ANGELES AGENCY, LOS ANGELES, CAL. PORTLAND AGENCY, PORTLAND, OREGON.

WIRE ROPES
For Mining, Hoisting, Transmission of Power, Etc.

WIRE CABLES
For Cable Railways, Etc.

WIRE RIGGING
For Shipe, Derricks, Etc.



WIRE of all kinds
Best Steel.

WIRE NAILS,

BARBED WIRE,

THE McGLEW ORE CONCENTRATOR COMPANY.

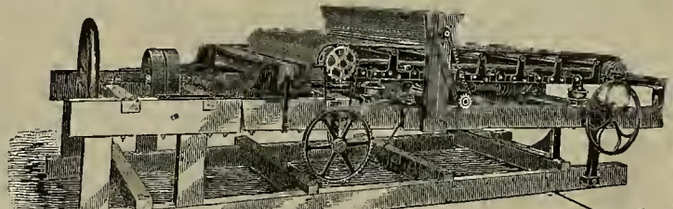
{PATENTED May 5th, 1893.} CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. {FRANK BARRERE, Secretary.}

CAN BE SEEN IN OPERATION AT THE COMPANY'S WORKS.....132 MAIN STREET, SAN FRANCISCO, CAL.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$850 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

MR. THOS. McGLEW, President McGlew Ore Concentrator Company—Dear Sir: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a True, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in benefiting my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One men attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

FULTON ENGINEERING AND SHIP-BUILDING WORKS.

Successors to FULTON IRON WORKS (Hinckley, Spiers & Hayes), and F. A. HUNTINGTON.

OFFICE AND BRANCH WORKS: 213 FIRST STREET. - - - - MAIN WORKS: HARBOR VIEW, SAN FRANCISCO, CAL.

MINING AND MILLING MACHINERY.

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

Manufacturers of the TUSTIN PULVERIZER: Adapted to Wet or Dry Crushing.

Also the well-known HUNTINGTON CENTRIFUGAL ROLLER QUARTZ MILL.

Special Descriptive Circulars of these Mills sent on application.

Specialties Manufactured by us:—"HUNTINGTON" BLAKE ROCK BREAKER; "FULTON" BLAKE ROCK BREAKER; TRUE VANNERS; "BOSS" CONTINUOUS [illegible] STEM.

Manufacturers of all kinds of ELECTRIC LIGHT AND ELECTRIC R. R. AND [illegible]ABLE R. R. PLANTS. STEAM ENGINES—Plain Slide Valve, Corliss High Pressure, Corliss Compound, [illegible]ondensing & Non-Condensing.

Agents and Manufacturers of the De La VERGNE REFRIGERATING [illegible]CHINES, FILTERS OF THE NEW YORK FILTER COMPANY.

Sole Agents for THE DEANE STEAM PUMP, ARMINGTON & [illegible]S ENGINES, LEFFEL WATER WHEELS.

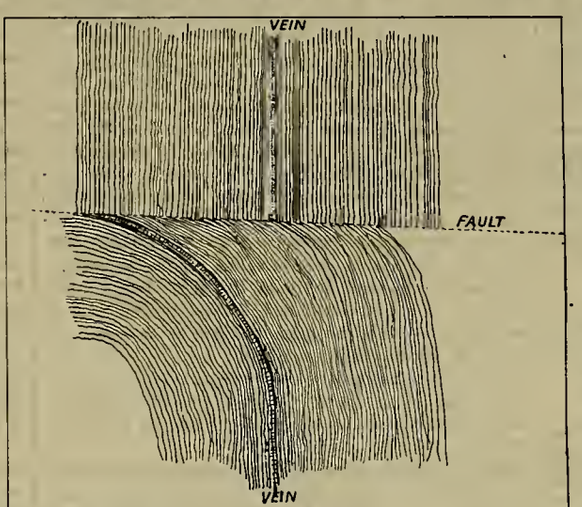
Faults in California Mines.

By W. H. Storms, Assistant in Field, in Eleventh State Mineralogist's Report.

The formation in which the Coyote vein, in San Diego county, has formed is micaceous and hornblende schist and gneissoid rock. Hornblende granite and dykes of diorite also occur in the vicinity of the vein. The Coyote mine is a quartz vein from two to four feet in width. The rock is iron-stained and occasionally shows free gold. The vein is developed by two shafts—one about 20 and the other nearly 80 feet in depth—and strikes 5° north of east, having a dip of 46° to the south. The vein appeared to cut the formation at a small angle. A fault, which has occurred within the vein, had evidently puzzled the owners, as at the bottom of the 20-foot shaft they had developed eight feet of what looked like solid quartz. The vein is really but four feet in width at that point, but the fault, cutting downward at an angle of 45° and crossing the strike of the vein at an angle of 27°, had allowed the hanging-wall side of the fault to slip downward, thus doubling the width of quartz, which was much shattered. The miners had quit work, leaving what they considered well enough alone. In the deeper shaft the fault had carried the hanging-wall down and to the east a few feet, and the vein was lost altogether. A short drift had been run into the hanging-wall, but, not finding the vein, work had been suspended. The vein lies on the footwall side, and not more than four or five feet from the line of the slip.

One of the most interesting mines in Los Angeles county is located in the rugged mountains about eight miles from the town of Azusa, in the San Gabriel canyon. It is commonly known as the Kelsey mine, and has become famous as a producer of silver ore of fabulous richness.



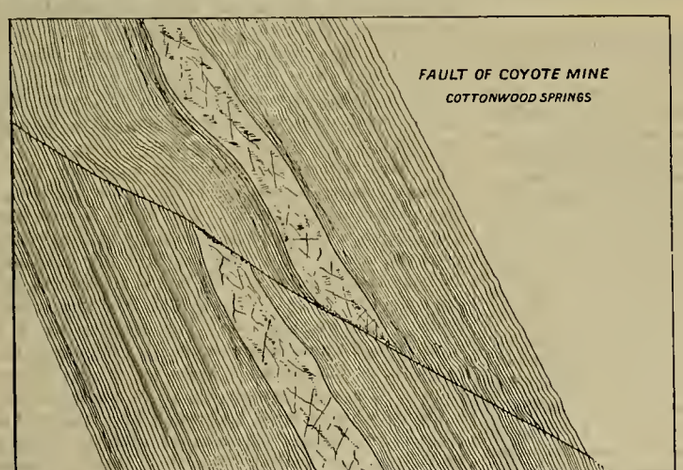
FAULTING AND TORSION OF THE KELSEY VEIN

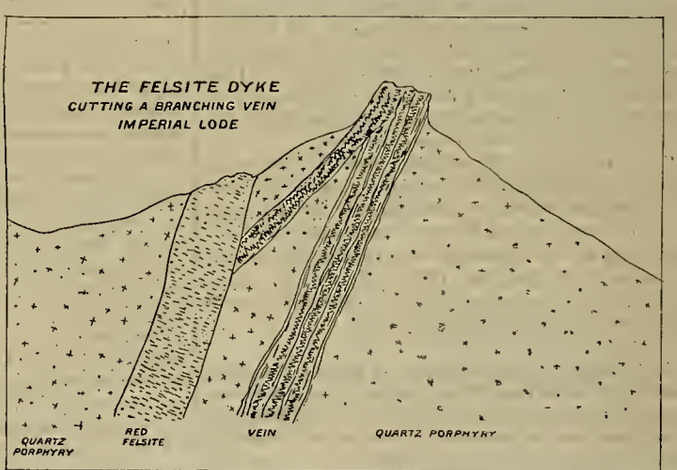
The country is made up almost entirely of metamorphic rocks, having schistose, gneissoid, and massive structure. Both hornblende and mica occur in these rocks abundantly, the former being frequently altered to chlorate, or by further change to epidote. Dikes of porphyritic rock have been intruded into the crystalline schists. In the immediate vicinity of the Kelsey vein are intrusions of a dark green, much decomposed and shattered rock, probably diorite. Faults, great and small, are numerous throughout the region. Within a few hundred feet of the mine is a great fault which may be plainly seen cutting the mountain. The displacement must reach many hundreds of feet. It has resulted in bringing in contact on a horizontal plane, rocks of entirely different character. On the south side of the fault the rocks are made up of quite regularly bedded micaceous sandstones, more or less schistose, and having a prevailing buff or light gray color. These rocks dip east at an angle of 20° to 30°. On the north side of the fault the rocks are harder, of a dark gray color, and containing considerable hornblende. These rocks are more gneissoid and massive than schistose. The dip is much less regular than on the south side of the displacement. Large, lenticular masses of quartzose and feldspathic rock are of frequent occurrence in the hornblende gniess, evidently the result of the segregation of the contained minerals. On the whole there is much more evidence of the disturbance on the north side of the fault than on the south side. It is in this area of greatly disturbed strata that the Kelsey vein has formed.

The vein is of the fissure type and occupies the line of a fault plane, that at first, perhaps, was a mere crack, but which has become enlarged by the movement upon themselves of the rock masses forming the walls, resulting in a grinding and crushing of the rocks by the attrition and pressure incident to this movement. Into this crevice mineral waters found their way, carrying in solution the minerals now constituting the vein.

The third illustration shows a curious formation in San Bernardino county, on the Imperial lode. At one point on the course of the vein, where it is joined by one of the branching spurs, the felsitic dike has intersected the smaller vein. The occurrence is plainly seen in a cut made at this place, where rich ore was found.

It will be noticed that both the main vein and the spur occur in the quartz porphyry, and that the red felsite cuts the smaller vein. The displacement on the surface along the strike of the vein is nearly 40 feet. This does not show in the cross-section.





From an advance copy of the annual report of the United States Chief Engineers for 1893 it is learned that Chief Casey concurs in Col. Mendell's report that the entrance to the Golden Gate is perfect and needs no improvement. Recommendation is made that $152,000 be appropriated for the channel work in the San Joaquin river, and $9100 is recommended for snagging work in the Mokelumne. An appropriation of $345,000 is asked for the Sacramento and Feather rivers; during the past fiscal year there was expended on these rivers $22,856. Major Heuer reports adversely regarding the proposed improvement of the San Joaquin between Hill's Ferry and Firebaugh's Ferry, and against the proposed improvement of the Stanislaus, Navarro, Merced and Tuolumne rivers. Congressman Caminetti, who is a member of the Congressional committee on commerce, is still engaged in personally inspecting the rivers and harbors of the State.

The revival of the Virginia (Nev.) *Territorial Enterprise*, after some months' suspension, is worthy of note. Time was when, in a minor way, the *Enterprise* was as much of a bonanza as the Comstock itself. Its decadence dated from the decay of the great interests of which it was the leading exponent, and its resurrection from the newspaper graveyard is no less a surprise than would be news that the halcyon days of Con. Virginia had come again. Myriads of memories of Nevada journalism cluster round the old *Enterprise*, and every newspaper man on the coast will be glad to chronicle the event of its resuscitation.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 383.

MINERAL exhibits for the Midwinter Fair will be carried by the Southern Pacific Railroad Company free of charge from points west of El Paso, Texas; Deming, New Mexico; Ogden, Utah; south of Portland, Oregon; and north of Mojave.

DURING the week Westall & Hughes have been granted a license by the Debris Commission to work the New York mine, in Sierra county. Permission was also granted the Quincy Water and Mining Company to build four restraining dams at the Spanish Ranch mines in Plumas county.

UNDER the provisions of the proposed tariff bill, it transpires that there would be an annual deficit of $60,000,000. It is proposed by those in charge of the matter that an income tax be made to supplement the deficiency. Light has not yet broken on that phase of the financial darkness. The situation calls to mind the inscription on the tombstone in the Pike county cemetery: "Here lieth the mortal remains of Jos. Bowers; he was well; he would be better; he took medicine——and here he is."

SENATOR JONES, of Nevada, says that his observation of financial affairs confirms him in the opinion expressed by himself and other silver advocates prior to the passage of the bill repealing the Sherman purchasing silver act, that there will be no material revival of business because of that action by Congress. He says that he does not expect to see any legislation which will materially benefit silver during the present administration.

ELSEWHERE in this issue appears a communication entitled "Advertise Your Mines," printed as received from an experienced mining man now resident in San Francisco. It is given place for the truths it contains, and, primarily, because it voices the beliefs of a good many correspondents who lack the facility of expression possessed by the author of the article to which we refer. The subject is an interesting one, and of present import to hundreds of people, who, whether they agree or disagree with "Investor," will note that, in some degree at least, his experience is coincident with their own.

IT is estimated that Colorado's gold product will aggregate $9,000,000 this year—an increase of nearly $3,500,000 over that of last year. The most of the Colorado gold ore is low grade, thus requiring a large amount of handling and incidentally giving employment to a larger number of men than where high-grade ore is the rule. The slump in silver has turned the Centennial State's attention largely to gold-producing, and the Colorado miners hope by increased effort in that direction to find compensation for the depreciation in the sister metal.

The President's Message.

Congress met in regular session last Monday and the President's message was read. By reason of the financial stringency, the adverse silver legislation, the Hawaiian imbroglio and the impending tariff "reform," the message was looked forward to with more than usual interest. It is a dull document of 15,000 words, chiefly remarkable for what it does not say, and is universally commended, in England. What is good is not new, and what is new is not good.

Regarding the repeal of the silver-purchasing clause of the Sherman law President Cleveland says:

> The recent repeal of the provisions of the law requiring the purchase of silver bullion by the Government as a feature of our monetary scheme made an entire change in the complexion of our currency affairs. I do not doubt that the ultimate result of this action will be most salutary and far-reaching.
>
> In the nature of things, however, it is impossible to know at this time precisely what conditions will be brought about by the change, or what, if any, supplementary legislation may in the light of such conditions appear to be essential or expedient. Of course, after the recent financial perturbation, time is necessary for the re-establishment of business confidence. When, however, through this restored confidence, the money which has been frightened into hoarding places is returned to trade and enterprise, a survey of the situation will probably disclose a safe path leading to a permanently sound currency abundantly sufficient to meet every requirement of our increasing population and business.
>
> In the pursuit of this object we should resolutely turn away from all hurry and temporary expedients, determined to be content with nothing less than a lasting and comprehensive financial plan. In these circumstances I am convinced that a reasonable delay in dealing with this subject, instead of being injurious, will increase the probability of wise action.

A vague hope that "a survey of the situation will disclose a safe path" is not of much present practical avail. He says that the deficiency in the treasury will be about $28,000,000 at the close of the fiscal year, June 30, 1894. This is believed to be an error. There is already a deficiency of $30,000,000 during the five months of the current fiscal year, and men at the seat of government who have given careful study to the matter say that the deficiency will be somewhere between $50,000,000 and $60,000,000. Information, to be of value, must be accurate.

Regarding the tariff, he thinks, like Gen. Hancock, that the tariff "is a local issue," and, if local discrimination is insisted upon (which he hopes will not be the case), the new tariff bill will have a hard time of it.

On the Hawaiian question he vouchsafes no information to any one in or out of Congress, beyond the general statement that he knows what he is doing, and when it is done he will let Congress know.

He upholds civil service reform, makes a manly plea for economy in public expenditures and gives extended statistics, which are condensed from the reports of his secretaries and subordinates; and, while nothing positive or conclusive can be derived from a perusal of the message, which is in its entirety a disappointment, it is evident that the dominant idea the President desires to convey is that he favors tariff reform, and wants the present Congress to pass the Wilson tariff bill.

ONCE in a while some writer for the agricultural papers arouses to the greatness and multiplicity of the virtues of the mule and writes a paragraph on the subject. Then the matter drops and the excellences of the long-eared musician are forgotten or are remembered faintly by those who believe that the great worth of the hybrid is tempered by a yet greater crassedness pure and undefiled. Perhaps this is the reason that so few farmers have seen their profit in raising these long-eared embodiments of energy and melody. The popular notion seems to be that mules are of all created beings (except, perhaps, the mule's father) the most contrary, and have the nimblest and most untrustworthy of heels. But there are those who, knowing the mule well from long acquaintance, declare that no better beast of burden lives; that if properly treated and well trained in the earlier decades of their existence they are good-tempered, quiet and reasonably obedient; that to raise a mule requires less outlay of care and cash than will be required in raising a colt of like age; that when raised the mule will bring a better price than can be got for the average colt of the same size and age; and that the mule is tougher, will live far longer, do more work, and some time or other will die harder than will the best horse ever known.

PERSONAL investigation on the part of the members of the California Debris Commission discloses numerous novel plans regarding the impounding of the debris, plans, too, of a practical nature. The impounding dams need not necessarily be of stone; brush, logs, rubble are found to be satisfactory material. In one case the hydraulic system itself was used in constructing the required impounding dam. The nozzle was turned on a hill, and bowlders and cobblestones sent whirling to the exact site of the proposed dam, the work being so cleverly done as to meet all legal requirements and receive the sanction of the Commission.

Deep Mining at Nevada City.

The notable revival of mining operations in the Nevada City district has its origin in two distinct causes, viz., the recent heavy investment of capital in gold-mining enterprises, and a sudden and authentic acquisition of knowledge that the mines were not worked out, as had been supposed. The mines of the Nevada City district are not deep, in the sense that they are deep on the Comstock, or even in the Grass Valley district. Some years since, it had appeared to be established that when a depth of 1000 or 1200 feet, at the outside, was reached, either the ledge pinched out or barren rock was encountered, and operations could not be profitably carried on beyond that point. Practice accorded with this theory and seemed to be fully justified by experience. Thus we find that four important mines of the district—the Champion, the Providence, the Nevada City and the Mountaineer—all several years since reached a depth on the ledge averaging 1200 feet, and effort to sink farther was abandoned, or about to be abandoned. Operations had thereafter been confined to the upper workings, to tunnels, or have ceased altogether.

But a distinct change has now taken place in the method of operation. It was discovered in one or two instances that the ledge did not disappear, or that the quartz was not uniformly barren at low depths.

Old theories have been exploded and old practice reversed. Renewed activity has marked the conduct of these four mines. In three of the mines the shaft has been steadily sunk in the last year or two, and in the fourth—the Nevada City—it is understood preparations are being made for similar work. The surface works are now being enlarged and improved for that purpose.

Perhaps the most noteworthy convert to the theory of the practicability of deep mining in the Nevada district is the management of the Champion, on Deer creek, one mile west of the town. The company has just replaced its old hoisting plant with another entirely new and very powerful, sufficient to carry on operations at a depth of 5000 feet on the incline. The present shaft depth is about 1300 feet, and one eight-inch and one six-inch plunger pump are used. The fly-wheel has an inside diameter of 9 feet, face 14 inches. Seven strokes per minute, with a four-foot stroke, is the average speed. The shaft is double-compartment, with separate hoists for each compartment. Twenty-one hundred feet of round wire rope (⅞ inch) are on each drum. Longer ropes will be used when required. Three water-wheels are used, and their power will be increased almost indefinitely by enlarging the nozzles, plenty of water, under a 218-foot head, being available. The Champion ledge pitches to the east at an average incline of about 40 degrees.

The Champion is in pay ore at the 1300-foot level, said here to average about $14 per ton. The cost of mining is about $2 per ton. The amount of dead work is not great. The ore averages perhaps six per cent of sulphurets, running from $80 to $150 per ton, which are treated in the chlorination works at the mine. Three tons are treated daily. The mine supplies a mill of 30 stamps, which runs day and night. It is certainly safe to say that milling and other expenses are not over $3 per ton, making $5 in all. It would appear that deep mining at the Champion has been demonstrated to be a success.

The experience of the Providence mine may also be given as another illustration of the entire feasibility of deep mining in this district. The shaft is now down about 1500 feet on the ledge. The dip of the ledge is about 30°, making the vertical depth of the mine about the same as the Champion. The cost of mining and milling at the Providence is stated by Col. Davis, the superintendent, to be $4.20 per ton. The company has a 40-stamp mill, of which 30 are constantly dropping. They have their own chlorination works for treatment of sulphurets. The sulphurets carry about 15 ounces of silver to the ton, which is saved, and which pays the total expense of chlorination. The average value of ore in the Providence is not a matter of public knowledge, but that it is great enough to afford a handsome margin of profit to the owners is evident from the energy of their operations during the past year, the enlargement of their surface works and the increased work mapped out for the futnre.

The results obtained from deep mining in these instances have not only been highly satisfactory to the several companies, but they are instructive and full of encouragement to all the other considerable mines in the district. They have given an impetus to mining operations that is of the highest benefit to all. They have shown the way to others who have heretofore feared to venture deep into the bowels of the earth. The ore shoots at these depths are just as considerable, and the ore just as certain to be pay as in the upper levels. From the present outlook, it is not too much to expect that the depth on the incline in some of the Nevada City mines will eventually reach a point equal to the depth of the

Idaho in Grass Valley, which is something like 2100 feet, vertical—the deepest in California. The Champion is now sinking at the rate of 12 feet per week—600 feet per year—and will continue.

In Memoriam.

It is with feelings of personal regret that the MINING AND SCIENTIFIC PRESS chronicles the death of Mr. C. H. Aaron, which took place in this city last Monday, the 4th inst. While ascending the front steps of his home on Thanksgiving evening, he slipped and fell hackward, striking on the pavement and fracturing his skull. Surgical aid was powerless, and he lingered in a comatose condition till death ensued.

For twenty years Mr. Aaron's writings have appeared in these columns, and thousands of letters from all parts of the country attest the value attached to his articles. He was a specialist on mining themes, and his published works have attained a large sale in this and other countries. He was a quiet, unassuming man, versed in mining and metallurgy, a good friend, an untiring worker, and leaves behind him a rich legacy in the friendly remembrance of his associates and the record of an honest, useful and upright life.

He added largely to the permanent literature of metallurgy in this country.

Like all progressive men, Mr. Aaron was duly modest. In the preface to the latest edition of his work on assaying he says:

"In preparing this second edition I have not been deterred from making alterations, and, as I hope, improvements, hy any fears which may he produced by the tacit admission that the first was not all that it might have been. Of those who have taken that as their guide, I have yet to hear of one who has been led astray; nevertheless I candidly think that all such may now be the gainers by laying that aside and taking this:"

And now, when

His part in all the pomp that fills
Ths circuit of the emsrald hills
Is that his grave is grsen

It may be said that his death is a loss to science and his life and his works a monument of painstaking, conscientious energy, which shall endure till all remembrance of him who writes and him who rests from his lahors shall have melted like streaks of morning cloud into the illimitable azure of eternity.

Free Lumber.

The new tariff bill which it is proposed to pass during the present session of Congress puts lumber on the free list.

The present duty is $2.50 per thousand.

The lumbermen of California, Oregon and Washington, regardless of political opinions, are united in opposition to removing this protective duty.

It is figured by experts that $50,000,000 is invested in the lumber industry of this coast. In the three States mentioned there are 850 mills where lumber is manufactnred and 404 shingle mills, whose output in 1892 was 2,300,000,000 feet lumber and 2,200,000,000 shingles, representing an aggregate valne of $27,000,000. About 26,000 men are employed, to whom is annually paid wages aggregating $18,000,000.

The lumber business is the great industry of the two States to the north of us. Last year our two sister commonwealths sent 325,000,000 feet of lumher into this State, and shipped 150,000,000 feet of lumber and 1,100,000,000 shingles east of the Rockies.

British Colnmbia, which has a larger timher area than the three coast States, is the chief competitor in the lumber husiness. Chinese and Kanakas are largely employed, at low wages, and the removal of the dnty of $2.50 would give our British neighbors a good market at the expense of the 26,000 well-paid white men and their employers.

The chairman of the Washington State Democratic Committee, Mr. Henry Drum, has already bought a sawmill in British Columhia, and others are getting ready to do likewise.

ELSEWHERE is pnhlished the report of the California Dehris Commission to the Secretary of War, and hy him transmitted to Congress last Tuesday. In addition to the facts already published and a statement of circumstances already familiar to many of our readers, it officially presents statements of general interest, and is of importance to every one directly or indirectly concerned in the matter of mining in this State.

RAIN OR SHINE makes no difference in the progress of work at the Midwinter Fair site. It looks now as though the great exposition would he opened on time—January 1, 1894. Every exchange received at this office from all parts of the coast has plans and practical projects looking to a proper showing of the mineral wealth of the coast.

Report of the California Debris Commission.

The report of the California Dehris Commission was laid before Congress last Tuesday. It says:

In cases where mining properties are large and hydraulic process is to be operated on a large scale, it is indispensable that the project be represented by a full written description and by full drawings. These drawings will show the position and extent of the storage reservoirs and means proposed for restraioing detritus, anó generally all that is necessary for full record of the case. The greater number of applications, however, will come from the owners of small properties where two or three men are to operate the system, or where miners are not in a position to furnish a full description, either from want of knowledge or from want of means to hire suitable engineering advisors. These are cases where the output is small. In such cases the Commission expects to use its discretion as to the form and fullness of the applications. The inspection of all mines, however, is to be maintained.

As required by law the Commission, generally by a committee of its members, has in every case visited the locality of the application. Some of these journeys require five or six days of arduous travel in the mountains.

The number of applications for permission to mine has not been great. The system is a novelty and its workings are yet to be understood. The miner is in the hands of the Commission. He is uncertain whether his practical device for impounding will be understood, uncertain whether or not, even if all goes well with the Commission, he may be involved in litigation.

It is probable that the increased expenditures and restrictions upon the freedom of operations involved by the new system of regulations may act to make mining in many cases less profitable than formerly, thereby reducing the magnitude of the output and the number of applications.

Everywhere in mining territory where auriferous deposits were found of sufficient extent and so situated as to be accessible to the water supply, and at sufficient elevation above the rivers to give a fall to the sluices equal to carry off the detritus, monitors were put at work washing down hills and transferring them to the beds of adjacent streams down which they were moved by freshets to the plains and water courses of the valleys.

Public and private injuries then created in increasing degree gradually developed opposition among the valley people and gave rise to litigation which eventuated in the injunction of the Circuit Court in 1884, forbidding certain mines to use the beds of rivers and streams as a dumping ground for mining debris. This injunction remains in force.

In the course of this controversy, which lasted over a number of years, there grew up in Sacramento valley an organization entitled the Anti-Debris Association. This association has its attorneys and inspectors. The United States also appeared in its own course and asked for an injunction against parties charged with depositing mining debris, not only in the beds of navigable waters, but resulting to alleged injuries to navigation.

Two cases have been decided. These cases touch closely the operations of this Commission as defined by the act of March. The reasons assigned for refusing an injunction in the North Bloomfield Company and granting it in the other case, mark an important distinction between detritus impounded in the beds of streams subject to a freshet and tributary to navigable waters, and a storage reservoir site not traversed by natural courses.

Mining operations have disclosed the fact that deposits of auriferous gravel are in the beds of distant rivers lying on the western flanks of the Sierra Nevadas one or two thousand feet higher than the adjacent modern rivers. It is assumed that the existing rivers have cut through channels since the period during which ancient rivers became first filled and were then obliterated by an overflow of irruptive matter.

The excavation of these channels in past years by the hydraulic process has left large cavities now available for refilling with new detritus. These pits are admirable reservoir sites. No natural water course traverses them and the natural drainage is of little extent. To refill them is to restore them to a state of nature. If barriers to restrain are necessary they are only so during the process and operation of mining.

The barriers may afterwards decay, but the detritus remains impounded. This circumstance was recognized by the court in its refusal to enjoin the North Bloomfield Company and this the key to the situation.

Aside from these reservoir sites and other such natural sites as may fulfill equivalent conditions of safe storage, there remain for deposit the beds of natural water-courses. The storage here is not so favorable.

The gold-mining industry is important in its bearings upon the general interest of the United States as well as upon local prosperity, and the risk is so great that ill-advised restriction upon activities is to be carefully avoided.

On the other hand the great amount of material that has been handled and stored by hydraulic process to getalittle gold makes the problem of securing impoundment and of the protection of navigable waters and adjacent lands one of equal seriousness. Old tailings have been reworked without restrictions by the courts or opposition of the people of the valleys. This work does not come within the definition of hydraulic mining.

From the day of its organization the attention of the Commission has been fully occupied with matters relating to the resumption of hydraulic mining and to the individual duties of its members. During the coming session it is proposed to make such surveys and examinations as may appear necessary to fulfill the requirements of the law.

The balance on hand from the appropriation of March last of $15,000 for the expenses of the Commission is $13,828.44. It is estimated that the additional amount of $20,000 will be required to make the surveys and investigations required.

The restraining barrier at or near Deguerre Point on the Yuba river is considered an advisable construction to be soon undertaken for restraining all detritus now in the beds of streams in furtherance of the project for improving the Sacramento and Feather rivers. A suitable appropriation for this work will be $300,000.

The Commission is by act of Congress left very much at its own discretion, and is compelled to rely mainly upon its own judgments, being unprovided with a legal adviser, and is of necessity compelled to its own conclusions in deciding certain legal points.

A party presented an application in which he stated that he was the owner of mining property which he desired to mine. The attorney of the Anti-Debris Association controverted that the applicant was not the owner and offered to present proof that the property had been sold to another party by the United States Marshal and this party held the deed. The attorney urged that the Commission is required by act to take notice of this fact and refuse a permit for the reason that the law confers a permit to proprietors. On the other hand, the applicant was in possession of the property, and claimed to hold it by deed from the sheriff of Nevada county, who had sold the property to meet unpaid taxes. In view of all the conditions, the Commission decided upon a rule of action to the effect that the party in possession is, until the course of law shall have determined otherwise, considered and recognized as the owner.

AS TO THE SLUICING OF TAILINGS.

The report deals at length with the important question of sluicing tailings into the streams, and takes the stand that such sluicing does not come under the head of "hydraulic mining," as authoritatively defined. It will he remembered that in the famous legislative contest the following was the definition announced:

Hydraulic mining * * * is mining by means of the application of water under pressure through a nozzle against a natural bank.

On this important point the language of the Commissioners' report settles definitely the satisfactory latitude allowed to miners in the reworking of detritus. The report says:

The definition of hydraulic mining is mioing by water under pressure directed against a natural baok. It has also been mentioned that throughout the period of cootroversy old tailings have been reworked without restriction by the courts or opposition of the people of the valleys. This work does not come within the definition of hydraulic mining. No nozzle is used and the water is not used under pressure.

The tailings are shoveled into sluices and the gold is separated through the shifting agency of running water by the aid of riffles and amalgamation with quicksilver. The effect is to remove material from one place to a lower position.

The work has hitherto been confined to the beds of streams filled with tailings. The operation does what the freshets do—that is, it moves material down stream. There is no great objection to this process confined to beds of streams. Doubtless it disturbs and transports some finer matter which might never have been otherwise displaced, but this is of no great importance.

The case is somewhat different when applied to deposits impounded in beds of streams or elsewhere. It is quite practicable and, so far as is known, permissible under the law to work, by sluices, tailings which have been kept out of river beds by barrier or otherwise, and to deliver them reworked to the beds of streams in positions from which damage to navigable waters may result.

As the law stands, so far as the act of March 1, 1893 (the Caminetti act), is concerned, while the hydraulic miner is required to deposit his tailings securely, the sluice miner may perhaps in a legal manner remove the tailings from the reservoir without any obligation to restrain them in their new positions. Perhaps the scale of this work may be so small as to be unworthy of notice and perhaps if it should become important the courts would intervene by injunction.

Regarding the probable extent of hydraulic mining under the provisions of the Osminetti act, the commission says:

The commission has no means as yet of estimating the number of applications with which it will have to deal. In 1880 more than 400 hydraulic mines were reported to be in operation within the drainage area of the Sacramento and San Joaquin rivers.

The assessors of the mioing counties reported in 1880 over 10,000,000 inches of water used in mining. The State Engineer's estimate of the quantity of gravel mined in that year exceeded 38,000,000 cubic yards. The amount of workable gravel yet remaining is indeterminate. Competent authorities place it at several hundred million cubic yards.

It is not supposed that the commission will have to deal with all, or nearly all, of this great mass. But on the other hand it is not possible yet to estimate the percentages to come under our control. Much depends upon the working of the system of control during the coming year.

It is probable that increased expenditures and the restrictions upon freedom of operations involved by the new system of regulation may act to make mining in many cases less profitable than formerly, thereby reducing the magnitude of the output and the number of applications.

Cavities created in gravel beds in the high Sierras and their present availability for reservoir sites is a subject treated upon in the report. We quote:

It is true that these sites are not profitably available for storage in quantities at all approaching the contents as they were in a state of nature. Some of them may not be at all practicable sites for any great amount of storage. This is due to the fact that often there is not fall enough from the gravel to be mined to the level of the reservoir site. A fall of at least 100 feet to the mile is generally necessary, to enable the sluices to carry the detritus. Much more fall than this is used when available. The fall diminishes as the reservoir becomes filled. The limit of profitable mining may be reached before the best ground in the mine, that which is lowest is broken.

Under such circumstances the miner has a resource in elevating the gravel. This is done by using a large portion of water-power to raise the material to a higher level. It is practiced to some extent. It lessens very much the quantity that can be worked in a given time by a given water-power. Nevertheless, it has been used to lift to heights as great as 80 feet.

A second point worthy of attention in the decision of the North Bloomfield case relates to the condition of escaping water wasted after it has performed its full mining duty. The Court practically holds that if the sand and gravel be restrained it is not to be insisted that the residual water shall be clear, the evidence proving that the finely divided clay, which gives color to the water, is nowhere deposited in appreciable quantity.

Apart from these reservoir sites, and from such natural sites as may fulfill equivalent conditions of safe storage, there remain for deposits the beds of natural watercourses. Storage here is not so favorable. These streams are subject to freshets. They have falls of many feet to the mile. In some cases the streams in freshet may be termed torrents. Two cases may be distinguished: First, where the barriers are overtopped; and, second, where a separate channel is made.

PROBLEMS OF THE FUTURE.

Overfall barriers are subject to danger of destruction of violence of flood, and, if built in wood, sure to decay in a few years, so that sooner or later there comes a time when they no longer retain material deposited behind them.

Independently of these considerations, the equilibrium of a river bed of movable materials, over which unequal flowage occurs, a rivulet at one season and a torrent at another, cannot be regarded as constant under these different circumstances. There is probably no constant slope of equilibrium. It varies with the flowage.

While, therefore, a barrier placed across the bed of such a stream must restrain, it can hardly be said to restrain all, and perhaps not nearly all, deposits. The wider the bed the smaller the freshets, and the thinner the height of overfall the more effectually will the barrier restrain.

A modification, which passes the flowage in a separate channel and permits no overflow at the barrier, relieves the structure from the more imminent perils. Yet the watercourse passes over and through the reservoir, and while the barrier so long as not overtopped may be safe, yet uncertainty exists as to the efficacy of storage after a time, due to causes already mentioned. Moreover, mining ceases in time. The residuum remains. In what way is natural decay or particular damage to a restraining system to be repaired? If the stream have little or no natural drainage, the case is simpler. The gold-mining industry is important in its bearings upon the general interest of the United States, as well as upon local prosperity, and the risk is so great that ill-advised restriction upon activities is to be avoided. On the other hand, the great amount of material that has been handled and stored by hydraulic process to get a little gold makes the problem of securing impoundment and of the protection of navigable waters and adjacent lands of equal difficulty and seriousness.

Between these opposing and delicate conditions the Commission has to risk its way.

NEW MINING COMPANY.—Dr. W. C. Jones, Frank Dulmaine, D. B. Marwick, Adolph Dulmaine and Jas. P. Shoemaker are the directors of the Shoemaker Gold Mining Co., the new mining company organized near Grass Valley.

Advertise Your Mines.

TO THE EDITOR:—Mr. W. S. Chapman has an article in the PRESS of this week on the "Profits of Gold Mining," which is interesting enough, but not entirely convincing to those unfamiliar with his premises. Gold mining is profitable, of course, when you have a big ledge, a good grade of ore and plenty of money to avail yourself of your advantages. There is no disputing this conclusion; but I would like to know how often you find a mine with all the necessary conditions. We have heard a great deal from Mr. Chapman and others of late about the thousands of millions locked up in the Sierras, and the indifference of local capital in regard thereto. All I can say is, these thousands of millions are very coy toward the "caviare" and demonstrative in unfolding their charms only to a chosen few. The writer of these lines has been running all over the State for the past two years in search of a mine, and has not yet found one. Since January of the present year he alone has examined and experted 24 different properties and found only one of them suitable, and this he did not succeed in securing.

Fearing that Mr. Chapman may think I did not properly choose my territory, I will inform him that among the things looked into were two extensions—one north and one south—of the Taylor. They were both well opened with ledges from 20 to 100 feet in width and reputed to run from $4 to $10 per ton, but after most careful testing they actually went only from 50 to 75 cents. I am not alone in my general experience. I have a friend, a quiet gentleman from the East, who, in the past few years, has sunk $150,000 in the mines of this State without receiving any returns. He has also spent the better part of the present year in trying to find something, and, not succeeding, he is about to return to his Eastern home in disgust. There are at least half a dozen heavy men in this city who would take a good mine, but they will all tell you that they have spent years of time and barrels of money in hunting for such a thing to no purpose.

Mr. Johns, of the Sierra Buttes, has to my positive knowledge looked at scores of offerings in the last five years, and, after the most thorough sifting and winnowing, the very best thing that he got was a mine that does not produce above $10,000 a month gross with 30 stamps, or at the rate of $4 to $6 a ton; and this is regarded as so extraordinary it is one of the things thrown into your teeth when you venture to express a doubt as to the Golcondian quality of our mines.

Water will wear away a stone at last, and Mr. Johns, persistent and indefatigable as he is, has had so many disappointments, has been sent on so many fool's errands in recent times—going to look at things which were never as represented—that he has been compelled to post a notice in his office as follows: "No Mines Entertained Here." Examples of this sort could be multiplied *ad infinitum*, but enough has been said, perhaps, to prove that valuable mines are not so numerous nor capitalists to take them up so few as enthusiasts suppose. Mr. Phil Armour was no doubt impressed with this fact when, recently wanting $500,000 at a pinch, he applied for it in Europe where it could be obtained, instead of consuming half a lifetime in hunting for a mine like the Kennedy to give it to him. I am perfectly familiar with the Kennedy, and with every mine of prominence in the State, by personal inspection or otherwise, and, notwithstanding, all I can say is: If a man wants a pound of butter in a hurry, he will be wise to go to the corner grocery for it, instead of talking about waiting until the cow be milked and turning it out of a churn.

It is possible there may be some good mines in the State, but the trouble is for capitalists to discover where they are. These brokers in San Francisco who have charge of presenting properties are, as a class, utterly unreliable. How could it be otherwise? They receive notes and accounts of mines always at second-hand; they have never seen what they offer; they are mostly penniless and thereby incapable of verifying reports. It is marvelous what these people will often tell you. Not long since, I was sent by one of them to look at a mine with a ledge 15 feet wide, 500 tons on the dump going $18, with a series of other ledges, running from 4 to 8 feet, thrown in. I found the main ledge to be three feet wide, about 40 tons on the dump, instead of 500, the subsidiary ledges running from a streak to a few inches, and nothing assaying above $1 a ton. This case is typical of a hundred, and it must be allowed that unless the business of selling mines passes out of the hands of customers like these the industry is likely never to progress.

There is a way out of the difficulty if mine-owners would only adopt it, and that is to advertise their mines in some reliable paper—the MINING AND SCIENTIFIC PRESS for instance. This should not be done in isolated cases, but the owners of good properties everywhere should combine and engage one, two or three columns of the paper by the year, so that the expense would not be heavy on any one individual in particular. In this manner mines would be brought immediately to the attention of capitalists, and a way opened up for negotiation with the owners direct without the intermeddling of go-betweens and brokers.

For years I have not known of any mine which has been sold through the agency of these parties, and therefore the method I suggest would not in any event be likely to prove more disappointing than that now in vogue.

San Francisco, Nov. 25, 1893. "INVESTOR."

A Matter of Mutual Interest.

TO THE EDITOR:—Just a word for the mining exhibit of the Midwinter Fair. All miners should join in heartily with the circular sent out by the Mining Committee, and it seems to me all miners—actual miners—should contribute something to aid this exhibit. Some say, "Let the mine owners do it," that they make all the money, etc. I claim that the miner who works every day and gets his $2.50 to $3 and more, is directly interested, and more so than a mine owner, in the success of this grand display, where an opportunity is given to show up the wealth of our Golden State and make a fitting illustration of its golden resources, or what would be better, its mineral possessions. Let all miners give something; if not one day's pay, give what they can. It is not money thrown away. The managers are all good men and true and will see to it that all moneys are properly expended.

We never have had such an opportunity to "display our goods" in the history of California. Now let us embrace it. Let no jealousies mar the proceedings in any manner. Bring or send your gold, silver, copper, iron, tin, coal and all the rest of the articles that will come under mining, from San Diego to Del Norte and from the Golden Gate to Tahoe lake, and when we go to see it we may all say, as we point with pride to our mining exhibit, "I helped it all I could." Yours for success, J. R. TREGLOAN.

Amador City, Nov. 30, 1893.

From Ventura County.

TO THE EDITOR:—The Bunker Hill quartz vein is 30 feet wide, although gold is found for over 100 feet in width, but the true vein is less than that. The Frazier mine is working four or five men. Mr. Chilson is superintendent, and he has made a big strike in the mine several feet deeper than the mine has hitherto been prospected. The ore is rich and there is a big body of it. As the Frazier mine has been prospected deeper than any other mine in the district (over 300 feet), it is encouraging for others to go down on their claims.

Prospecting for placers is the go here, now. There is no boom and we do not want any, and this is no place for poor men to get work. E. H. Meyers from Ventura is here collecting specimens for the Midwinter Fair, and he has discovered a fine quartz lode which prospects well. I. H.

Piru Mining District.

The Colorado Silver League.

Geo. C. Merrick, in his call as president of the Colorado Silver League for the meeting at Denver on the 7th inst., says:

"The silver question has become a national question, to be carried into the elections of 1894 and 1896, and the work of education should be extended so as to reach every voter, especially in the great manufacturing States of the South and East. To do this, organization is essential. The situation now calls for such action by the State League as will unite and consolidate the sentiment in this State and sound the note for the campaign of 1894 and 1896.

"At this meeting of the league, officers for the ensuing year are to be elected, therefore it is important that every silver club in the State shall be represented, as this will be the most important meeting ever held in the State upon the silver question.

"No backward steps! No surrender! No faltering! No compromise! Until the money of the constitution—silver and gold, 16 to 1—is restored to the people, and the sovereign power exercised, under constitutional limitations, as provided by the fathers of the republic."

Some Large Figures.

The Director of the Mint in his annual report says the value of the gold deposited during the year was $50,000,000. Silver deposits amounted to 73,000,000 ounces. The export of gold was $108,000,000; imports of silver, 42,000,000 ounces. The amount of silver offered for sale to the Government was 98,487,890 ounces; amount purchased, 54,000,000 ounces; average price paid, .843.

The total amount of silver purchased under the Sherman act up to November 1st was 168,674,682 ounces; average price, .9224; coining value, $218,048,431. Silver bullion on hand November 15th, 130,494,825 ounces; total amount purchased since April, 1873, 496,984,894 ounces, costing $508,933,975.

The stock of gold in the United States July 1, 1893, was $597,000,000; silver, $615,000,000. The gold coinage throughout the world during 1892 was $168,000,000; silver, $143,000,000.

C. H. Aaron's Death.

Elsewhere editorial reference is made to the sad death of Mr. C. H. Aaron, so long and honorably connected with this paper—a man who stood high in the science of mining and metallurgy.

The following, which will be read with interest by those who knew him and knew of him, is from the S. F. *Examiner* of the 6th inst.:

From the remote effects of a blow from the sandbag of a highway robber, the last of the three miners and metallurgists of this State who have written standard works upon the subjects of which they have made special study died on Monday. On the evening of the 4th of November, Charles H. Aaron, a man known to all the miners of this coast, was attacked by a robber and beaten with a sandbag. Before that time he had noticed indications of incipient locomotor ataxia. The blow on the head seemed to excite this disease and his ill health made him despondent. On Thanksgiving Day, Mr. Aaron fell down a flight of eight steps, and, striking his head on the stone pavement, fractured the skull. From this injury he died at the German Hospital on Monday afternoon.

Mr. Aaron was born in Birmingham, England. When a young man he made a couple of voyages to sea and then came out to California, where he arrived in 1852. He was one of those to form the famous Walker filibustering expedition in 1853, but soon became disgusted with the party and its purpose.

Then he went to mining. While in Montana about 1864 or 1865 he wrote to his brother in Marysville for funds to help him continue his prospecting. His brother, who was an assayer, wrote that it would be best for him to come to Marysville and learn the assaying business. This he did, and it was his first start in a business that he made a success of. He studied chemical metallurgy, and particularly gave his attention to silver ores.

He was always interested in the "wet processes," and wrote largely on chlorination and lixiviation. Of late he has given much attention to the cyanide or MacArthur-Forrest process for the working of gold ores. Mr. Aaron had large experience as an expert millman, in which his intimate knowledge of chemistry greatly aided him. In the pursuit of his profession he has been in Guatemala, Honduras and other parts of Central America. His last work was in Honduras, from which place he came back in poor health.

Mr. Aaron has written several books on assaying and metallurgy, all of them of a popular character. That on "Testing and Working Ores" was intended for miners who had no chemical knowledge. His writings were all plain and simple, and he possessed the faculty of stating his point so it could always be clearly understood.

In addition to his books he has been a frequent contributor to the MINING AND SCIENTIFIC PRESS of this city and the *Engineering and Mining Journal* of New York. An article by him on the milling of gold ores, based on his observation and experience in California, and published in the latter paper August 10, 1889, was republished in the Reports of the last census as an epitome of that subject. Most of Mr. Aaron's writings have been on chemical metallurgy, but he wrote frequently on miscellaneous subjects, and possessed a sense of humor which always made his writings agreeable even with a "dry subject." He has written and published more books and articles than any other metallurgist on this coast. He was considered an authority on the milling of gold and silver ores. Mr. Aaron never had much education in schools, but was always a student, and when he hunted for a thing was very apt to find it.

Among his publications in book form were "Assaying" and "Aaron's Leaching Gold and Silver Ores."

Kustel, Phillips and Aaron were the three Californians who wrote of these subjects and Aaron is the last to die.

THE sea serpent has been seen again, this time, according to yesterday's dispatches, by F. O. Peters, of the steamship American, in north latitude 43° 55′, west longitude 56°. The sea serpent story is a little late this year. It was due the week before Thanksgiving. All these yarns are behind time this year. The woman who found coarse grain gold in the crop of the chicken she was dressing for dinner has not been heard from yet, though the occurrence should have been wired by October 30th. The 86-year-old man who chops half a cord of wood before breakfast and cracks hard-shelled nuts with his teeth lags on the way. The woman who danced pirouettes and flourishes all the evening at a family party and then went home and bad twins, and the old lady who, though not wearing spectacles, has just completed a quilt with 81,647 pieces in it, are away behind schedule time. Usually these stories appear annually between September 1 and December 1, and their tardiness this year is another instance of the far-reaching financial sluggishness.

THE State Board of Fish Commissioners has issued a handy pocket-size pamphlet of 140 pages, containing the fish and game laws of California as prepared by the attorney for the board, F. P. Deering. It contains the general law on the subject and all ordinances adopted by county Boards of Supervisors. It should be in the hands of all who have interest in the game resources of the State. As it is a public document, we presume a copy can be had free on application to the secretary of the board, W. C. Murdock, 33 Chronicle Building, San Francisco.

THE secretary of the Montana Mining Co. states that the total output for October was: Gold, 1580 ozs.; silver, 14,960 ozs.; and that the estimated realizable value of the same was $41,100. The tonnage of ore milled during the month was 5568 tons, 90 stamps having been in operation. The expenditure was as follows: Working expenses on revenue account, $33,600; outlay on shafts and developments, $6200; extraneous expenses (including insurance for month), $1566; legal expenses, $500; expenses on capital account (on tailing dams, etc.), $100—$8366; total, $41,966.

An Interesting Discussion.

TO THE EDITOR:—Referring to your extract from *Popular Science Monthly* appearing in MINING AND SCIENTIFIC PRESS of Nov. 11th, containing an alleged assertion of Laplace that he could improve on the present system of celestial illumination by a simple change in the moon's distance and velocity, perhaps a few further remarks would not be without interest. I should premise that I can scarcely credit the statement that so distinguished a scientist as Laplace could make so absurd a blunder, and should feel thankful for a precise reference, by page and paragraph, to the work of his in which the quoted words occur. Permit me to add that, as there are doubtless many mathematicians, physicists and astronomers on the coast and elsewhere who are readers of your paper, I invite their criticism of the following necessarily brief discussion:

In the first place, as light varies inversely as the square of the distance, and, as the moon is now at only about 1-400 of the sun's distance, the removal to 1-100, by which Laplace proposes to improve its illuminating powers, would involve, from increase of distance alone, a diminution of its light in the ratio of 16 to 1.

In the second place, Laplace asserts that the moon, in that position, could not be eclipsed, when the fact is that orb, in the position designated, would be in a state of perpetual partial eclipse. It would certainly be beyond the apex of the cone of the earth's darkest shadows, the region of full eclipse; but the earth at that distance would still intercept from the moon the direct rays from nearly half the sun's surface, which could only reach it by being refracted in passing through the earth's atmosphere. Just how far these refracted rays would help the illumination may be judged from the fact that they reach the moon in the same manner, under present circumstances, when totally eclipsed, with merely the effect of rendering her disc visible.

It would thus appear that, according to laws of light, some 25 or 30 of Laplace's moons would be required to give as much light as our solitary moon does at the full—rather a waste of material in face of the fact that, with a second moon placed in opposition to the present to revolve in the same orbit, we could have an equal quantity of light all the year round.

It is not for me to enter on questions, of which I at least am ignorant, as to how much of that transformed light the human race could enjoy without injury; but that it has a powerful physical effect on the optic nerve, for instance, is generally believed. The considerations also relating to tides, the attraction which now causes them being, in the proposed system, diminished in a still greater ratio than light, I will pass by; nor is it worth while to more than comment on the disingenuous suggestion that believers in design must admit the moon's failure because it does not give equal light or more light or less light, as no intelligent person doubts that the moon gives all the light it was ever designed to give, while he can reasonably contend that whoever put the moon in place, and subjected it to laws, resulting in stable orbit amid perpetual motion under the most complicated circumstances, could and did give us all the light and all the darkness he thought proper.

Waiving further notice of these issues, I beg to proceed to a brief discussion of the mathematical plans of the question:

1. Is the moon's permanence in the assumed orbit a physical possibility?

2. Possibility being admitted, is Laplace competent to calculate the exact conditions which will ensure equilibrium?

There is a problem of extreme difficulty, well known to mathematicians, called the "Problem of the Three Bodies," which requires the curves three bodies will describe through their interaction under the laws of gravitation. The general solution of this problem has never been accomplished, while that under discussion involves far more complicated combinations. A simple statement of the facts will show that Laplace was not competent to give the data necessary to calculate the conditions which should ensure the permanence of such a system.

Let us suppose there were only the three bodies—the sun, earth and moon—in the universe; in that case, any intelligent schoolboy with a knowledge of the laws of gravitation might readily calculate the position and velocity required for equilibrium in the proposed orbit; and, in their solitary universe, the three would maintain their respective positions for all time. The position of the moon, however, would be one of unstable equilibrium, similar to a globe balanced with its surface on a needle's point, so that, in case of unbalanced disturbance, its effect instead of being rectified will be aggravated and hopelessly perpetuated in ever-increasing ratio by the central forces. Let us suppose an infinitesimal disturbance, caused by the moon's gravitation to the earth, being diminished the amount due to the difference of the attraction, on each, of one of the planets. The moon at once increases her distance; this reacts on the gravitation, still further decreasing it. The moon's angular velocity is also lessened, so that she begins to drop behind the earth; the sun and earth no longer pull together, but at an angle by which still more force is lost. These reactions go on increasing until the moon's proposed orbit is completely changed, and she parts company with the earth forever. This, of course, is on the supposition that a second disturbance or, rather, a cycle of disturbance—for they never cease—did not occur just at the right time, of the exact force necessary to restore equilibrium or throw the moon just so much too far, as might be needed for other cycles of changing attraction to all eternity.

To balance the effects of these constantly varying disturbances, absolutely necessary as it is, owing to the inherent unstability of the system, to ensure permanence, is entirely beyond the reach of human knowledge and human calculation. The changes are constantly varying according, in each case, to a multitude of interacting laws which make the minutest portion an object of the utmost complexity; and the full solution of the problem should make that of "the three bodies" appear a mere boy's exercise, yet the latter remains unsolved.

When, therefore, to the sources of disturbance already specified, we add the unknown amount produced by impact of meteors, etc., it is plain that human calculation cannot reach the problem, while it may very well be that permanence is wholly incompatible with the system.

It may be urged that the same difficulties beset any system, so that a more direct comparison of systems may be satisfactory.

With a single center, as at present, a wide range of disturbance is balanced by means of the inherent properties of the system—a decrease of distance, for instance, by an increase of velocity and centrifugal force, while a deviation toward the center in tangential direction causes an amount of diminution in distance which bears but a small ratio to the entire distance from the center, where the source of attraction is situated. In Laplace's system any decrease of distance is, in its effects on attractive force, equivalent to a decrease of about four times the amount with a single center, while there is no corresponding increase of velocity possible; and a deviation toward the center, in tangential direction, bears in its results a ratio to the distance between the moon and one center of attraction 100 times as great as it would if the whole source of attraction were at the geometrical center, so that a disturbance which would cause no serious change in the latter case, would in the former oblige the moon to pass through the earth's orbit within the 44th part of a revolution, a deviation of a little above 8° being tangent to that orbit. It does not, therefore, seem to be a desirable, even if it were a possible or an otherwise advantageous system. The comparison of Laplace with Newton, instituted by the writer of the article referred to, seems, from its tone, to imply that Laplace is at least as good an authority on such subjects as Newton. But mathematicians take nothing in their science on authority; they want the figures and the discussion. If Laplace could have solved, as he pretended, the problem referred to, the still unsolved "Problem of the Three Bodies" should have presented no difficulty. Newton, by his system of Fluxions, and, by a strange coincidence, independently of him, and simultaneously, Leibnitz, by his system of Calculus, revolutionized mathematical science and laid the foundation for modern mechanical progress. If their intellectual equals have since appeared on earth they certainly have given no adequate proof of it; and to liken Laplace to Newton, on the evidence, is like equalizing a good engine runner with Watt or Stephenson. The equality, in each case, may be a metaphysical possibility; but there is no better proof of it than I have yet seen for the permanence of the orbit of Laplace's obnubilated moon. D. S.

Austin, Nev., Nov. 28, 1893.

Oregon's Mining Exhibit.

Commissioner Ayers writes as follows in regard to the result of Oregon's mineral exhibit at Chicago:

A mining man was more at home among the piles of ore in the Oregon exhibit than among the mahogany and glass-covered showcases of the others, where he could only look at the beautiful specimens, but was not at liberty to examine them. Ours were there for inspection and examination, while the superintendents were on hand to explain their different characteristics and composition, together with a description of the mine from whence they were taken. In fact, we were here to try to induce people to come to Oregon and not to show to great hordes of sight-seers something to please their eye for the moment, only to be forgotten before they were ten steps away. Our simple and inexpensive methods will bring just as great returns. All our fixtures were made in Oregon, of Oregon material and by Oregon mechanics, so that all the benefits possible to be derived from the expenditure was enjoyed at home.

A number of our mines represented have received awards. Oregon stands at the head with her great nickel mine at Riddle, it having received the high award and medal over even the great New Caledonia nickel mine, as producing the finest grade of silicate of nickel. This fact alone is worth to Oregon all the entire cost of the exhibit. Small pieces of the ore were anxiously sought by the visitors as mementoes. Our Oregon marble also received special recognition and an award. The little placer mine has proved itself a drawing card, as well as an instructive lesson to many. It was crowded from morning till night by people anxious to see how gold is washed from the dirt. It also got away with a gold medal.

And so it goes. What would have been the result had we only had six months instead of six weeks in which to make up an exhibit, and the pleasant, agreeable weather of summer to do it in instead of the cold and stormy winter? This was the one great opportunity of a lifetime, and now that it is over how easily is all this to be seen. The amount of money spent by the commission in making our display in all the different departments will return to the State tenfold.

The familiar faces of numerous Oregonians were to be seen daily, and the registers of each of the departments are well filled with their names. On my register there are 1395 names of Oregonians that have called, singly and in numbers, from the opening of the fair until the close. In the horticultural department there are still more. Oregon is "in it." C. W. AYERS,

Mining Commissioner for Oregon.

A New Hot Blast Copper Furnace.

An improvement recently placed on the water-jacket furnaces of the Old Dominion Copper Co., at Globe, Arizona, consists of an arrangement for heating the blast before it enters the furnace, and as it has been so eminently successful in its work, a correspondent of the *Silver Belt* describes it in detail, first giving the construction and afterward showing what effect it has had on the working of the furnaces, and in what ways it has effected a saving of time and a reduction of the running expenses.

The improvement is of the simplest kind, consisting of a wind-jacket completely surrounding the crucible of the furnace, and being in connection with the blast supply pipe and also with the regular wind-box. In operation the blast coming from the supply pipe enters the wind-jacket in the usual cool condition, slightly higher than the surrounding atmosphere, and passes completely around the crucible, here coming in contact throughout its passage with the hottest portion of the furnace. After making the circuit of the crucible it flows into the regular wind-box, and thence to the tuyeres in the regular fashion. In making this passage it serves several purposes:

1st. It heats the blast to a high degree by taking up the heat which has formerly been lost to such a large extent by radiation, now taking it back into the furnace to perform useful work by reducing the coke consumption.

2d. It keeps the crucible from getting abnormally hot, thereby saving wear and tear caused by great variations of temperature, and saving the time which was formerly lost in cooling it down when it got in this highly heated condition.

3d. Making it very much cooler and more comfortable for those working in the vicinity of the furnace.

When one of these new wind-jackets was first placed in operation by this company they ran a comparative test of this furnace and one which was exactly similar except that it had not the wind-jacket, both being 42-inch furnaces of the ordinary type. The test was very successful and showed that the jacket effected a saving of five pounds of coke in every charge of 600 pounds of ore. In this furnace the temperature of the blast is raised 55°, as has been determined by many readings taken just before entering and leaving the jacket.

A jacket was shortly afterward placed around the crucible of a second furnace, and by slightly modifying the design it has been made even more successful than the first one, as the temperature of the blast in this case is raised 83.5° in its passage, and the furnace is now running on one pound less coke per charge than the first one, or six pounds less with the jacket than without. As stated above, there is increased economy by saving the time which was formerly lost by having to cool down the crucible when it became abnormally hot, thereby allowing more ore to be smelted at the same cost for labor and fixed charges.

The Old Dominion Copper Co. are now using two of these jackets, one of which has been in use for two months, and they are now putting one on their third furnace, so well are they pleased with it.

The wind-jacket is the invention of Mr. Louis B. Walker and Mr. John Murphy, who have applied for letters patent on it, and hope to get it established in some of the other smelting plants of Arizona, as they consider that the high price of coke in the Territory will demand its adoption.

Southern Plumas and Northern Sierra.

[Abridged from the Plumas *National-Bulletin*.]

Gibsonville, one of the historic mining towns of California, is hut a short distance beyond the southern boundary of Plumas.

The Taber Mine is but a short distance below Gibsonville. Nearly 25 years ago Horace Taber began driving a tunnel into the Gibsonville ridge for the purpose of tapping an ancient gravel channel, breaks from which he thought supplied much of the gold in the vicinity of Gibsonville. During all these years, as circumstances would permit, he labored to accomplish the result aimed at. It has cost him about $50,000 up to the present time. The tunnel is now in 2640 feet. The first 150 feet is timbered, 1300 feet through a lava cap, next 130 feet through pipe-clay, then 500 feet through bedrock, and the remainder of the distance through hard blasting rock. Mr. Taber expects to reach gravel within 50 feet beyond the present face of the tunnel, which is 600 feet below the surface. He owns a mile of the channel lying immediately above the property being successfully worked by the Thistle Shaft Company; also 500 feet of ground along the bed of the ravine below the mouth of this tunnel. That Mr. Taber's fondest hopes will soon be realized, if he continues to push his tunnel ahead, seems not to admit of a doubt.

Just below his property the Thistle shaft people are extracting rich gravel from a large channel. The gravel is hoisted over 500 feet through a shaft, stored and washed. Of necessity this method of working the mine is expensive, yet of such richness is the gravel extracted from the great channel that it pays well. This operation demonstrates beyond any doubt that for miles under the Gibsonville ridge exists an ancient auriferous channel, the development of which by the proper use of capital will cause an era of prosperity in that section important alike to Plumas and Sierra counties. Of the Thistle shaft enterprise, C. B. Wingate, a young man of ability, energy and enterprise, is superintendent, and Aug. Holtz is the foreman. At present, owing to a scarcity of water for gravel-washing purposes, only about 40 men are employed. Later on, probably 75 to 150 men will he kept busy in and about the mine.

La Porte is prepared for winter. At the present time the old mining town is quiet, but during the past summer times were livelier than for years past owing to the inauguration of new mining enterprises and a revival of old ones. This town is the center of a large and very important mining region, one which, even in what are called quiet times, annually produces an amount of gold rising to respectable proportions. However, old citizens like Hon. B. W. Barnes tell of the booming times in the town's early history when its population was large, miners crowding the streets and plenty of gold in every man's pocket.

Wm. S. Schuld and Chas. W. Hendell, two mining and civil engineers, reside at La Porte and do much work in their profession in Plumas and Sierra counties. Both men are largely interested in mines.

Hendell & Packer Mine.—On Slate creek, hut a short distance above the road between La Porte and Port Wine, is a large river-bed placer mine owned by C. W. Hendell, Packer & Son. It consists of both virgin ground and tailings which, during the past 40 years, have been washed into this river gorge from the enormously rich hydraulic mines above. These gentlemen have an undisputed claim to about three miles of this channel. Being successfully operated in this mine is a new and important invention by Mr. Packer and his son. It consists of a hydraulic pipe which delivers, under pressure, water against a wheel similar to the Pelton; of the necessary shafting, to which is attached a pulley over which passes a double endless chain about 12 inches apart, links about ten inches long and toggled together. Between the two chains and eight feet apart, by means of bolts, are attached gravel buckets. The length of this gravel carrier depends upon circumstances. The one in operation was about 100 feet long, the lower end extending down into the mine. While it was running, 20 men were standing on either side shoveling gravel into the buckets, which carried it up to the wheel, and, as the buckets passed over the pulley, the gravel was dumped into a sluice-box, down which the water discharged from the wheel washed the debris, piling it up in the shape of a big levee entirely out of the way. In working gravel that will pay for shoveling, it is a complete success—far superior to the ordinary sluicing process. By this method of working the mine is paying well. Next year the owners will have two machines at work and will operate on a large scale.

The Slate Creek Mine.—Immediately above the mine just referred to is that owned by a syndicate of capitalists and managed by Mr. Boyle. During the past season a flume five feet wide and about four miles long has been completed. It is designed to take up the waters of Slate creek, thus permitting the company, by the use of hydraulic mining elevators, to work the tailings deposited in the canyon in years gone by. These are supposed to contain a large amount of gold; indeed, we understand that they have been prospected and found to be rich. In the working of hydraulic mines doubtless much auriferous cement found its way into the canyon. Gold was swept through the sluices and carried to the bed of Slate creek. The company propose to handle this gravel on a large scale. It promises to be one of the biggest gravel-mining propositions in the State, employing lots of men, expending large sums of money and securing big profits.

Port Wine.—This name is significant. It is related that in early times some parties were transporting a keg of port wine. Letting it fall, a hole was knocked in it. Finding it impossible to stop the leak, they drank heavily of the wasting wine, and with the usual result. To the locality was given the name "Port Wine."

The Pioneer Mine.—About a mile north of Port Wine is the once noted Pioneer mine, operated many years ago, both as a drift and a hydraulic proposition. Col. Baker took out of it large sums of money, as did other parties, approximately $400,000 being realized in all. It was enjoined, ceased operation, and about a year ago was purchased of the late Alexander Montgomery by C. S. Diesen and Judge Cowdery, of San Francisco. During the past year the owners have spent much money in fitting up the property, and in opening tunnels and gangways. They are now drifting south in good pay gravel, which they have been extracting during the past three months. At the end of the tunnel is a 140-foot incline, at the head of which is stationed a 12-horse power gasoline engine. It does the pumping and hoists all the gravel, using ten gallons of gasoline per day, which costs 23 cents per gallon. Mr. Diesen is the superintendent. He has the mine equipped in a most complete and substantial manner. About 40 men are now employed. It is probable that a much larger number will be employed next year.

St. Louis.—Near St. Louis is a drift mine, owned by C. W. Hendell and associates. They have about 30 men employed in development and other work, but as we did not visit the property, no extended reference will be made to it at this time. The town of St. Louis possesses to-day hut little indication of what it used to be, except the evidence of an enormous amount of mining in early days. The village numbering less than 50 people once cast 600 votes.

The Copper Syndicate.

There are the most powerful influences at work in copper, and within a short time the fact will be more generally appreciated than it now is, says the Boston Daily *Advertiser*. The greatest syndicate ever organized is now in full operation. It not only has bankers and capitalists in it of enormous wealth, with Baron Hirsch at the head of them, but included are contracts of enormous magnitude with the French and Russian War Departments, which are preparing for war upon an unprecedented scale. Millions of new guns are now being made for the Russian and French armies, and, when war is declared, millions of pounds of American copper will be stored in Russia and France to be used in the manufacture of cartridges. Russia and France will now use only American copper in their cartridges.

France has, for some years, used only American copper, having by special scientific commission proved that it is the only safe and sure metal to use, and Russia has now come to the same conclusion and will henceforth use only American copper for the cartridges of its army. These are not rumors, but are extraordinary facts. The great copper syndicate is operating with marvelous rapidity. It is only a few months now since they organized, and since July 1st the shipments of American copper have amounted to over 92,113,000 pounds, or a total of 276,339,000 pounds per annum, or a much larger quantity of copper than is produced by all the copper mines here. Let us try to realize the marvelous rapidity of this syndicate in its operations thus far. For the fiscal year ending June 30, 1893, the exports from America were 37,642,000 pounds, against 56,453,000 pounds for the fiscal year ending June 30, 1892, showing a decrease of 18,811,000 pounds up to June 30th of this year. But here comes this startling fact that for the two fiscal years referred to the exports foot up 94,095,000 pounds, while for four months, since July 1st, the exports are within 2,000,000 pounds (or 92,113,000 pounds) of the total exports for these two years!

The syndicate is still buying and must continue to do so, for my information is that their government contracts and their own individual purchases are to foot up 250,000 tons. Cut this down one-half and there is an enormous quantity to buy. These purchases mean that American copper must go higher—that 11, 12 and 13 cents will be reached within three months in short order, and that higher prices than at any time since the French syndicate days are inevitable. When lake copper sells at 15 cents, some of your readers may recall this letter and the valuable hints it threw out.

Mining at the Midwinter Fair.

One of the features of the mining exhibit at the Midwinter Fair will be a great gold column, designed by Superintendent Benjamin, showing the volume of California's $13,000,000,000 gold output. The obelisk will be 77 feet high with a 10-foot base. Other designs are also being prepared for an immense ingot or other columnar forms. Whatever design is selected will be gilded to impress the eye of the beholder at a glance with California's enormous gold output, and in order to make comparisons there will be representations of the bulk of $1,000,000 in minted and unminted gold.

There probably will also be cubical representations of the output of some of the years, showing the decrease caused by the shutting down of hydraulic mining.

The main entrance to California's mining exhibit and one of its most attractive features will be the grand arch and facade of onyx, marble and other California building stones which formed such a notable feature of California's mining exhibit at Chicago. The dimensions and beauty are such as to attract and hold the attention of all visitors and invite them to examine further into the great exhibit. It has an extreme height of 20 feet and a base line of 37 feet. The quarrymen and terra-cotta manufacturers are to be invited to construct from their marble, onyx, terra cotta, tiles and decorative building stones the inclosure for the mining exhibit. Apart from the grand facade there will be 673 linear feet of this inclosing parapet, which will give plenty of opportunity for a comprehensive display of all the mineral products of the State applied to building and decoration.

Amador county has applied to the Executive Committee for 1000 feet of space, and Nevada county for 2000 feet. Calaveras county is arranging an exhibit of copper and iron ores as well as its gold, and asks for all the space possible, and Butte insists upon 400 feet.

Nevada's Day, says the *Examiner*, will be one of the most interesting of the special occasions, and big excursions will then be run from the neighboring State. And Nevada's mining camp will be one of the features of the exposition. It started from Sam Davis' idea of the reproduction of an old frontier newspaper in a characteristic frontier newspaper office. From that has developed one of the most elaborate exhibits that will be made. The Nevada State building will be located close at hand, so that those who are interested in the exhibit from that State will only need to take another step to be in the old-fashioned camp, and there will be seen things just as they saw them in the "good old days" when the tavern, the dancehall, the blacksmith shop and the gambling layout were on the front and only street, with the flumes and the mining tunnel just a few yards away. This '49 mining camp company is in communication with parties all over this State and Nevada in the hope of securing all sorts of early-day relics, for which the buildings of this camp are to be a repository. It is their intention to make the camp a perfect museum which will be of particular interest to people from foreign places, and which will recall to the pioneers the days of long ago. The drawings and specifications for their "Rest for the Weary" hotel are ready for the contractors; also the framework on which Mount Shasta is to be erected, for the famous mountain is to be reproduced with mining tunnels at its base, and with mining operations going on all around it.

Senator Perkins has given for this camp the old cabin he lived in during his early days in Butte county. There will be a six-horse stage coach, with a history of exciting incidents, and the band of Sierra Nevada Indians, who in the early days harassed the miners and emigrants, will smoke the pipe of peace with their erstwhile enemies in camp at the foot of the Shasta model.

Amodor county has sent in a communication stating that a notable county exhibit will be made of its ores, minerals and mining methods, and asking to be allotted all the space possible.

Shasta will require at least 300 feet of space and can easily use more.

Mono county is already arranging its mining exhibit. Though the County Supervisors neglected to make an appropriation to help on the work, the County Commissioners are pushing ahead. One of the great features will be a slab of onyx and travertine weighing 4½ tons. This is from a recently discovered deposit. In addition to this, there will be cubes or ingots representing the county's mineral output, 500 to 1000 pounds of representative ore from each of the principal mines, unique specimens from different districts, views of mines and mining works, and some of the weird curiosities from the Mono lake country.

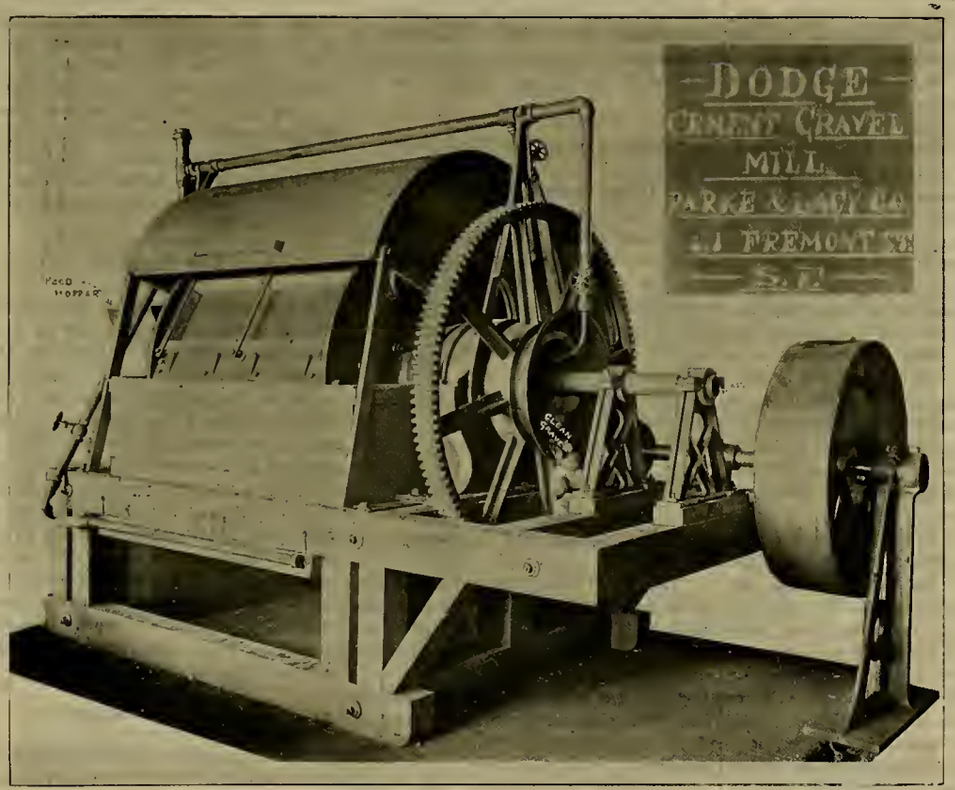
Coal and copper ore will constitute the chief features of Mendocino county's mineral display. Kern county is preparing to send up a lot of the gold-bearing gravel from the Mojave desert and have it worked by a dry-washing

machine to illustrate this branch of the mining industry. The county will also make an extensive exhibit of gold ores, asphaltum and its varnishes, oil and sulphur, green and gray sandstone, building granite and marble.

The work of raising $25,000 for the exhibit is progressing. The Utica mines, of Calaveras county, have headed the list with $1,000. The Kennedy Mining and Milling Company has given $500. This Amador county mine has been turning out $50,000 in dividends every month for some time. W. W. Stow, who owns the Gold Bank mine of Forbestown, Butte county, has given $250. The Bank of California's subscription is $250, and other banks have promised to be equally liberal. Other subscriptions are as follows: Sierra Buttes Mining Company, $100; Miller, Sloss & Scott, $100; Huntington, Hopkins & Co., $100; D. H. Burns, $100; John A. Roebling Sons & Co., $50; Washburn & Moen Manufacturing Company, $50; California Wire Works, $50; Thomas Flint Jr., $50. Martin Jones, one of the members of the finance committee, has reported that he has $325 on his books in addition to these subscriptions. Both the Selby Smelting and Lead Company and the San Francisco Stock and Exchange Board have promised to subscribe liberally.

A New Gravel Mill.

Many of the old river beds of California are rich in what is termed "cemented gravel," which consists of large barren



boulders of quartz, diorite or porphyry which have been cemented together by alluvial deposits that are rich in gold. To separate the cementing material from the barren boulders or gravel has not been easy of accomplishment. The stamp-mill has been largely used for crushing this material, but a proportion of small boulders and rock cannot avoid being crushed. Another method used is to sluice the material, and, by successive drops in the sluices, a part of the "cement" is rubbed off the boulders. This, however, is crude and not to be depended on, as cemented gravel will be carried a long way in water before the cement is disintegrated.

The "Dodge gravel mill" is a modification of the "Dodge" pulverizer, the main difference being that the opening in the journal opposite the feed end is made much larger than the feed opening, but concentric with it. Obviously, when the machine is filled up to the periphery of the feed opening, the boulders will drop out at the other end into cars, and in travelling the length of the machine (four feet) the cement is crushed and washed off the gravel and passes through the screens. The gravel being very hard, aids in the crushing as it is thrown around in the revolving cylinder. The pulp which passes through the screens of the mill goes through a coarse gold trap, where the coarser particles of gold are saved without the use of quicksilver, after which it flows over the silver-plated copper plates, terminating in a quicksilver trap, which saves all the quicksilver or amalgam that may drain off the plates. As all the amalgamation takes place outside of the mill, there is no loss by flouring of quicksilver. It is claimed by the makers that the capacity of this mill will be fully five times greater than that of a ten-stamp mill on the same cemented gravel, and that the wear and tear and power required will be correspondingly less, due to the barren gravel itself not being crushed.

The Raber Machine at Work.

The Raber flour-gold saving device has been put in operation on the Snake, and has, it appears, demonstrated its value. The editor of the Caldwell *Tribune* visited the scene of operations, and thus reports his findings:

The machine is not a machine at all. It has none of the characteristics usually understood when speaking of machinery, as will be seen from the description. The ground being worked, as before stated, is on Mr. Paul's premises on the bank of Snake river, near the first Snake river bridge below Caldwell. A threshing-machine traction engine is used for generating power which runs a small dynamo. From the dynamo an electric current of about three amperes is conducted to the amalgamator or gold-saving apparatus. The gravel from the river bar is scraped on a dump and shoveled into a sluice or flume which has a perforated bottom, called by miners a grizzly, into which a small stream of water flows. The fine sand, gold and water pass through the grizzly, while the coarser pebbles are raked off and carried down a shoot which holds a larger stream of water. After the fine sand, etc., passes through the grizzly it is carried through a flume over the amalgamator, which opens out fan shaped and has a number of wooden checks, which serve to spread out the water to a depth of about one-eighth of an inch. The water, sand and gold then flow over a copper plate and drop into a little trough, about four inches deep, in which is contained the sensitized mercury, or quicksilver. The little troughs are fitted with check gates which cause the water, after falling into them and before escaping, to peform a sort of rotary or churning motion. The copper plates, arranged like ordinary stair steps, are about 14 inches wide and five feet long, and there are five of them. The water, sand, etc., being spread out before reaching the first plate, flow over it and drop into the trough and are brought into contact with the mercury. This is repeated five times, and evidently every particle of matter contained in the water must come in contact with the chemicals deposited in troughs. The chemical used is, of course, the inventor's secret, but he does not hesitate to say that sodium in some form is the basis. No doubt electricity also plays an important part in the operation.

The practical workings of the apparatus seem to be extremely simple. In order to test its efficacy, gentlemen who were present washed a number of pans of the gravel taken directly from the river bar, each of which showed gold in more or less quantity, but after repeated washing of the sand which had passed through the amalgamator, no trace of gold was found, except in one instance where a single color was seen; but, as the same pan had been used for washing bar gravel, it is supposable that a particle of gold had adhered to the pan. We took occasion to calculate the amount of gravel that could be handled, and by actual timing it was shown that about 200 pounds per minute was a conservative estimate. This would amount to six tons per hour, or 60 tons per day of ten hours. Under favorable conditions, four men could easily operate the machine, and other expenses, including royalty, should not exceed $5 per day, making a total running expense of $17 per day. The plant will probably cost, put in operation, about $1000 where each machine is operated independently. But this cost can be greatly reduced where electricity can be furnished from a central station. It is estimated that the gravel will pay about $1 to the ton, but it would seem that at 75 cents, or even 50 cents, it could be worked profitably. However, the main questions for consideration at present are: First, is the gold in the sand? Second, will the apparatus save it? And third, is it practicable? To the first there is but one answer—the gold is unquestionably there; to the second, there is gold in the sand before it enters the machine, but there is none in it when it comes out—the gold must be saved; to the third, every appearance is favorable. Mr. Raber, the inventor, informed us that the cost of the chemicals would not exceed ten cents per day. Now with respect to terms of procuring machines: As we understand it, no machines will be sold outright, but the first cost for putting up will be between $400 and $500, and thereafter $1 per day royalty must be paid. These figures do not include cost of power and dynamo. At present the company have no machines amalgamators rather, to dispose of, as those on hand have already been taken. Ten of them will be placed between Lannan's Spur and Caldwell during the coming winter.

Utilization of Water Power by Electricity.

In a paper read at the recent meeting of the British Association for the Advancement of Science, by Mr. A. B. Snell, it was said that with coal at the average price of the last ten years, it is not probable that water power will prove much cheaper when the capital invested, cost of maintenance of the electrical plant and interest are taken into account.

The most important instance of the application of water power for the electrical transmission of power in Great Britain is that at the Greenside silver-lead mines in Cumberland. The fall at the station is equal to a vertical head of 400 feet, and the effective horse-power is about 200. The generating station contains one of Gilkes & Co.'s vortex turbines of 100-horse power, driving a compound dynamo. The current is conveyed by bare copper conductors on poles, the distance being six furlongs to where it enters the mine at an elevation of 1850 feet above the sea level. The conductors from this point are insulated, and covered with lead. About three-quarters of a mile in the mine, or one and a half miles from the dynamo, a nine-horse power series motor works a three-throw pump, forcing the water 360 feet in height. Half-way between these motors the pressure is reduced from 600 to 250 volts for working an electro-locomotive in the lowest level of the mines, through which the water pumped from the 120 yards level, and the whole of the water used by two hydraulic winding engines is pumped. The total weight of the locomotive when loaded is 18 tons. The conductors in the level are phosphor-bronze wires. Great difficulty was experienced in fixing this plant. All main stations in the mine are lighted by incandescent lamps in series of six.

In the discussion which followed the reading of this paper Professor Unwin said that in America many electric plants are being worked by water fall. In the Calumet and Hecla mines power was transmitted electrically, it having been tried on a very large scale, but the engineer had come to the conclusion that it was very expensive, and in future it was proposed to go back to air.

Mr. Kapp said that in Switzerland electricity was now used in transmitting the power obtained from the Rhine. At 700 volts, 700-horse power was transmitted at the cost of 50 francs per horse-power per year.

Mr. Carter pointed out that England did not present many favorable cases for the use of water power, owing chiefly to the low head and variable flow.

As bearing very closely on this subject the *Colliery Engineer* refers to the paper of Mr. F. O. Blackwell read at the Chicago International Engineering Congress, and published in the Transactions of the American Institute of Mining Engineers, in which he gives as an example of transmission of water power by electricity, the Virginius mine at Ouray, Colorado, where 300-horse power is carried at 800 volts from a water power four miles distant. The cost of coal at the mine he said was formerly $18 per ton, which would amount for the present plant, to about $80,000 per year, equaling the total cost of the electric plant. The item of fuel was a complete saving, the expense of operating the steam and electric plant being about the same in other respects.

Mechanical Progress.

Bursting of Fly Wheels.

In a comparatively short time a large number of fly wheels have gone to pieces while running, says the *Manufacturers' Gazette*. The loss of property, time and life has been great. In one case $100,000 would not cover the loss. Why are these failures of wheels to hold together so frequent? Of these, while some had run for years, others were of recent construction, made since the era of high-speed engines. The work done by the engines was not all the same; they furnished power for cotton-mills, machine shops, electric-light stations, electric-power stations for street railroads and for other work. They were not all of the same class of engioes, the makers being widely scattered.

There is a reason for these failures, which should be found and remedied. The strains developed in fly wheels and pulleys are of an extremely complex nature, arising from many causes, so that the numerous rules and formulæ employed for proportioning them are almost entirely empirical in character. Experience and judgment have dictated largely the thickness of the rim, while the eye has played an important part in deriving the shape and taper of the arms. In text books on machine designs are found analyses of the strains in pulley arms due either to the pull of belt, the inertia of the rim or the centrifugal pull of the arms due to weight of rim, etc. These text-books also state that the strength of the rim is not affected by its thickness as regards centrifugal force; for, with increase of thickness, there goes an increase of weight, with a corresponding increase of centrifugal force and area of cross-sctlon to resist it. From this reasoning, wheels of good metal, perfectly true and in good running balance, are only limited in speed by a periphery velocity roughly assumed at about one mile per minute or 88 feet per second, a speed giving a low strain per square inch of section of rim, to wit, about 800 pounds per square inch. Yet, in view of these statements, wheels burst at low speed, others run and do not break at very high speed. Much has been written, many formulas deducted, and theories proven on paper why wheels break. Without going into argument, it is safe to say that a wheel can be made that will stand. Wheels are and have been running for years at a very high speed. A wheel 17 feet 9 inches, running at 7500 feet of rim speed per minute, band-saws with rims 8 and 9 feet in diameter, are running as high as 10,000 feet per minute. These wheels are cast iron throughout, heavy, and with a large number of arms. Many machines with wheels up to five feet in diameter run 11,000 feet per minute as a rim speed. If a bridge truss or mill floor is to be built, they can be calculated so as to be able to carry any load, the truss or floor resting on butments, walls, piers or posts for support. The rim of a wheel is practically the same as the truss or floor; it rests upon supports, which are the arms. First, make the arms as stiff and rigid in proportion as supports put under a floor; then make the rim of sufficient thickness, and no matter how fast the wheel may go it cannot break. A wheel should be put in that should not break under any strain that might arise from a speed given it by an engine, even though the engine run at the fastest speed it could attain from running away. An engineer would feel much aggrieved if it were hinted that he could not calculate the power of an engine so that any power required could be built, but when it comes to fly wheels he simply guesses and goes along. If the wheel breaks, great is the mystery. If it does not break, nothing is said. All engineers do not guess, for there are many good wheels built, and it is to be hoped that in the future all wheels will be good, but there are many wheels running to-day that should not be allowed to make another turn. If the owners of fast-running wheels will have their wheels examined by a competent engineer, and where wheels are found to be unsafe have them replaced by wheels of proper strength, much money, time and life will be saved, for the breaking of wheels will continue as long as there are weak wheels and a chance for engines to be overloaded or to run away.

Fastest Vessel in the Queen's Navy.

The recent rapid performances of the cruisers Columbia and Olympia—one on the Atlantic, the other on the Pacific—make the following, from the London *Engineer*, of especial interest. The types of vessel are so divergent, however, that comparisons are unfair.

We have the pleasure to record the successful official trial on Saturday last of H. M. S. "Havock," built by Messrs. Yarrow & Co. This trial was looked forward to with more than usual interest, the "Havock" being the first of twelve similar vessels of an entirely new and distinctive type, which are being built by private contract for the British Admiralty. They have been designed by Mr. W. H. White, Director of Naval Construction, and are intended to be superior to other fast vessels building by foreign powers, who, it is well known, have made great advances of late in the construction of such vessels. The name given to this new type is that of "torpedo-boat destroyer." They are intended to act against torpedo boats, and to have a speed superior to that possessed by such craft at the present time, and, what is of the highest importance, to be capable of maintaining that speed at sea, in which torpedo boats have been found to be sadly deficient. Their coal-carrying capacity will enable them to have a radius of action far greater than the present torpedo boats, and to test by practical experience how far the "Havock" can operate from a base, a further slow-speed trial is to take place at the end of this week. The "Havock" is called after a famous warship of some hundred years ago, and is 180 feet long by 18 feet 6 inches beam, and about 200 tons displacement. She has two sets of triple-expansion engines, with cylinders 18 inches, 26 inches and 39½ inches in diameter by 26-inch stroke, designed to give 3500-horse power at 400 revolutions per minute. They drive twin screws, having three manganese-bronze blades, 6 feet 2 inches in diameter. Her boilers are two in number and of the locomotive type, one to each set of engines, in separate stokeholds, forced draught being supplied to them by two fans by Allen & Co., and are designed for a working pressure of 180 pounds per square inch. Her guaranteed speed is 26 knots on a continuous run of three hours. This the "Havock" easily exceeded on Saturday, in spite of a very heavy sea—the water finding its way even into the engine-room—when she attained a mean speed during the three hours of 26¼ knots, the boilers keeping a plentiful supply of steam with the pressures ranging from 160 pounds to 170 pounds, and the engines averaging 360 revolutions per minute. Everything worked very satisfactorily with the exception of a slight mishap to one of the circulating pumps, which compelled the engines to be run for the latter half of the trial without the water service to the bearings, thrust, etc. Nevertheless no trouble was caused by overheating, and the trial finished successfully. The armament of the "Havock" consists of one 12-pounder quick-firing gun, mounted on the conning tower forward, and three 6-pounder, quick-firing guns, one on each side forward, and one aft on a high pivot. She also has one fixed bow torpedo tube and two revolving deck tubes, 18 inches in diameter. She carries an electric search light, supplied with current from one of Allen's dynamos, placed in the engine-room, where are also the air compressors, evaporator, steering engine, etc. Messrs. Yarrow & Co. are also building a sister ship, the "Hornet," to be supplied with Yarrow's patent tubulous boilers, and her speed is expected to be 27 knots.

An Ingenious Water-Wheel.

An order has been given for a power plant of the following description by a Minneapolis man, for use upon a small river in Minnesota. Three canoes are to be anchored abreast in midstream, about eight feet apart, and they will sustain the shafting on which two paddle wheels revolve. The current will run these wheels, gearing will convey to a driving wheel in one of the boats the power developed, and a wire cable will complete the transmission to the shore. Pains will be taken to keep the paddle shaft at right angles to the current. In order to submerge the wheels sufficiently, the canoes will be partly filled with water, the amount being regulated by water-tight compartments. Each paddle has a superficial area of 30 square feet, which, when wholly immersed in a rapid current, must withstand a considerable strain. The arrangement is such that the average turning effect is about equal to 60 square feet, immersed all the time.

Harvey Process for Steel Rails.

The Harvey process of hardening steel for armor plates reaches only the surface or skin of the metal. Just before his recent death, the inventor took out a patent for applying the same method to toughening the top of steel rails. He provides a way for introducing about five per cent of carbon into the upper part of the head, from 2½ to 4 per cent into the lower part and into the web, and less than two per cent into the base or flange.

Scientific Progress.

Jupiter and His Satellites.

"The Planet Jupiter and the Phenomena of his Satellites" was the subject of Professor E. E. Barnard's lecture on astronomy at the First Unitarian Church, in this city, recently.

The lecture was illustrated with stereopticon views and charts, which made all the phenomena described extremely clear to the audience.

The reasons for concluding that Jupiter is of much less density than the earth were first explained, and then the lecturer went on to describe the surface of the planet and the reasons why so little is actually known about the materials of which its surface consists.

"The spectroscope gives us little information about Jupiter. When we examine the spectrum of Jupiter, like that of the moon, it is only reflected sunlight. Certain elements, however, lead us to believe that the planet is surrounded by a dense atmosphere.

"We can observe a great difference between Jupiter and Mars. The latter has well-marked features, which in all probabilities are seas and continents. Jupiter's markings are not like those of Mars. Dark bands like belts surround the planet. No markings were discovered till 1630, when two prominent ones were located on each side of the equator. Other belts were afterward seen crossing the poles. These belts consist apparently of clouds."

The lecturer went on to describe other markings of Jupiter's surface, especially the bright spots prominent in the planet's southern hemisphere and the black spots in his northern hemisphere, the locations and forms of which are changing all the time. "All these markings have different motions. A year is a long time for a spot to remain visible.

"The phenomenon of a bright red spot was first noticed on Jupiter's surface in 1874. It was calculated to be about 30,000 miles long and about 7000 miles wide. In 1880 it was still visible, but in 1882 it had begun to fade and be obscured with a white mist. Ten years later it became clearer, and is still visible, although a little difficult to see.

"There are various theories to account for these phenomena. It is supposed that Jupiter is in an intensely heated condition midway between the temperature of the earth and that of the sun. All the water on the planet is converted into steam, and we look not upon Jupiter, but upon a steam vapor."

The professor further stated that his own observations led him to the conclusion that it was not the actual surface of the planet itself that could be seen through the telescope.

The rest of the lecture was devoted to an interesting account of Jupiter's five satellites. The existence of four of these bodies has long been known—indeed, the velocity of light was first determined by the eclipses of Jupiter's satellites. The fifth moon, which was recently discovered, is only 100 miles in circumference. It is so small as scarcely to be visible and revolves around the planet with immense velocity.

The last subject touched upon was the comets captured by Jupiter's attraction out of their original orbits and brought within the solar system.

New Explosive.

A new explosive, invented by Dr. Ochse, who was formerly connected with the Krupp works, has caused a fall in Dynamite Trust shares. The new invention consists of an explosive gas cartridge formed of a glass tube, containing a few grammes of water, which, by electricity, is conveyed through a platinum contact and is decomposed into elements of vapor oxygen, which produce an explosive gas. The pressure can be produced according to requirements up to 5800 present atmospheric pressure. The experiments which have already been made by the military authorities with the new explosive have been successful, and show that it possesses the quality of safety, and that it is far-reaching in its effect.

Balloon Photography.

Discoursing on "Balloon Photography," with special reference to military objects, Captain A. M. Mantel observes that the difficulty of photographic work is much greater in a captive balloon than in a free one, the latter being steadier. When the wind speed is more than 16 miles an hour, there is, he says, but little hope of satisfactory photography from a captive balloon, although such a speed is but little hindrance to work from a free balloon. The mere movement of translation has very little blurring influence, but the gyratory movement of the balloon sometimes gives trouble; this is, however, more pronounced when the balloon rises or falls.

To Save Lives at Sea.

A new apparatus for saving life at sea consists of a structure which, when fitted on shipboard, serves all the purposes of a bridge and chart house, or an ordinary deck house, but which can be released with two or three revolutions of the disengaging screw, and at once made available as a refuge from the sinking ship. It is secured to the deck beams by strong, tested steel stretching screws, and is constructed of light steel plates, with strong T-iron frames running longitudinally and transversely, and having ballast tanks, regulated by step valves to adjust the draught of water. It is named the "Refuge," and is an English invention.

Heating and Lighting Street Railway Cars.

Methods of heating and lighting street railway cars were considered in a report by Mr. G. F. Greenwood to the American Street Railway Association, lo which are given results of investigations by the anthor in regard to the expense of several of the methods described.

Three methods of heating are discussed: First, primary heaters, or those in which the heat is obtalned from fuel consumed on the car; second, secondary heaters, in which the heat is generated elsewhere and transmitted through some storing medium in the car; third, electric heaters.

Good heaters of the first class can be purchased at from $15 to $24 per car, and can be installed at a cost of ahout $1.50 per car.

The cost of operating these per car day of 18 honrs, with fuel at $4.75 per ton, lahor at $1.50 per day, aod maintenance at 25 per cent of the cost of stoves, is, for fuel, 8.7 cents; maintenance, 3.8 cents; labor, 3 cents; or 15.5 cents per day per car. In the second method there are two types, one using steam, the other water. In the first steam is nsed to heat earthenware cylinders or tuhes placed in iron pipes, and in the other heated water is forced into radiatiog tuhes in the cars placed along or under the seats; a reservoir on the car is charged with steam or hot water at a charging station. As this type of heating is stated to be at preseot in an emhryo state, reliable figures are not given as to cost of operation. Electric heaters can he installed at a cost per car varying from $35 to $46. To keep the temperature at, say, 50° Fahr. in moderately cold weather requires an expenditure of 2.66-horse power, and in severe weather from ahout 5.33 to 6.66-horse power, estimating the cost of power to he .9 of a cent per kilowatt hour (.7 cent per horse-power hour), the cost of heating a car per day of 18 hours is given at 32.4 cents, 64.8 cents and 81 cents, respectively, on the above hasis of power consumed. To these figures must be added 20 per cent for depreciation and repalrs, which will amount to ahout 5.1 cents more per day.

Considering all the elements that enter into the question of heating cars, the conclnsion is arrived at that the best method is that of using a primary heater fired with anthracite coal and operated from the inside of the car.

Three methods of lighting street railway cars are mentioned—using oil lamps, the electric system, aod the gas system—and of these only the two latter are considered.

It is advised that an incandescent light be placed in each lamp-box at the end of a car, so that the signal light may he distinguished readily, and to illumine the advertisiog rack over the window. On the ceiling there may be two incandescent lamps located about four feet from each end, and by having a divided circuit the fifth light can be used in headlights on the hoods of the cars. The result is that there is a minimum numher of incandescent lights in the cars, the hest lighting effect is ohtained, and the annoyance of oil headlights and labor attending their use is removed. The cost of lighting by this method need not he over one-half cent per hour, or four cents per car per day, estimating that the car uses its light eight hours every day.

The third method, that of using gas, is well spoken of, but, owing to lack of experience, no data are given in regard to the same.

In conclusion, the opinion is expressed that the best method of heating street railway cars is by the use of a primary heater or stove, and that for lighting the use of such lights as can he secured in connection with application of electricity as a motive power, or a reliable gas system, provided the latter can be operated economically.

Electricity.

The Electric Canal Boats.

The late trial on the Erie canal of cana boats propelled by electricity is thus described by the *Electric Review*, and is somewhat more complete than our previous notice:

The first public trial of the Frank W. Hawley, the canal boat propelled by electricity, took place at Pittsford, New York, on the Erie canal, between locks 63 and 64, on Saturday, November 18th. The State of New York appropriated the sum of $10,000 toward experimenting upon the application of electricity to canal-boat propulsion. It had been thought by many that the use of a propeller in a canal would be detrimental to the bank, that the repeated swash and beating of the water against the walls of the canal would be so destructive that it would not be advisable to employ a rotary motion for moving the boats. This theory took such a hold that for some reason the use of motors on canal boats was not thought practicable. Then, again, the installation of central stations was deemed too expensive an outlay to be considered economical. For these reasons nothing was done in this respect; but, with the advent of the Niagara Falls Power Company, the facilities thus offered for canal-boat propulsion made the scheme plausible.

With the power available there could be no reason why the apparatus should not be perfectly successful in its operation. The Frank W. Hawley, an ordinary canal boat, was provided with Westinghouse motors similar to those used on their street cars. Two trolley arms were used, as it was not thought advisable to use the water for the return circuit. A temporary trolley line was erected, having, of course, two overhead wires.

When all was ready for the trip a preparatory trial was made Friday evening, to be sure that everything was in working order.

A prominent engineer who was present at the trial declared that he could see no possible reason why electricity should not supplant the patient mule, and that the apparatus, being no departure from the ordinary, should not operate to perfection. The steering of the boat is not in the least affected, and no driver is necessary in any emergency. Trailers may be attached and one boat may serve to draw six or seven heavily loaded boats. The motors used will be calculated for about 500 volts, and it is not stated what the exact design will be to be applicable to this departure.

In this trial trip the power was obtained from the Rochester Street Railway Company's power house, whose mains generally carry about 500 volts, but only 400 were employed at the boat.

It is merely a question of time and the amount of available current furnished when the entire canal system will be operated by electricity. Difficulties may arise which, of course, cannot be foreseen, and which only actual experience can enable the engineers to obviate, but as this is the first application of electricity obtained from a central station, to the motive power of boats, a field is thus opened which is full of possibilities.

Storage Battery Cars.

The experimental use of storage battery motors on the Second avenue surface road in New York since last May has been the subject of interesting comment in electrical journals. The trial appears to have been a thorough one. Six cars have been in use and they have run more than 40,000 miles. Since August 1st they have been moving on five minutes' headway for about eleven hours a day, and during the entire period traffic on the road has never been delayed, and the cars have not missed one-half of one per cent of their schedule trips. Up to this time the storage cars have been running between Ninety-sixth street and Harlem river, but now they are to come down town as far as Astor place.

Each car carries a battery of 144 cells arranged in two trays, which are introduced through openings at the end of the car, and are placed under the seats one tray on each side. Sixteen of the cells are in a separate circuit, and at night they serve to maintain incandescent lamps. Each car runs about three hours before the charge is exhausted, and the batteries are changed in four minutes by machinery which is operated by electricity and handled by one man. We take from the *Electrical World* the following description of the device by which the movements of the car are controlled:

"The controller has seven points; when the pointer is at the zero mark, the pointer is off entirely; when on the first point, the armature is short-circuited on itself, and by means of this, on the reverse, motion, the car can be stopped in a short distance by the breaking action of the motor acting as a dynamo; when on the second point, the cells are in multiple in four sections; when on the third point two sections of the battery are in multiple and two in series; on the next two points the fields are weakened, thus giving two further increases of speed. In stopping the car the action is to reverse that just described, and there is a reversing point beyond the zero. As will be seen this gives a very thorough control of the speed, and in actual operation, as has been demonstrated, by a lengthy trial, the cars stopped from full spead ahead in 25 feet."

Full speed is ordinarily 12 miles an hour, and the operator's power to stop the car easily within so short a distance tends to prevent such accidents as take place every day on trolley roads. The company has published a complete statement of the cost of operating these six cars, from which it appears that the entire expense has been 9.32 cents per car mile. It is also shown that the plant used is capable of keeping 18 cars in operation, and a frank statement as to the cost when 18 cars are used reduces the expense to 5.29 cents per car mile. This estimate is regarded by such authorities as the *Electrical World* and the *Electrical Engineer* as a conservative one. We have not at hand any statements of cost per car mile under the trolley system with which these figures may be compared, but the comments of the two journals already mentioned are very encouraging to those who hope to see the storage battery system in general use. The *Electrical World* says that "the results" of the trial "have been very encouraging, and that, even on the comparatively small scale on which it has been conducted, the cost per car mile compares favorably with some methods of street railway traction, and is cheaper than others."

To Harness the Bosphorus.

There is a certain Greek engineer, now resident in Europe, who ought to have been an American, says *Electricity*, for he is the author of just the kind of scheme that, in the matter of boldness and picturesqueness, the world at large looks to Yankeeland to originate. At various points on the Bosphorus the current from the Black sea to the Mediterranean has prodigious force, and it is now proposed to harness some of this waste power for the lighting of the city of Constantinople and a considerable length of the adjacent coast by electricity. The way in which the inventor intends to turn the ocean currents to account is to erect three very powerful dynamo machines upon the three points of the Bosphorus where the current has the greatest force, and, so far as can at present be learned, the project appears to be practical and realizable. It is stated that a company of capitalists has been formed, the necessary funds subscribed and application for a concession addressed to the Turkish Government. It is understood that the Government has taken the project into consideration and has nominated a commission to report on it.

Useful Information.

How Diamonds Are Cut.

The first operation in the art of diamond-cutting is that of splitting or cleaving, says an exchange. The process consists in determining the proper plan and direction for dividing the stone to give it the final shape it will assume, without needlessly sacrificing any of the weight of the stone. On the sound judgment and skill of the splitter—qualifications gained by long experience—the future of the stone depends. He decides how the stone must be shaped so as to retain the highest weight with the most brilliant effect. He examines it for flaws and defects, and must be able to know to a certainty whether the imperfections are at the surface or in the heart of the stone. Having made his decision, he proceeds to work. The rough stone is imbedded in cement and a dull edge diamond is rubbed across its surface, so as to leave an indentation that determines the line of cleavage. The operation is then repeated with a diamond having a slightly sharper edge, and finally one as keen as a razor. A marked depression is thus made, into which a sharp steel knife is inserted. A quick and light blow divides the stone into two parts. It is now removed from the cement; the main part is then replaced in the cement and another fragment is split off, and these operations are repeated until all the flaws are removed and the stone has received the proper outlines of the form it is destined ultimately to take on. The fragments are all carefully preserved, to be cut into tiny gems, and for other uses.

The next operation is that of cutting, during which the stone receives its finished outlines. This work is still almost entirely done by hand. The cutter has two diamonds attached by cement to wooden handles, and a box in which to collect the diamond dust. The cutter must laboriously grind the two stones together in order that by their mutual attrition he may develop, from the primitive form received from the splitter, the facets of the brilliant or rose form that the stone is required to take. This work requires great muscular force, and the hands of the cutter must be protected by stiff gloves of leather.

An Important Link.

A railroad to connect the eastern coast of Mexico with her Pacific seaboard, over the Isthmus of Tehuantepec, may soon be an accomplished fact, now that a contract to build the remaining 35 miles of road has been signed by the well-known English capitalist and builder of American railway lines, Chandos Stanhope. The new route will tap the rich coffee-growing country on the southern and western slope of the Mexican Cordilleras. At the present time freights on the coffee of southern Mexico are cheaper to London than they are to New Orleans. The new line will bring the product almost to our doors; steamers will be enabled to load on the eastern coast, whence it is scarcely a day's sail to Galveston, and but little more to New Orleans, and those cities will then become great points of distribution. Besides a possible cut in the price of coffee in the American market, the new road will have a further important effect in breaking down the monopoly of the Panama railroad.

To Stand an Egg on End.

A contributor to the *Scientific American* gives the following: My method of standing an egg on end is not by cracking it, but by taking the egg in one hand and striking it in the other three or four strong licks, which readily breaks the thin membrane separating the air from the end of the egg; it also breaks up the yolk of the egg; the parts of the contents of the egg being thus free to move among themselves, the heavier ones settle to the bottom, the lighter ones above, and the air at the top. This is done by placing the egg on end a few seconds and holding it perpendicularly. The center of gravity is thus easily brought within the base, and the egg stands readily on either end. I find that this is a fact that is known by but few. It is sometimes used by jugglers who pretend to conjure by incantations.

The Berlin Sewage Farms.

The city of Berlin is absolutely cholera-proof, writes Mr. Poultney Bigelow in the *Cosmopolitan*. Beside that, she disposes of all the sewage within her borders at a profit of two per cent. The city of Berlin, nearly 20 years ago, purchased some thousands of acres of flat sand-wastes adjacent to her boundaries. With these she began the experiment of utilizing sewage. The city was divided into districts. In each district the sewage flows into an immense cesspool. Thence it is removed by powerful pumping machinery to the fields of the sand-wastes and spread upon them.

There are no "barnacle politicians" in Berlin to hang on and ruin the workings of the municipal Government, Mr. Bigelow says. The administration of the sewage farms is in the hands of citizens of the highest respectability, and under their management the result has grown to be an object lesson to all the cities of the earth. The pumps work night and day. The lands irrigated by the sewage ditches are cultivated in grain and vegetables. The product is the finest by far that appears in the Berlin markets, and is the most in demand. Land about Berlin in its natural state, before the sewage irrigation was applied to it, was worth $182 per acre. As soon as it is put under the operation of the gigantic pumping works, however, it immediately rises in value to $400.

Bits of Information.

No bird can fly backward without turning.

New York contains more Hebrews than there are in Jerusalem.

In 1721 an English law was passed against calico, fining wearer and seller.

Noah's ark was bigger than the Great Eastern and it proved to be a perfect success

In 12 marriages out of every 100, one of the parties has been married before.

The average annual rainfall in the vicinity of Neah bay, Wash., is about 100 inches.

The word "dandy" was first used in England in a poem by Galoway, published in 1780.

No tenable explanation of the manner in which the pyramids were built has ever been given.

The boo tree in the sacred city of Amarapoora, Burmah, is said to be the oldest tree in existence.

It has been calculated that 800 shots were fired for every man wounded during our late Civil War.

If a well could be dug to a depth of 46 miles, the air at the bottom would be as dense as quicksilver.

Massachusetts has more incorporated cities of more than 10,000 inhabitants than any other State in the Union.

Six Months' Food for Paris.

The French Commissariat and the Minister of War have been figuring on another siege of Paris and the amount of food that would necessarily have to be laid in for man and beast. Here are the figures: Breadstuffs, 243,000 tons; meat, 118,100 tons; salt, 14,793 tons; dry vegetables, 34,440 tons; potatoes, 295,260 tons; milk, 6,602,900 cubic meters; coal, 1,000,000 tons; hay, 688,940 tons; oats, 50,052 tons; straw, 68,894 tons.

The above are given as the very lowest estimates on a six months' food supply for

the 3,000,000 human beings and the 2,750,000 domestic animals now within what is known as the outer defense lines." Such a supply would cost $100,000,000.—St. Louis Republic.

The Way to Sit.

When our grandmothers were girls and stralght-backed chairs instead of cushloned divans were the nsual resting places, the young women held themselves with a straightness that was almost stiffness. Then when they grew old they still held themselves like duchesses. For it is the way one sits rather than the exercises one takes that determines the erectness of the figure.

A prominent physician says that the proper sitting position requires that the spine shall he kept straight and that the support needed for the upper part shall he felt in the right place. Therefore, it is necessary to sit as far back in the chair as possible, so that the lower end of the spine shall he hraced against the hack of the seat. If this hack is straight the shoulders will also rest against it; hut even if the shoulders have no point of support, it will he found that they do not need it when the hase of spine is supported properly. This position makes no strain upon the ligaments of the spine. Every organ of the hody is properly fixed hy this attitude.

The feet should rest squarely upon the floor; the hands should rest lightly in the lap, and thns perfect eqnillhrium and rest is secured. The arms should never he crossed, for that position causes a strain upon the spine, places a weight upon the stomach and diaphragm and thus increases the lahor of digestion and respiration.

Once in a while it is a good thing to place the arms hehind the hack, glving, as it does, the fullest expansion to the upper part of the hody.—N. Y. World.

Big Figures.

It is a fact of striklng magnitude that more than $1,200,000,000 of rallroad property in this country is now in the hands of receivers. There is likely to he a general reorganlzation of insolvent railroads, and the Government proposes to take a hand in the reorganization of the Union Pacific, in which it has a creditor's interest of about $52,000,000. Five great railroad systems—the Union Pacific, Northern Pacific, Reading, Erie and Richmond Terminal—which now enjoy the protection of receiverships, have a mileage of 25,000 miles, a combined funded indehtedness of $517,000,000 and aggregate assets exceeding $1,174,000,000.—Pittshnrg Post.

$1000 WORTH OF LAW FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or any body else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientis nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing. The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Oobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

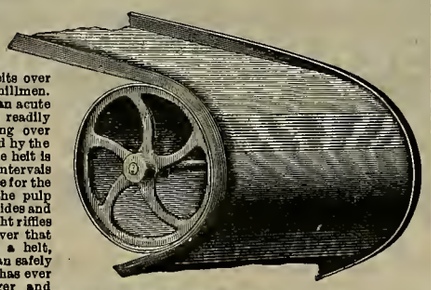
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

QUICKSILVER
—FOR SALE BY—
The Eureka Company of San Francisco,
Rooom 1,
426 CALIFORNIA ST., SAN FRANCISCO

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and orming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Inyo.

RICH GOLD DISCOVERIES. — Inyo *Independent*: Good gold diggings have recently been discovered in Redrock canyon. About one mile below the stage station a narrow canyon runs north at nearly a right angle to the main canyon. Up that narrow canyon about one mile is the placer ground. The discoverer in four days took out $150. He took the gold to Mojave and sold it there. Then with a partner he started back to his claim, and in two days the two men took out $260. They put the gold-bearing dirt into sacks and carried it down to the stream in Redrock canyon, where they washed it out. Some of the sacks of dirt yielded $40 worth of gold. The report of this rich find had the usual effect of causing a rush to the ground, and last Sunday it was told at the station at Redrock canyon that 200 men were already there prospecting and locating claims. The claim is about 25 miles north from Mojave.

Nevada.

WORK RESUMED.—Grass Valley *Union*: For the past several months the company operating the Centennial mine has been actively engaged in preparatory work, getting ready to carry on mining operations on an extensive scale. The incline shaft has been retimbered throughout and heavy "T" rail laid in the shaft. Until the present time the mine was being pumped out by a powerful Dow steam pump, capable of throwing 12,000 gallons per hour. This steam pump has freed the mine of water to the 400 level. Last Monday an eight-inch Cornish plunger pump was started, and there is a bit of interesting history connected with this pump.

In 1882, the then owners of the mine were having some hot litigation, but it was thought all difficulties would be peacefully and speedily adjusted. Pending the settlement of these troubles the mine was closed down and permitted to fill with water. All the pumps, water column, track and tools were left in the mine and have been submerged for the past 11 years. Now that the water is out, the pumps were found to be in perfect condition, and the eight-inch plunger has resumed work after all these years of idleness.

Yesterday Superintendent Stoddart brought some handsome samples of quartz to town which came from the 300 level. The ore showed plenty of free gold and is rich in sulphurets.

The company operating the Centennial mine is a good one, consisting mostly of Sacramento business men, and they have a valuable property. We expect to hear of very flattering results in the early future.

NEW HOISTING PLANT.—*Union*: The Champion Mining Company of Nevada City has decided to erect new and extensive hoisting works upon the old Merrifield ground.

PROVING A GONEAND.—Nevada City *Transcript*: The opening up of the Original Harmony mine is proving a Godsend to this district. The rich prospects found in this mine gave impetus to other companies to go ahead. After the strike was made in the Harmony, Hon. W. W. Stow and others purchased what was known as the West Harmony, and they have to-day one of the best gravel mines in the State, as the large output of bullion each clean-up fully demonstrates.

Other companies on that ridge were then started up, and the prospects in all of them are very encouraging. Following along up the ridge, work was resumed in the Lupin, and the prospects are very flattering. On Wednesday this company let a contract to Mackerel & Mulloy to extend their tunnel 100 feet, and there can hardly be any question about their striking fine paying gravel in that distance.

If the Lupin and other companies get into good gravel, in all probability in the spring Hon. W. W. Stow will open up two other gravel mines which he owns in that section.

Placer.

A NEW BONANZA.—Colfax *Sentinel*: Within another year eastern Placer will have one of the largest quartz mines in California. The Sterrett mine is located about 12 miles south of Oisco on the North Fork of the American river, between it and Sailor canyon. At the surface there are two ledges separated by a dike and here each ledge has a width of 60 feet. Six hundred feet in from the surface the two ledges come together in one formation and here the ledge is 70 feet in width. Tunnels have been run into the ledge from both the American river and Sailor Canyon sides, 1000 feet each, and besides other prospecting has been done to satisfy the owners that the mine is a bonanza. At present men are at work opening up the mine and putting up buildings and getting out timbers for the large stamp mill and chlorination works to be put up in the spring.

The huge ledge prospects from one wall to the other, both at the surface and all the way to the end of the 1000 foot tunnel. Although generally of a low grade ore, yielding in free gold $2.50 a ton, yet it abounds in sulphurets. In some places the ledge is so mineralized that sulphurets can be taken out by the solid block of three and four feet. In some places the ore has gone over $90 a ton, although it is generally of a low grade. Owing to the immense size of the ledge and its bearing free gold throughout, even the low grade ore can be worked at great profit. Besides with chlorination works the sulphurets will pay well.

The company owning the mine is composed of San Francisco and New York capitalists. Geo. S. Montgomery, the well known San Francisco millionaire is at the head of the company and every preparation is being made to put up an extensive stamp mill and chlorination works as soon as possible in the spring. A 60-stamp mill will be put up at first.

PUSHING THINGS.—Colfax *Sentinel*: The machinery for the Gold Ring mine at Green Valley has all been taken in safely and will soon all be in place. Other improvements, such as putting up necessary buildings, are being pushed with vigor and in about another month everything will be in readiness for active operations.

The Golden Eagle mine at Shady Run, recently purchased from Henry Dresler by A. Rodger of Alta, is being put in condition. At present the necessary buildings for the accommodation of a large number of men are being built and there is every prospect of the mine becoming one of the best in the section.

Geo. Woods, who has charge of the Foss mine at Lowell Hill, has just completed a telegraph line from the mine to Dutch Flat.

The dam for the Polar Star mine at Dutch Flat is completed for this year. The commissioners have the petition of this mine under consideration and a favorable decision is expected soon.

There are still a number of miners at work on the north fork of the American; they are doing well and will work there till high water chases them out.

Plumas.

A BIG ENTERPRISE.—Plumas *Bulletin*: Last week Supt. A. B. White and James O'Brien of the Quincy Mining and Water Company came up from San Francisco to inspect the work done on their property, to pay off the men and to look after other business. The greater part of the work on the 40-mile ditch is completed, and the capacity of the reservoir at the head, by raising the dam, has been increased fully one-third. It is the purpose of the company, next year, to further increase the storage capacity of this reservoir. With these improvements they expect to have a seven-months' supply annually. The big ditch will carry fully 2000 inches of water. It will be seen, therefore, that the company has one of the best water privileges in the State. It covers an immense territory of placer-mining ground, which will require a great many years to work out. The company now owns 2200 acres of this. It is the intention of the corporation to construct, before the winter closes in, a large and substantial restraining dam across Spanish creek, at the Devil's Elbow, so as to protect this valley from the down-flow, not only of debris already in the canyon, but from any that might reach it through future mining operations. Inasmuch as the success and value of its property will depend upon the efficiency of the restraining dams, the company will see to it that they are of a permanent and substantial character. To do otherwise would be to sacrifice, not only their investments, but the certainty of big returns from their mining enterprise, which undoubtedly is one of the best in the State.

Siskiyou.

GOOD QUARTZ LANDE.—Yreka *Journal*: Esstlick & Starr have discovered a fine ledge of quartz at Oro Fino. From five pans of quartz they realized $52 in free gold. The ledge varies from four to five feet in thickness. The Greenhorn blue gravel mining company's hoisting apparatus is now in good working order, with a new shaft. The black sand from the claim containing very fine gold, which cannot be saved in the sluices, is sent below where it is extracted with good success by scientific process, the last lot realizing about a dollar to the pound of sand.

The work of pumping out the old Siskiyou quartz ledge on Humbug, is progressing rapidly. Boyle & Co., at head of north fork of Humbug are now running a new tunnel 200 feet lower down, and another tunnel is also to be run into the old Spencer mine, with good prospects of success. The Punch creek ledge on Humbug, is now being worked by Wight & Co., a Portland firm, who intend to give the ledge a thorough test on an extensive scale.

NEVADA.

Washoe District.

ON THE COMSTOCK.—Virginia *Chronicle*: Mining men who have visited the 1100 level of the Jacket mine say that the ore vein struck in the raise from that level is looking fine and that it is a most promising prospect. The ore is very rich and it has widened in opening up. A good deal of preparatory work has been done at that point during the week, and when the ledge has been opened up farther it may prove to be a bonanza.

The ore mined from the Occidental last week went $54 per ton, assay value. About 10 or 12 tons of this ore is being taken out weekly from the ledge above the 400 level.

The east crosscut on the north boundary of the Best & Belcher is out 30 or 40 feet. It was in soft porphyry at last accounts. Hopes are entertained that this crosscut will open up ore in the north part of the mine.

The Rule drift in Con. Virginia will be advanced only about 20 or 30 feet this week, as a good deal of work in the station had to be finished. The drift will employ four men on a shift instead of three as before stated.

Business at the Con. Virginia is branching out in a most satisfactory manner. This morning the West Con. Company began operations, and the result was the employment of twelve miners—four on a shift—a foreman and superintendent. The first shift went to work at 7 A. M. The superintendent is S. V. Tangerman and the foreman Sam Treglone.

The West Con. will repair the shaft to the 1100 level, open an old north drift and then drift west. After the shaft has been repaired the company will start work on the 800 level of the Con. The stock is not listed at present, but it is presumed that as soon as ore is encountered it will be put on the Board.

The reports of the several Comstock mines for the week ending December 2 are as follows:

CON. CAL. & VA. MINE.—1650 level—The drift running north from the foot of the upraise on the sill floor of this level has been extended during the week 22 feet; total length, 137 feet; face in clay and quartz. The drift running north (at a point 52 feet down) from the winze sunk from the west crosscut from the main northwest drift has been extended 26 feet; total length, 126 feet; in quartz with a little clay. The crosscut running east from this north drift (at a point 40 feet north from the winze) has been extended 28 feet; total length, 121 feet; continuing in porphyry and quartz. In the vicinity of the winze, at a point 20 feet down, there has been extracted during the week 36 carloads of ore—about 34 tons—the average assay value of which is $45.57 per ton.

The southwest drift (the Rule drift) from the 1000-foot station of the Con. Virginia shaft has been advanced 30 feet; face in porphyry, clay and seams of quartz.

OPHIR.—1465 level—The crosscut running west from the main north drift, at a point 124 feet south from the winze station, and about 300 feet north from the main shaft station, has been extended during the week 29 feet; total length, 220 feet; face in porphyry, clay and quartz.

Have continued (jointly with the Mexican Company) the work of making repairs to the main shaft.

MEXICAN.—1465 level—From the top of the upraise which has been carried up 45 feet from the sill floor of this level—at a point 40 feet west from the main north lateral drift and 100 feet north from the south line of the mine—a south drift has been advanced 23 feet; face in porphyry, clay and quartz.

Have continued (jointly with the Ophir Company) the work of making repairs in the Ophir shaft.

UNION MINE.—900 level—The Union Con. and Sierra Nevada joint north drift running from the joint west drift, at a point 1520 feet west from the shaft, has been extended during the week 17 feet; total length, 259 feet; face in porphyry and small streaks of clay and quartz.

UNION SHAFT.—The joint Sierra Nevada and Union north drift from the west drift, 1520 feet west from shaft, 900 level, is out 17 feet; total length, 259 feet; face in porphyry and small stringers of quartz.

SIERRA NEVADA.—The south lateral drift from the intermediate tunnel has been advanced 20 feet; total length, 260 feet; face in porphyry. The joint Sierra Nevada and Union north drift from the west drift, 1520 feet west from shaft, 900 level, is out 17 feet; total length, 259 feet; face in porphyry and small streaks of quartz.

ANNES.—On the 420 level west crosscut from the end of the north drift run from northwest drift from east crosscut No. 1, north, has been advanced 10 feet; total length, 30 feet; formation, quartz and porphyry.

GOULD & CURRY.—200 level—West crosscut No. 5, started in northwest drift, has been extended 10 feet, passing through hard porphyry. total length, 775 feet.

BEST & BELCHER.—200 level—The north drift which was started in west crosscut No. 3, 175 feet from the main north drift, has been extended 12 feet, passing through soft porphyry and stringers of quartz; total length, 26 feet.

900 level—The west crosscut which has been started on our north boundary has been extended 35 feet, passing through soft porphyry; total length, 106 feet.

SAVAGE.—On the 1100 level we are extracting ore of fair grade at several points from the 11th floor up to the 21st floor. The north drift from the station on this level was advanced 18 feet; total length, 59 feet; face in quartz and porphyry. During the week we have hoisted 201 cars of ore. Shipped to the Nevada mill 210 tons and milled 120 tons. Car samples average $24.74 per ton. Battery samples average $23.37. Bullion yield for the week $1988.28. Shipped to the United States mint at Carson, November 25th, 274 pounds of crude bullion. The Nevada mill was stopped from the 22d to the 25th inst. On the 1050 level the east crosscut was advanced 14 feet, making its total length 45 feet. The face is in quartz and porphyry.

HALE & NORCROSS—Main Shaft—Have been easing timbers in main shaft where necessary.

1300 level—We continue stoping out ore from the winze below this level, and extracted during the week 26 cars of ore, assaying $33.71 per ton per car sample, and 13 cars of ore, average assay per car sample $19.57 per ton.

POTOSI.—The east crosscut, 200 feet north of south line, 750 level, is out 120 feet; face in porphyry. The north drift, 35 feet above the 1100 level, is out 108 feet; face in porphyry. The south drift, 200 feet east of Potosi winze, 1100 level, is ont 75 feet; face in porphyry and low-grade quartz.

CHOLLAR.—The north drift, 100 level, is out 192 feet; face in quartz that gives fair assay. Have completed repairs in the west drift, 100 level, and are putting in new timbers in the main incline at the 1100 level.

WASH.—The west drift from the station, 820 level, is out 350 feet from the shaft; face in porphyry and seams of clay.

BULLION.—The west drift from the station, 820 level, Ward shaft, is out 350 feet from the shaft; face in porphyry.

CROWN POINT.—The south drift from the 700-level stope has been advanced 15 feet during the past week, and is out a total distance of 49 feet. The face is in quartz and porphyry, samples of which average from $2 to $7 per ton.

ALPHA.—Are repairing the engine foundation at the Alpha shaft.

EXCHEQUER.—Are repairing the engine foundation at the Exchequer shaft.

KENTUCK.—1100 level—The west crosscut from the south lateral drift is in 44 feet; face in quartz and porphyry. The main south drift in the west ledge is in a total distance of 60 feet from our north line; face in low-grade ore.

SEC. BELCHER.—The drift to the north, from the south raise from the 1100 level, is now out a total distance of seven feet. The quartz in the face is from three to four feet wide, but is low-grade and mixed with considerable porphyry. Started a drift to the south from the raise, 1200 level, and is now out 14 feet. The face is in a mixture of clay porphyry, with small streaks of quartz running through it.

OCCIDENTAL.—During the week we have extracted from the west ledge above the 400 level about one to two tons of ore per day, of the average assay value of $49 per ton. The west crosscut from No. 2 upraise, started at a point 75 feet below the 300 level, is now in a total distance of 148 feet, and continues in porphyry and quartz.

JUSTICE.—The Blane tunnel is now out a total distance of 202 feet, having been advanced 29 feet during the past week. The face is all in quartz, giving low assays, and is a great deal softer than it was last week.

Riley District.

PRONOUNCED A FAKE.—Pioche *Record*: Duncan McDonald, Morgan Williams and others, who left last week for the gold excitement on Muddy, returned last night and report the whole thing to be a fake. Instead of gold-claim locations, hundreds of prospectors and great excitement, as reported, they found only one or two weary prospectors searching for something that would pay to locate, and that something is not yet found. West of the valley, at about the place where rich finds are said to have been uncovered recently, is a large ledge, traceable for miles to the westward, which appears, however, to be barren, and prospecting this is what brought on the recent excitement. Other prospectors who went down from Pioche will return shortly.

Ferguson District.

A $400,000 DEAL.—Pioche *Record*, NOV. 30: On Saturday last, Samuel T. Godbe secured options on the Monitor and Jim Crow properties at Ferguson district, on 90 days' time, and the consideration involved in the transactions is reported to be $450,000. D. A. Reeves, A. C. Ellis and Frank Wilson part with the Monitor, Monitor Dump, west half of the Cliff, the Princess, seven-eighths of the Lucky Bar and three-fourths of the Millionaire claims, on a basis of $300,000 it is said. This still leaves them the April Fool and several other claims lying immediately north of it, of great value in themselves. Messrs. Nesbitt Bros. and Mrs. J. McFadden list seven-eighths of the Jim Crow claim on a reported basis of $150,000.

These properties are regarded now as the cream of Ferguson district, and their transfer into the hands of some company willing to work them will bring Ferguson out as one of the first gold camps of the coast.

The Monitor Dump and the Jim Crow are each working on the same rich ore body, their workings being but a short distance apart on the surface. The side lines of the claims is said to pass directly through the ore deposit. The vein is a fissure in quartzite and porphyry. The strike is about north and south, and the dip is something like one foot in five. Heavy croppings, almost a reef, appear above the tunnel, 40 feet wide. Six or seven feet of these croppings are rich enough in gold to ship to Salt Lake, while the remainder will average $30 a ton. The main working is a tunnel, in now about 530 feet. It was commenced to develop a claim farther up the hill. At 80 feet a 50-foot belt of porphyry was cut through, immediately beyond which ore was found, and, with this exception, the whole length of the tunnel is on the ledge. At about 175 feet in, the ledge is crosscut for 28 feet, all ore which will average $40 to the ton. In this is a streak of about six feet wide which runs on an average five and a half ounces gold to the ton. It is from this streak principally that the 275 tons shipped to Salt Lake since last spring have been taken. The excavation serves to show up the property all the more. This streak is about 75 feet long, and no ore has been taken out of it either above or below the tunnel level. It pitches westward into the Jim Crow ground.

The Jim Crow workings, while not as extensive as those of the Monitor, show up nearly as well. At the edge of the east line a shaft has been sunk 143 feet, all in low-grade ore. This was the first work done.

Yellow Pine District.

A THIRTY-THREE DAYS' RUN.—The gold mill at Keystone, Yellow Pine district, Lincoln county, produced $8000 worth of bullion—the result of a 33-day run.

ALASKA.

A NEW FIELD.—The officers of the steamer Topeka, just from Alaska, report there is considerable excitement at Juneau and Sitka, the result of a rich free-gold quartz find on Chekagoff island of the Aleutian archipelago. Despite the approach of winter many are flocking to the new gold camp.

ARIZONA.

A PECULIAR PROCESS.—Tombstone *Prospector*: The Copper Queen Co. will, in the course of a few months, have in operation works for the extraction of sulphur from the copper, which will be a revelation to many miners in this section. Instead of extracting the sulphur from the ore before smelting, as has been done with the ores coming from the lower levels of the mines at Bisbee, the sulphur will not be eliminated until after the ore has been smelted. The matte will be run through another furnace

which will turn out copper, which, though not wholly refined, will have eliminsted much of the hase substance contained in the metal.

To Be Reopened.—Since instructions were received to increase the force on the railroad hetween Prescott and Phœnix the water in the Congress mine, which has lain idle for two years, is heing pumped out, indicating that work will soon he resumed. The mine was closed to await the completion of the rosd, as the owners clsim they can save $150,000 a year in freight alone over wagon freighting.

Around Prescott.—Prescott *Courier*: In the Chaparral gold mining section, 20 miles sonth-east of Prescott, there are six mills of from 5 to 20 stamps each. There are also no less than 20 producing gold mines, the ores from which range in value from $10 to $300 per ton, and the ledges from ten inches to six feet in width. Within a few miles of these mines is a 250-ton concentrator, a revolving roaster, two 30-ton water-jacket smelting furnaces, thst are supplied by a two-mile-long 20-inch gauge railroad, which runs to the mines, which supply it with ore csrrying copper, gold and silver. Thirty-five miles east of Prescott is the great 300-ton copper smelting plant of the United Verde Copper Co., the ore from the mines carrying a high percentsge of gold snd silver, the hullion ontput heing two carlosds per day. In the Hassayampa district, near Prescott, there are some valuable gold properties, hut most of the mines carry a high percentsge of silver, which latter are of course more or less neglected for the more exclusively gold properties. In Wesver district, tributary to Prescott, there is a ten-stamp mill running on gold ores. This district is noted for its immense output of coarse and high-grade quality of placer gold, many unggets having heen found there ranging up into the hundreds of dollars each in value. In the Martinez gold mining district, 40 miles west of Prescott, is a 40-stamp mill on the Congress mine, which has heen worked to a depth of 1000 feet with all workings in good ore, and has produced $2,000,000. This mine has two ledges, which range from four feet to thirty feet in width.

No Men Needed at Bisbee.—*Prospector*: J. W. Howell came to Tombstone on the 25th from Bisbee, on his way to San Francisco, where he will remain a couple of months. Work at the Copper Qneen mine will run along as at present for an indefinite period. Mr. Howell states that 15 tramps walked into Bishee on the strength of a statement that the company wanted 1000 men. There are more good men in town now than the company can put to work for probably six months to come.

BRITISH COLUMBIA.

Dredger Diggings.—Nelson *Miner*: Some months ago it was announced that a Chicago company had been formed for the purpose of working some placer ground near Elk City by means of a floating dredge. E. L. Galvin of Chicago, who is the superintendent of the company, lately reported progress. The dredge has heen a complete success, handling the gravel in good shape and showing excellent returns.

It was rather late in the fall when the machine began work, and some six acres of ground were handled. The gravel ran from five to seven feet deep, and gave an average return of about $4000 psr acre.

The company is only stocked for $50,000, so that the experimental working will make an excellent showing on the books as a dividend on three months work all told.

COLORADO.

A Bio Boom.—Leadville Cor. Denver *Republican*: Information has just reached here from a reliable source that a boom of large-sized proportions has broken out in connection with Granite gold fields, located a short distance south of the city, the occasion being a rich strike of gold-hearing ore on the Aspen-Brown-Gillespie property. Traimen on the Midland report a crowd variously estimated from 500 to 1000 encamped in the neighborhood of Hartsel. The Granite field has attracted attention for some time on account of the strikes of the yellow metals made from time to time, notably in the Solix Tylec and other properties, hut it has been overshadowed by Cripple creek to such an extent that widespread publicity was not made. In the opinion of many the developments of this new territory will soon begin on a large scale.

The A. Y. and Minnie is shipping 50 tons a day, the reason given hy the mansgement for the size of the output being the amount of water in the mine, which prevents more extensive developments and which would require an amount to remove which the present price of silver does not justify. When the prospects of the white metal improve a heavy output will be the inevitable result, as there is an ore body in sight, the dimensions of which are impossible even to realize.

The Antioch, a gold producer in the Leadville district proper, is employing 30 men regularly and keeping up steady production. The Little Johnny, another gold producer, has been shipping 50 tons daily to the valley smelters and will largely increase its shipments. The Catalpa is also shipping regularly from 25 to 50 tons to the same source. In the Wolcott the new shaft is down 260 feet in wash and lakehed material. The intention is to drift from the new shaft into the old workings. What is known as the Elk fault has broken the formation near this point. The faulting lies between the Capital shaft, the latter having the porphyry and a portion of the lime has been eroded, but the lime has been replaced in places hy parting quartzite and iron and lead ores. This ore, it is supposed, is a portion of the great Maid chute, that, it has been demonstrated, is a westerly trend.

No marked improvements in the smelter situation has taken place. The Bimetallic is running three stacks to their full capacity, and the Elgin also is in active operation. The anticipation of the Arkansas Valley blowing in its ten furnaces is general, but is not yet a settled fact. It will, however, probsbly soon be decided. President A. R. Myers of Kansas City is now here looking over the situation.

IDAHO.

The Sonium Process.—Baker City *Democrat*: A representative of the Boise *Statesman* returned the first of the week from a trip of inspection to the new gold saving machine of the Portland Amalgamator and Mining Company, which was heing operated on Commissioner Paul's place near Parma. Operations now have been discontinued at that point for the winter after a few days run, owing to the freezing up of the small lateral from the Sebree ditch. Mr. Paul is arranging to start it up again on another bar, using a China pnmp to raise the necessary water from the Snake river.

It has long been a well established fact that sodium will so quicken the action of mercury as to amalgamate in considerable bnlk the precious metals upon the least contact almost instantaneously. Although hut a mere particle of sodinm was required to produce this result, yet the effect was short lived, and it necessitated constant application to keep the mercury active. All devices heretofore tried for applying sodium in the work of amalgamation have heen found imprscticahle until Nathan L. Rsher invented the Portland machine.

This mschine, viewed from in front, is an ordinsry looking stairway, or five-stepped terrace. A stream of water csrrying the sand and gold pours over these steps with speed and quantity regulated to the capacity of the machine. These steps, which in themselves are copper in amalgamating plates, are 56 inches long and ahout a foot in width, and inclined at ahout seven degrees to give the desired velocity to the water. In front of each plate, extending the entire length, is a trough filled with mercury. This trough is 2½ inches deep, hut in the new machines will be only half this depth, and is two inches wide. It requires from 30 to 50 pounds of mercury to charge a single trough. The mercnry fills the trough even full in some cases, and in others it is kept a half inch below the top.

The stream of sand and water fall perpendicularly on top of this body of mercnry with force sufficient to insure good contact, but not enough to flour or displace the mercury. This is regulated hy suspending the trough from one to two inches below the edge of the plate. The stream has force enough to concave the mercury a little, to wash over the edge of the trough all sand, and to keep the surface of the mercury cleared so that each drop of water, as it falls, is hronght into contact with the mercnry. It is calculated that the first trough catches 75 per cent of all the gold; the second saves nearly all the rest. The plates catch a little. The other three troughs are a reserve force and catch any mercury that may have been splashed over. From three to six tons an hour will psss one of these batteries with six or seven miner's inches of water.

The secret of the sensitized mercury is yet to be explained. In the hottom of each trough are fastened two porous cells of triangular shape, and each extending ahout half the length of the trough. These cells are hollow and are filled with any solution of which sodium is the hase. Common salt has heen found to be the hest for this purpose. This solution is decomposed with an electric current, and the molecules pass through the walls of the porons cells under the pressure generated. The two metals sodium and mercury, readily amalgamate, and the chlorine passes off as a gas. But even gas passing through a body of mercury will flour it. So the apex of triangular cell extends about a quarter of an inch at the back of the trough above the surface of the mercury. Then the gas, following the line of least resistance, escapes to the surface between the body of mercury and the porous cell.

This decomposed solution passing through the porous cell furnishes a constant supply of sodium that keeps the mercury so sensitized that it will amalgamate even iron pyrites passing over it. The effect of the sodium on the mercury is manifest in the heat that is generated, it heing possible to cause the mercury to hoil out of the trough. A one-horse power dynamo will supply light for ten machines.

The flow of water and sand, the inclination of the plates, the lowering of the tronghs below the plates, the lowering of the mercury in the troughs, the filling of the porous cells with the sodium solution, the regulating of the electric current to the desired number of amperes, the cleaning up of the amalgam, are all done with devices that render the operation of the machine very simple.

The company claim to save all the assay value of the sand or pulp. It is also claimed for the machine that it will supplant all other methods of amalgamation in quartz mills as it is the only method by which loss of a portion of the values can be avoided. In pyritic ore it will amalgamate the gold carried in the pulverized sulphides.

A Novel Scheme.—The search for gold is becoming as widespread as it wss before the discovery of the bonanza silver mines. One miner has recently anchored a hoat ou the bars of Snake river, in Idaho, for the purpose of ohtaining gold from the mud in the river. He provided a number of huckets attached to an endless chain, each hucket capable of holding about 20 pounds of dirt. These are fixed so that they will scoop up the sand and mud and deliver it to a hopper. A small engine suffices to supply motive power. The hopper is agitated hy the engine and a stream of water carries away the refuse. The gold is canght hy an application of quicksilver on copper plates. Three men are employed and about a hundred tons of gravel are handled daily. The work is hard and disagreeable, hut they do not mind that if they can continue to get gold out of the mud.

The Alsska-Treadwell mine, Douglas Island, has a 240-stamp mill. During the last fiscal year it crushed 257,255 tons of ore, yielding an average of $2.13 in free gold. They treated 4584 tons of snlphurets, giving an average of $41.28 per ton. The bullion sold hronght $694,659. The profits were $385,614, and the mine paid $375,000 in dividends.

A Rich Strike.—*Statesman*: A very rich strike has been made in the Homestake gold mine at Neal, a streak having heen opened that is from twenty inches to two feet thick and that runs ahout $500 per ton. K. P. Plowmsn, when sske sbout the strike, ssid he hsd not seen it yet. A teamster brought him the news with a request for sacks in which to ship the ore. The rich stresk, he said, was about 20 inches thick, and those at the mine gnessed the value all the way from $400 to $1000 per ton. This stresk was first met with in an upraise some time ago, where it appeared as a stringer diverging into the footwsll. Recently a cross-cut was started from the tunnel level to find the streak. This intersected the streak on Sunday, after having run seven feet. The discovery is msde about 75 feet from the surface.

A New Gold Saver.—Bntte *Miner*: A Boise, Idaho, man has invented a new device for ssving placer gold. The machine is marvelonsly simple in construction. It consists of a sluice box of ordinary size, into which are set in grooves copper amalgsmated screens. The screens, any number of which may he placed in the slnice, are arranged in sets of three, each set being a foot or such a matter apart. The counter screen of each set is placed in a vertical position and the other two are arranged at opposite angles of ahout 45 degrees each. These screens are placed in a slanting position in order to present a greater surface to the water. In the first set of screens the meshes are ahout 20 in number to the square inch. The meshes are made finer in each succeeding screen until in the last there are 40 to the square inch.

The dirt is first put through a grizzly or a series of grizzlies and the finer particles with the gold pass into the sluice hox and through the first set of screens. Here some of the gold is canght in the meshes of the amalgamated copper wire. As it goes on, passing through the finer and still finer screens, all the gold, so the inventor claims, is saved. In order to make a clean-up the screens are removed and the amalgam hrushed off, the same as in the case of amalgamated plates.

All the flour gold saving devices now in operation depend on their success upon the gold settling to the hottom of their sluices or rockers. The specific gravity of the flour gold is so infinitesimal it will not settle, hut will float along with the sand. The inventor says his patent overcomes that obstacle, it heing almost impossible for a particle of gold to pass through the series of screens without coming in contact with the amalgamated copper wires.

The inventor has given the machines several tests on Snake river with gratifying results, fire assays failing to hring to light any traces of gold in the tailings which before heing put through the machines were known to be thickly sprinkled with the yellow flour.

NEW MEXICO.

At Silver City.—*Enterprise*: The Pacific mill is running on Pacific ore, crushing 25 tons per day with the usual favorable results.

John Brockman's mill at Lone Mountain started up last Monday.

The Walker mill at Pinos Altos is completed and will he started next Monday.

The Manhattan Gold Mining Company paid their employes in full to November last. A full force is at work on the Aztec tunnel and the vein will be cut ere many feet are driven. The tunnel is now heyond the point at which the survey located the vein, hut a slight deviation in the dip of the lode would throw it several feet out of the line.

The Texas mine is keeping up its reputation as a producer. Drifting, stoping and sinking are in progress. A hig body of rich ore was struck this week. The vein is exceptionally large and is highly satisfactory.

Bill McAllister will build a custom mill on the No Hay Nada mine, the property which created such an excitement two years ago. As depth progresses the prospects continue favorable, and as McAllister is an old-time miner, it is presumed he knows what he is doing. He has purchased the old Carlisle mill and he is confident of making a success. The No Hay Nada when first struck was the wonder of the Southwest, large chispas of gold being encountered within a few inches of the surface.

A New Placer District.—*Record*: Within a stone's throw of the town of Dolores, South Santa Fe county, here has heen unearthed a new placer district where 125 men are now at work, some of them clearing up $20 a day in nugget gold. At this point hedrock curls up to within from three to ten feet of the surface and the top earth is stripped off, revealing the gold in quantities well calculated to create a furore.

A nngget worth $4 was found on Tuesday, and on Wednesday a shiny hit worth $2.50 was taken out. Mr. Wilson showed several nuggets worth prohably 25 to 75 cents each.

There are some thirty of those fanning machines known as dry washers and worked by hand power in the new district, and they are doing well. Ahout one-half of the men engsged there are natives. Day hefore yesterday a thrifty fellow crawled out of a hole with two huckets full of sand and gravel and he offered them to a Colorado miner who stood near for $10. The Coloradoan laughed at the Mexican, and the Mexican then put these two buckets full of stuff through his little fanning machine and scraped out full $20 worth of gold dust and nuggets.

UTAH.

A Lively Camp.—Sslt Lake *Herald*: Among yesterday's arrivals from Mercur, Utah's great gold camp, was E. B. Shorthridge, who is in the city sgain for the purpose of negotiating another sale of mining properties. "The excitement is growing daily," he stated to a *Herald* msn, "and the rush to the csmp still continues without abatement. Every stage which enters the csmp is losded with capitalists anxious to get into the swim. They are mostly from Colorado, which State is unloading a great number of men ou to us. As a general rnle they have money to invest and are getting hold of some of the best properties in the camp. On Saturdsy over $100,000 changed hands as the resnlt of leases, bonds and ssles. The Glencoe people are already at work putting up their mill, and all the mines are incressing their forces. The csmp is all activity and is growing with remarkable speed. Many new buildings are going up and preparations are being made for the esrly erection of more. Several cars of lnmber were on the siding waiting to be unloaded when I came down. We have three inches of snow at Mercur, but it does not in the least hinder operations, which csn be continued all winter without interruption. There is a good opening at the csmp for a live assayer who is not afraid of roughing it with the rest. As an example of the manner in which some of us are living, the instsnce of 13 Colorado and Utah capitalists sleeping in a shanty with the snow drifting over them might he cited. Mr. Shoebridge was successful in his deal, and will leave for Mercur this morning."

WASHINGTON.

Notes.—Okanagon *Outlook*: The south drift in the upper level of the Columhus mine is in a fine body of ore. It is said to he fully as rich as any yet taken out of this mine and several tons are being sacked for shipment to the Tacoma smelter.

Chas. Siehert visited the seat of placer mining opsrations on the Similikameen this week, and found everything in a favorable condition. The hoys are still working their sluices and rockers and will continue as long as the weather will permit.

The quartz mill at Oro is running on ore from the famous Allison gold mine on the Similikameen, and most flattering results are reported.

S. J. Sincock, who has heen working on a mining claim up at the head of Toats Coula creek for the past six weeks, returned home yesterday. He brought down about 50 pounds of ore as a sample of the vein, which is six feet wide and all mineralized. Mr. Sincock is highly pleased with the showing made and will have the ore tested. The claim lies in an unexplored district about 16 miles northwest of Conconully, and Mr. Sincock is of the opinion that the lead is but the extension of some of the many large veins running through this camp. The character of the ore is similar and the vein runs in the same direction, varying a little west of north.

John Siehert & Hank Deihl returned yesterday from the Similikameen, where they have been placer mining for the past four months. They have built ahont 900 feet of a wing dam and had just began washing out the gold when a snow storm came on and they were forced to ahandon it for the season. They have everything in good shape, however, and as soon as spring opens will renew operations. The boys are thoroughly convinced that the bar contains gold in paying quantities, and brought down several ounces of the "stuff" to convince the skeptical. It is all coarse gold and many of the particles were as large as pess.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address Dewey & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Bluffkins was sitting in the club-room not many evenings since, when Blake entered and took a seat near the fire.

"I say, Bluffkins, Blake began, "who is that new party Webb tells me arrived at your house yesterday?"

"Birthday party," replied Bluffkins, disconsolately.

"Don't talk nonsense," said Blake, savagely.

Bluffkins looked up in surprise. "I'm not talking nonsense, old man. Never was more serious in all my life. It's the stern truth; it weighs ten pounds, and it's a boy."

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 7, 1893.

The only notable fact in the silver market during the week was an advance yesterday in Loodon and New York. The statement of prices for yesterday and the day previous is as follows:

Mining Share Market.

SAN FRANCISCO, Dec. 7, 1893.

There was a retrogression in Comstock shares in the earlier part of the week, followed by an effort at a slight advaoce later, the amount of business being mostly local. Prices closed a little under the quotations of the previous week.

The meeting between the directors of the Con. California and Virginia Mining Company and Mr. Rule resulted in a mutual agreement as to the form of contract under which he does the work on the 1000-foot level of the old Con. Virginia shaft. The contract is for six months from December 1, 1893. Mr. Rule is to get ten per cent of the net profits of all ore fouod under the workings of the contract, the sum received by him not to exceed $10,000.

Assessments delinquent this month aggregate $161,920; of this amount Nevada mines claim $136,920.

The following mining companies had cash on hand Dec. 1st, as follows:

Alpha, $4711.71; Alta, $3488.45; Andes, $2231.72; Best & Beclher, $6441.91; Bullion, $9953.18; Caledonia, $8149.08; Confidence, $1439.31; Chollar, $4821.57; Con. New York, $4875.69; Con. Cal. & Virginia, $52,657.29; Challenge, $2079.16; Crown Point, $7296.75; Con. Imperial, $1261.73; Gould & Curry, $8592.51; Hale & Norcross, $24,265.87; Justice, $1498.35; Julia, $3206.05; Kentuck, $1498.38; Lady Washington, $1683.74; Mexican, $9339.03; Nevada Queen, $1792.86; Occidental, $596.75; Potosi, $4297.96; Syndicate, $1205.40; Sierra Nevada, $12,518.27; Silver Hill, $885 07; Utah, $2743.23; Union, $20,654; Union Con, $26,754.58.

Of the $24,265.87 of the Hale & Norcross reported above, $21,100.95 was acquired from public sales of stock in the company's treasury, forfeited for non-payment of the recent assessment.

During November the Comstock Milling and Mining Company paid out for labor $61,439 50. This is $3489.75 more than was similarly paid out in October.

Persons receiving this paper marked, are requested to examioe its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, If ordered soon enough. If already a subscriber please show the paper to others.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 21, 1893.

508,906.—STALK CUTTER—W. Allingham, El Cajon, Cal.
509,013.—DOOR MAT—S. Armstrong, Lind, Wash.
509,117.—PAVING MACHINE—R. J. Carson, S. F.
508,920.—PIPE WRENCH—L. Dahlstrom, Santa Clara, Cal.
509,156.—STAMP MOISTENER—H. A. Fry, S. F.
509,077.—SEAL LOCK—F. E. Gstze, Los Angeles, Cal.
509,078.—CURTAIN FIXTURE—C E. Goodrich, Pioche, Nev.
509,161.—CURTAIN FIXTURE—C E. Goodrich, Pioche, Nev.
509,030.—FILE—H. Haustsin, S. F.
509,082.—HARVESTER—J. L. Ifeald, S. F.
509,310.—GAME—W. W. Lapham, S. F.
509,041.—CHUTE—Loyd & Relersen, Tacoma, Wash.
508,961.—COUNTER SEAT—Gen. A. Moss, S F.
509,325.—CAR—T E. Pope, S. F.
509,096.—CALIPERS—C. W. Preston, S. F.
509,274.—STRINGING PIANOS—C. S. Wsbor, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LACE, VEILINO OR RIBBON HOLDAA.—Julius M. Schlesinger, San Jose, Cal. No. 509,691. Dated Nov. 28, 1893. The object of this invention is to provide a convenient device for holding and displaying laces, veiling, ribbon and other similar delicate goods, so that they can be easily displayed and inspected. It consists essentially of a hase or hsses having cylindrical posts at their opposite ends, and thin, flat bolders upon which the material is wonod, having tnbnlar end posts corresponding with those upon the bases and adapted to slip over soch posts or be easily removed therefrom. It also consists of a means for rotating these bolders so that the material may be easily coiled thereon.

FOLDING CHAIR.—George F. Hanson, San Francisco, Cal. No. 509,735. Dated, Nov. 28, 1893. The advantages of this chair are that it is light, yet strong and dnrable, and can easily be folded into small compass for convenient transportation, and as easily expanded for nse, as occasion may reqnire. The chair is composed of a back piece having legs, a second pair of forwardly inclined npwardly divergent legs pivoted near their lower ends to the legs of the back, and a third pair of backwardly inclined nowardwardly divergent legs pivoted to the divergent legs, a sliding hinge connection between the npper ends of the backwardly inclined legs and the back piece, and a suitable seat supported from the npper ends of the four inclined legs.

MITAA-BOX.—Martin Hanson, San Francisco, Cal. No. 509,736. Dated Nov. 28, 1893. This invention relates to what are known as miter-boxes, which are nsed for sawing lnmber at various angles for the jointing of fine and accnrate work. It consists of a horizontal table having a vertical back, a swinging lever fulcrnmed in line with the rear edge of the table adapted to tnrn about said fulcrnm pin so as to change the aogle of the cnt to any desired degree, a spring-actuated locking pin to hold the lever, and a lever by which it is disengsged when desired, saw gnides snpported upon the rear and front ends respeclively of the swinging bar to retain the saw in a vertical position while being nsed. These saw gnides consist of metallic enclosing snpports having replaceable wooden blocks fitted within the snpports so that the surfaces of the wood serve as a gnide for the saw and prevent injnry to its teeth. Snitable locking screws are employed to secnre the blocks in place, and allow them to be easily removed, when necessary, and the tops of the metallic snpports are also covered with wooden blocks to prevent injnry to the sawteeth when the latter is bsing introdnced or removed.

FEADING DEVICE FOR RIVETINO MACHINAS.—Hermann Hahn, San Francisco, Cal. No. 509,732. Dated Nov. 28, 1893. The object of this invention is to provide a means whereby tnbular and other rivets may be fed with regnlarity from a containing box to the point where the rivets are to he nsed. It consists of a tilting box or receptacle for the rivets having a longitndinal slot or opening in the bottom, into which the shanks or legs of the rivets are adapted to fall by reason of the oscillations of the box. The raceway is made with inclined snrfaces having npwardly projecting shonlders at intervals, presente l toward the front of the box, and a plate, the upper edge of which projects into the slot in the bottom of the box, so that the rivets fall npon it with the legs astride of this edge. This npper edge is provided with notches corresponding with the shonlders npon the raceway in the box, and these notches serve as stops to prevent the rivets moving toward the rear of the box, while allowing them to move freely toward the front, so that, as the box is oscillated or tilted ahont its point of snpport, the rivets are gradnally moved forward and delivered from the box to the carrier over which they pass to the point where they are to he nsed.

A FIND ON CAMP CREEK.—Phœnix *Gazette*: A valnable gold discovery has been made about two and a half miles northwest of Mrs. Marlar's place on Camp creek by Messrs. O'Leary & McCav. The ledge is two fest or more in width and very rich. The men are experienced miners, and they believe the prospect the very best for a paying mine. The ore assays $1500 to the ton.

Cal. Debris Commission Notices.

NOTICE—THE CALIFORNIA DEBBIS COMMISSION having received petitions to mine by the hydraulic process from John Spaulding, in the Polar Star mine near Dutch Flat, and to deposit tailings behind a dam in Little Bear River; from Nathan Gardner in the Red Hill mine near Ono, Shasta Co., and deposit tailings behind dams in Wash Pan Gulch; from A. Denmire, in the Denmire mine near Gold Lake, Sierra Co., to deposit tailings in an old hydraulic pit, gives notice that a meeting will be held at the office of the Commission, room 32, Flood Building, San Francisco, on December 12th, 1893, at 1:30 P. M. On or before this hour and date all parties interested may file affidavits, plans and maps, in support of their respective claims. By order of the Commission. W. H. Heuer, Corps of Engineers, U. S. A., Secretary of the Commission.

Assessment Notices.

CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

Notice is hereby given that at a meeting of the Directors, held on the 22d of November, 1893, an assessment of $2 per share was levied upon the capital stock of the Corporation, payable at the office of the company, to the Secretary, on the 22d day of December, 1893.

Any stock upon which this assessment shall remain unpaid on the 22d day of December, 1893, will be delinquent and advertised for sale at public suction, and unless payment is made before will be sold Monday, the 8th day of January, 1894, at the office of the company, at 1 o'clock P. M. of said date, to pay the delinquent assesement, together with the cost of advertising and expenees of sale.

MORGAN BACKUS, Secretary.

Office—408 Sacramento St.

THE

GOLD AND SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

MacARTHUR-FORREST CYANIDE PROCESS.

CAPITAL, £110,000 STERLING.

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST CYANIDE (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

The chief features of this process are

Simplicity, Economy in Working and Small Cost of Plant.

OFFICE:

McPHEE Building, DENVER, COLORADO.

SITUATION WANTED

By a first class mechanic and practical electrician of 20 yeare experience in telegraph, automatic signal, dynamo, gas and steam engine work. Would be valuable as an assistant in developing a new syatem. Mechanic's wages to start with. Address

A. C. ROBBINS,
Watsonville, Cal.

J. F. CROSETT,

628 Sacramento St., San Francisco, Cal.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition an the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is berally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Itis a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, cash, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

PRACTICAL TREATISE ON HYDRAULIC MINING.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, burdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

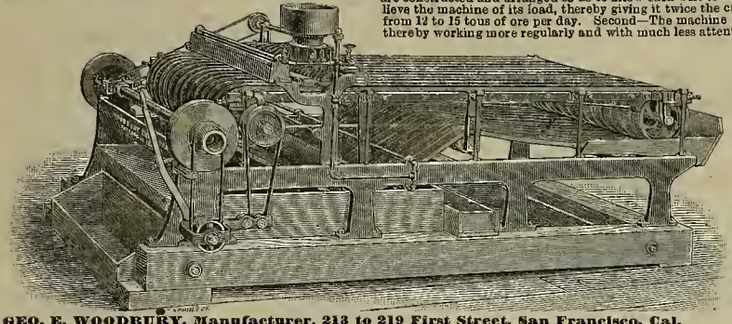
HALLIDIE'S PATENT WIRE ROPEWAY

FOR THE RAPID AND ECONOMICAL TRANSPORTATION OF ORE AND OTHER MATERIAL.

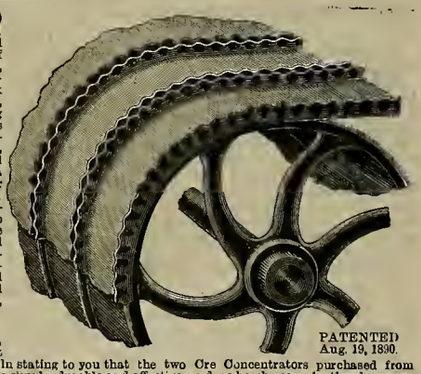
Erected by us during the past Fourteen Years in Spans of from 200 to 2000 feet. Simple, Economical and Durable. Have been Thoroughly Tested in all Parts of the Country.

SEND FOR ILLUSTRATED CATALOGUE.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 1½ to 15 tons of ore per day. Second—The machine equalizes the load by having several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allotted to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.



GEO. E. WOODBURY, Manufacturer, 213 to 219 First Street, San Francisco, Cal.



PATENTED Aug. 19, 1890.

[COPY.]

Eureka Tellurium Gold Mining Company, Redding, Cal., July, 21, 1893.—Mr. Geo. E. Woodbury, 213 First St., San Francisco, Cal.—Dear Sir:—We take pleasure in stating to you that the two Ore Concentrators purchased from you last April are giving perfect satisfaction. They are simple, durable and effective, and we hereby conscientiously recommend the "Woodbury" pattern to all intending purchasers of Ore Concentrators. Yours truly,

[Signed] EUREKA TELLURIUM GOLD MINING CO., by GEO. C. JONES, Secretary.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

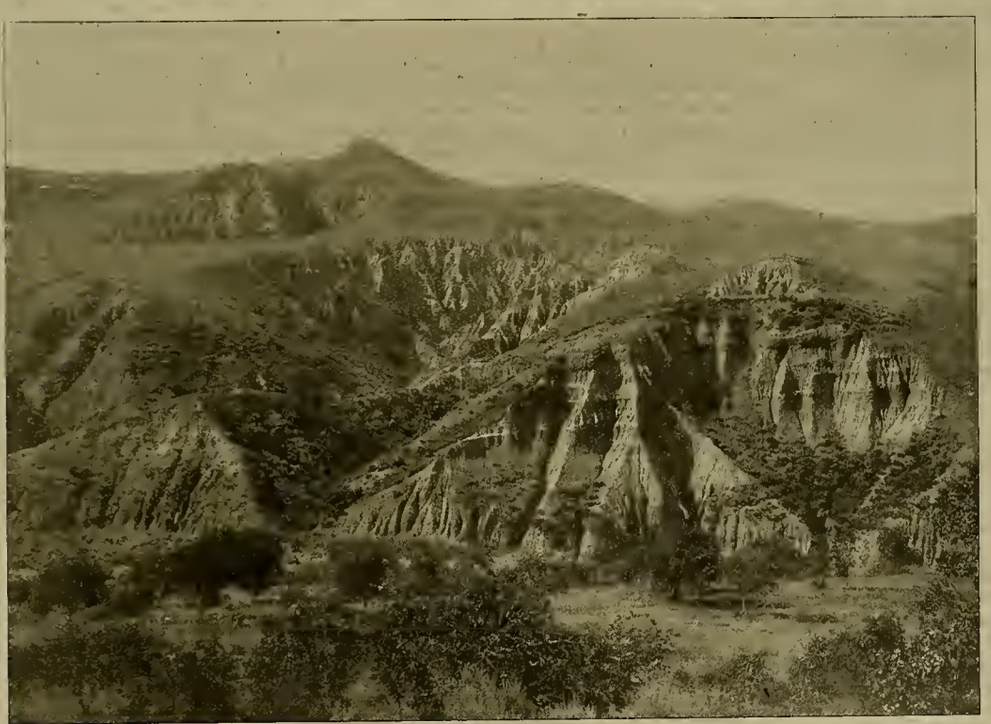
CALIFORNIA

Gravel Cliffs Above Tres Pinos.

Prof. Andrew C. Lawson of the Department of Geology, University of California, is author of a valuable bulletin, just issued, on the "Post-Pliocene Diastrophism of the Coast of Southern California," in which he seeks to establish two things as of great moment in the geological history of California, viz: 1. The uplift or emergence from the ssa of the entire coast of California from San Francisco to San Diego, in post-Pliocene time, to an extent of from 800 to 1500 feet, a very notable epeirogenic event. 2. The local deformation or differential movement of the crust to a very remarkable degree, particularly in the vicinity of Santa Catalina island and near the city of San Francisco, very notahle orogenic events, also of post-Pliocene age. The professor's conclusions are brought about by local excursions along the coast and in the interior. Among other sufficient evidences, Prof. Lawson finds that tbe river valleys fully confirm the conception of the general uplift of the coast. The more important valleys are the Santa Clara-San Bsnito, tbe Salinas-Santa Maria and the Santa Clara of the soutb. Three valleys—the Bay of San Francisco, the Santa Clara and the San Benito—form a single topographic feature, which may be known as the Santa Clara - San Benito valley. Its total length from the Golden Gate southwestward may be placed at 150 miles. The hreadth of its bottom varies from that of a headwater gorge to about 17 miles at the Bay of San Francisco. It has a remarkably straigbt course for its entire length. This valley is occupied by a trenched and terraced Pliocene delta. This fact is not so apparent at the middle of the Santa Clara portion of the valley as it is at its lower and upper portions. The lower portion is partially occupied by the Merced series. The upper portion, from the Pajaro canyon southeastward, reveals the delta in a great volume of approximately horizontal gravels. The Pliocene age is established by their unconformable relation to the upturned Miocene of Pajaro canyon, and by the fact that they contain pebbles of the white, siliceous shale which characterizss the Miocene of the coast. These gravels are exposed on the San Benito, the Tres Pinos and Los Meritos in a series of very remarkable cliffs, often over 1000 feet high, which are being developed by a vigorous sort of sculpture which yields the effects of a "bad land" topography, as shown in the illustration. The trenching and terracing action of the streams, as they have by stages dissected the delta during the progress of the uplift, has left remnants of it in the form of isolated hills and plateaus in the middle of the valley. The hedding is either horizontal or is tilted to the eastward at angles up to perhaps 15°. The altitude of the summit of a gravel plateau was made the subject of careful measurement. By the use of the mercurial harometer the summit was found to be 929 feet above Tres Pinos station. The latter is given in the railway levels at 514 feet above sea level. The summit of the plateau is thus 1443 feet above sea level. It is clear, from the character of the ground, that the summit of the plateau is not the original summit of the delta formation; much has been removed by erosion. Farther up the valley, also, these same gravels are known to the writer to be several hundred feet higher than on the plateau near Tres Pinos. The summit and slopes of the plateau are distinctly terraced at varions levels.

In these facts we have all the evidence that could be desired for the conclusive demonstration of (1) the depression of the coast in Pliocene time during the accumulation of the gravels; (2) the great volume of the Pliocene strata, certainly not less thau 1200 feet; (3) the correlation of the San Bsnito gravels with the Merced series at the lower end of the same valley; (4) the uplift of the valley with its load of gravel, in post-Pliocene time, to an extent uot less than the measure of the altitude of the plateau near Tres Pinos.



GRAVEL CLIFFS OF SANTA CLARA-SAN BENITO VALLEY, ABOVE TRES PINOS.

THE cyanide plant of the Gold Recovery Company is just ready for operation in the Black Hills district. The Deadwood *Pioneer* says: "The completion and opsration of this plant has heen looked forward to hy every one in the Hills, especially mining men, as the solvsr of the problem of treating our low-grade ores, not to be handled by chlorination, smelting or other high-priced processes, at a profit. In the cyanide process the owners of developed mines of low grade see where they can haul their ore, which prohahly would not average $12 per ton, and have it treated at a cost which would leave them a margin with which to live and operate their mines. The successful operation of this plant will increase the mining industry four fold in the Hills within three months after it has demonstrated its practicability to handle our low-grade ores to a profit. It would cause mine after mine containing large bodies of ore, ranging in value from $10 to $16, to be opened up and worked continuously, causing the employment of many men and giving the mining industry a healthy impetus and creating a market for all properties having a vein of mineral. Upon the success of the cyanide process depends in a measure the prosperity of the Hills."

FOLLOWING is from the London *Mining World* of recent date: "Tbe position of the Golden Gate Company may be summed up in a few words. It cannot, from circumstances explained at the meeting of stockholders, use the Feather river at present, but Col. McLaughlin suggests that a valuable ledge called, let us hope by prophetic instinct, Lucky Boh, should be explored, which he has no doubt will lead to profitable results. Mr. Borwick, who has now joined the board, when on the spot examined this ledge, and arrived at the same conclusion as the Colonel had previously done. They are both of opinion that it is better to do this than to do nothing; and when the shareholders heard the explanations that were given they were of the same opinion, and decided upon reconstructing for the purpose of finding the necessary funds. This is the whole nosition, and it is changed from what it was only in this respect, that while by no means abandoning the attempt to work the river bed, the company will enter upon quartz-mining operations which, so far as we can ses, are likely to give increased value to the shares and dividends to the shareholders. A shareholder in the meeting expressed some want of confidence in Col. McLaughlin, but Mr. Pechey, speaking on behalf of the board, stated most emphatically that in this gentleman neither he nor his colleagues had lost one atom of faith. They helieve that circumstances have hsen against him, but that the time is coming when he will prove the accuracy of his statements by the gold he will produce. That is the opinion of the board, and it is ours."

THE Idaho-Maryland mine at Grass Valley has inaugurated a novel method to assist in the disposition of its waste. The available dumping ground had bsen ntilized, and the notion of a hydrsulic elevator, to raise the ore cars to a tramway built over the dump, was conceived and carried out. The framework of the elevator is of heavy lumher, anchored to a concrete foundation. The platform has a lift of 30 feet. The ram is 6½ inches in diameter, and is raised under the natural head of water—530 feet—supplied to the mill. The elevator is supplied with a two-inch pipe, hut it was found necessary to decrease the speed by reducing the opening to five-eighths of an inch. The elevator is controlled hy a simple lever and stops automatically at both the upper and lower landings. Its capacity is three tons.

It is safe to say that the proposed new tariff has more direct effect upon the industries of the country than any proposed since the Morrill tarriff of 1861; and yet, curious to note, the industrial interests of the nation, which have always been exceedingly sensitive to legislation and clamorous against reduction of tariff duties, are now inactive and almost silent. The fruit interest of California is vitally concerned, but it has been unable to raise money to send a representative to Washington in its own behalf. The mineral industry of all parts of the nation is affected, but it has done nothing. The lead-silver mines will be brought into direct and unrestricted competition with those of British Columbia, it is pretty generally believed among miners to the further injury of the industry. The duty on copper is to be removed, and the mines of Montana and Arizona affected, but they do not appear to view the prospect with alarm. California has comparatively little direct interest in these things, but it has in quicksilver, of which it is a large producer, and from which the duty is altogether to be removed. And so the list might be extended at considerable length. Scarcely a voice is raised in protest. The reason seems to be that the party in power is bound to enact a new tariff, and objection will be useless; and there is a sort of negative assent on all sides that the experiment may be tried, so that a demonstration of the workings of a low tariff may be given.

It is said that the coal-fields of Mendocino county are to be developed by Messrs. Flood and Mackay, the owners. The fields are very extensive, and adjoin the coal properties of the Navarro Mill Company, about 40 miles from Ukiah. The exact nature and extent of this property are not matters of general knowledge, but they are said to be such that their development is fully warranted. It goes almost without saying that any field in California which can produce coal in commercial quantities will be a property f immense profit. Almost the whole coal supply of San Francisco comes from the mines of Puget Sound, British Columbia and Australia, and importations from Japan on a large scale have just begun. Henry Villard, organizer and chief promoter of the Oregon Improvement Company, which is owner of several important coal mines near Seattle, once claimed, in an official report, that a fair profit could he realized at Seattle with coal at $2.50 per ton. The cost of haudling and transportation to San Francisco is about $2 more. The average price at the yard in this city for the past year has heen $6.50, leaving an apparent profit of at least $2 per ton. It is evident from these figures, which represent the lowest prices received in this market for any coal (with one exception), that a fine opportunity exists in California for a local coal mine of sufficient extent and average quality of output. The situation has long been perfectly well realized. The difficulty has been to find the coal-field.

The Debris Commission's Report.

The official report of California Debris Commission, from which copious extracts were made in last week's issue of this paper, indicates a state of things that ought to afford a degree of satisfaction to the hydraulic mining industry. The Commission was appointed for the purpose of bringing about a revival of hydraulic mining, if practicable and if compatible with other interests; and it is evident that its members have a clear understanding of their duties and their obligations to the public, particularly to the miners. The report fairly points out the obstacles in the way of resumption by certain classes of mines; and as fairly shows how resumption may be brought about by others.

The chief problem to be solved is, of course, the matter of storage of debris; and the Commission divides the various sites into three, viz: (1) reservoirs in worked-out hydraulic pits; (2) natural sites; and (3) sites in the beds of natural streams. The two first are naturally to be preferred, for they do not involve the filling of streams by detritus, which is the point of controversy. The Commission points out the danger that may arise in extreme cases from the latter method, but really expresses no direct opinion as to whether or not they are to be adopted or avoided. From the general trend of the report, however, the following may be fairly deduced:

Where a natural site or an old hydraulic pit are available for storage they are by all means to be preferred; and, where not, the cases must be determined upon their merits and their separate conditions. Restraining works erected in natural water courses must be made more durable than in dry gulches, or in natural sites, for the obvious reason that they are more likely to give way. If built of wood, they are sure to decay in a few years, and the debris carried off. Permanent restraining works must therefore be erected in such cases, if at all

These things constitute a virtual announcement of a broad rule of conduct for the Commission in determining applications to mine, and they will serve as a partial guide for owners of mines in deciding whether license is likely to be granted. It has been pretty generally understood all along that the only mines about which there would be serious question belong to the third class; and no surprise need be felt at the attitude of the Commission. Its reasons for its position are easily discoverable. It must be remembered that the so-called valley interests have exactly the same recourse—viz., the courts—they had before the passage of the Caminetti Act. The Commission is as fully controlled by the Sawyer and Gilbert decisions as are the miners themselves. The Caminetti Act is not a repeal of the findings of the courts. It is simply a device by which they may be applied for the benefit of the miners. The Commission is hound, therefore, to have always in full view the former action of the courts, as well as the probable action of the same tribunals in case their intervention is demanded.

It is again worthy of comment that no application to mine has as yet been denied by the Commission. About twelve have been granted, and no doubt similar action will be taken in other cases now under consideration. It doub less seems to many that progress has heen slow, but no one acquainted with the situation ever expected that, with the appointment of the Commission, hydraulic mining would spring once more into being, as sturdy and active as when it was killed in 1884. The process must be gradual. On the one hand, it has been necessary for the Commission to determine its own method of operations and to interpret and apply a new and untried law; on the other, the miners have been anxious to learn the attitude of the Commission and the probable scope and effect of the law. The Caminetti Act was an experiment whose practical adaptation to conditions in California must be learned. These things have now been determined in a fairly satisfactory manner, and the way to resume hydraulic mining is clearer than it was before. We may reasonably expect that more will be accomplished in 1894 than during the present year.

The sequel to the riots in the Cœur d'Alene mines a year ago last spring is found in a judgment hy an Idaho court for $11,500 damages, given against the Helena and Frisco mining companies and in favor of Chas. J. Patterson. Patterson was a non-union employe. He was hired about a week before the mill was blown up and claimed that he knew nothing about the danger. While in bed in the new mill a rifle ball cut his ear off, and when he escaped from the mill he was severely beaten. There are over 100 damage suits of this character, hut it was impossible to try them at this term of court. The mining and milling companies have sued Shoshone county for damage to their property, which is an exceedingly large sum and may reach a half million dollars, and they will also endeavor to collect all the damage they sustain by lawsuits because the county did not protect their property.

Needed Changes in Mining Law.

Written for the MINING AND SCIENTIFIC PRESS by M. C. Ihlseng, E. M., C. E., Ph. D., Prof. of Mining Engineering and Assaying, Pennsylvania State College.

I am very glad to see the efforts making to bring about necessary changes in the present mining law. That the condition of the same is chaotic, if not positively unjust, must be conceded hy all who have had any experience with its operation. If I may be permitted to transgress upon your time, I would like to add a few words in the hope that the modifications already so ably argued in your columns may be supplemented by the points I herein offer as simplifying the present conditions of maintaining title

One feature of the law which might be altered with benefit to the prospector and miner concerns the matter and manner of record and identification of the lode claim. It is now incumbent upon all locators to define the boundaries of their claims hy placing stakes at the corners to notify all comers that the enclosed portions of the public domain are entered upon and claimed for mining. The law does not explicitly require their maintenance and if the action of the elements have obliterated these landmarks, there remains no notice to prospectors that the certain ground is appropriated. If a prospector finds a good outcrop and mineral and wishes to locate thereon, he has no warning whatsoever, if the atakes are absent, unless he explored minutely the adjacent territory for a radius of 1500 feet. We all know what a task that would be in slide rock or wooded regions. If he shonld go to the county records nothing there would help him, for the claims are described so indefinitely that the vague outlines and location might apply anywhere. If, after spending considerable time and money in developing his "find," he is notified of trespass, the fact that he has remained for years in undisturbed possession of the ground is of no avail. The original locator obtains the advantage of all such work unwittingly performed, notwithstanding that he has failed to keep up the required stakes.

Again, as to the effect upon one who, in making application for patent, finds himself in trouble because of the contention that he neglected to maintain stakes or had never placed them. Such a fact proven might constitute, and often does, an argument that he had originally intended to locate his claim in a different direction from that now being sought for patent. This suggestion might he elaborated upon in its many phases, but these ought to suffice.

From the frequency of such occurrences, it would seem that Section 2400, requiring the location certificate to contain such a description of the claim as shall identify it with reasonable certainty, should be so amended as to require a survey to be made witbin a few months of the discovery, and the boundaries given in the location certificate, hesides stating the connections from the discovery point to a corner and to a U. S. monument near it.

An addition to Sec. 2402 making the location void unless the stakes are maintsined would improve the condition of the District Court docket.

Now as to the annual assessment. The miner only preserves his right to the claim if he does this required work of $100 annually, or before some one else "jumps" it. I know that the most frequent allegation in adverse suits by the plaintiff is that the assessment work of the previous year or years was insufficient to hold the claim, namely, was less than $100 in value. When this is raised in court, the matter is not easy of proof. Often the labor certificates which are filed are questioned, for there may be ten such annual certificates to prove the expenditure of, presumably, $1000, which should agree with the amount of work actually visible. The total length of tunnel or depth of shaft may be less than would seem to correspond to the expenditure. Stress laid upon this point by the attorneys may bring defeat upon the owner who honestly intended to follow the requirements of the law. This uncertainty should be reduced to a minimum, and the writer's experience as a surveyor prompts the suggestion that the law be altered to require a stated distance per year instead of a specific sum of money. Ten feet of shaft or fifteen feet of tunnel would be a fair average equivalent. In some districts this may be more than an equivalent of the present $100, but in any given county the expenditure would be nearly uniform. Each annual labor certificate might be required to state where the work was done and the lengths before and after the work.

The writer also favors the change of the laws to a universal application of what is, in Colorado, known as the "side line law." Every one knows the various quibbles at law regarding the apex interpretation and bended claims to follow curved outcrops, to say nothing of its effects upon "blind leads." A law which repeals the right of indefinite pursuit in depth may at first sight seem to be against the interests of the miner, but a little consideration of the subject would prove it to be otherwise. There would he less litigation; that is worth remembering. Then

a very steep vein would give the owner a great depth before the vein goes beyond his side lines. It would not pay his neighbor in many cases to sink a deep shaft to catch the extension. Besides, there would be nothing to prevent a discoverer from locating parallel claims on each side of the outcrop discovery and thus cover as much ground as he wants to hold. All the work of assessment to hold the several lode claims could be performed, as now, upon the original discovery. All could be patented together, as now. In flat veins the same could be done, except that the discoverer would locate more adjoining claims, according to the dip.

Such a law would then do away with all trouble over the intersecting lodes and veins, and in every way so simplify the matter that our mining legal fraternity would have no such "snaps" as it has enjoyed these many years.

Hoping that your agitation of the subject may prove fruitful, I remain yours truly, M. C. IHLSENG.

State College, Pa., Dec. 6, 1893.

Too Many Idle Mines.

It is gratifying to notice that in many parts of California men of capital and energy are acquiring possession of quartz mines which have been idle for many years, and are making a systematic effort to reopen them and place them on a dividend-paying basis. The proportion of non-producers which contain pay ore in the list of California mining properties has been altogether too large. There is no important mining district which does not contain one or more mines with fine records as producers, which have from one cause or another been shut down for years. The shafts have caved in, the mines are full of water, the surface works have fallen into decay, and the properties are of no practical value either to their owners or to the community in which they are located. It is not necessary in this place to review the reasons which brought about this deplorable state of things; suffice it to say that the number of good California mines in this condition is large.

The movement for acquiring control of these mines is general. The methods of payment are various, the consideration at times being cash; or the owner takes his payment, or part of the payment, from the proceeds of the mine; or he parts only with a working interest; and so on. It is seldom, however, that a buyer will pay cash outright on the mere history of these mines. They have been shut down so long that statements as to their output do not receive the credence that they perhaps deserve. A buyer wants to see the mine opened up before committing himself to a heavy outlay. He wants to see what ore is in sight, the size of the ledge, the character of ore, and there are many other things he must know for himself. He knows it is unsafe to buy on hearsay; and it is not often that he can be persuaded to do so. In many cases, owners, conscious of the merit and value of their properties, and rich enough to be independent, refuse to entertain any proposition having conditions attached to it; and, as a consequence, many of these mines seem likely to remain non-producers. In other cases, owners are financially unable to do anything with their properties, and are unwilling to enter into any arrangement with others which does not insure them much the largest share of the profits. Naturally, few men are ready to furnish working capital, put up a new or refit an old mill, resink a shaft and drain a mine, without reasonable assurance of remunerative returns, comprising a fair share of the profits.

The common ground on which these two interests may meet is hard to find, and it is difficult to lay down a general rule applicable to all cases. The conditions are always different in different places. But it is probable that at no future time will capitalists be more friendly disposed toward investment in gold properties, or more anxious to acquire an interest in them. It therefore behooves owners to make concessions to the demands of capital, for the time may never be more propitious, and the mines never considered more valuable.

IT has been suggested that the safest way for claimants who give notice that they intend to hold and in good faith to work unpatented mining claims, in order to secure the benefit of the assessment work suspension act, will be for them to have the recorder return their notices after they have been recorded, with his certificate thereon showing that due record has been made. It is not necessary to put up a duplicate or any other notice at the mine. It is probable, too, that the law will be fully complied with if the owner or owners of several mines in one district unite in one notice. Still, separate notices would be better.

THE California Debris Commission met Tuesday and granted John Spaulding, owner of the Polar Star mine at Dutch Flat, permission to work his mine by the hydraulic process. A. Denmire was authorized to build seven small dams below his mine near Sierra City, for the purpose of restraining debris.

Mines on the Lower Colorado River.

IN TWO PARTS—PART I.

How much a dunce that has been sent to roam
Excels a dunce that has been kept at home.

During the past two years the writer, in a professional way, has visited many mining localities and districts of the Pacific coast, from British Columbia on the north and well into Sonora, Mexico, on the south, and the result of these investigations has more firmly emphasized the superior advantages held by the mines adjacent to Yuma. It would be unjust to invidiously compare any certain locality with these lower Colorado river districts, as any one at all familiar with mining will at once see the natural advantages peculiar to the locality herein referred to. It is well to bear in mind that neither "glittering generalities" nor unresponsive, prospectively valuable and untried districts will be considered but demonstrated.

Tangible Paying Mines, in all that the word implies; mines owned or leased by working men—poor men, but who are gradually but surely digging from these mines, if not riches (as the word now goes), a competence, and that in the face of a debased metal, for they are silver mines. To illustrate what has been and what can be done, by muscle and grit and a grubstake earned by polishing drill-heads, take the example of Frank Vomocil. Some envious, less energetic people may call it "Luck;" just prefix P and read it "Pluck"—that's the whole story. Vomocil, about 1886, located the abandoned Eureka district mines and, shortly thereafter, certain deserted Castle Dome mines, after exploring the old working thoroughly. Not a soul lived in either place at the time. Working alone, 14 hours a day, a few months, proved the office mining, heretofore controlling developments in Eureka and ending in disaster, yielded to more practical work, and the mines have been steady producers since and have supported a camp of 40 to 100 people.

The story was repeated in Castle Dome district, others following in the lead set. Vomocil is pretty well fixed now, leasing and supervising his holdings. There is no place in the writer's knowledge where an able-bodied, rustling miner can do better than in "tribute," or leased working, on the "soft ores" of the lower Colorado river, even with silver at 70 cents and lead at $3 50.

We will not consider the old placer diggings at the Pot Holes and Lagunas. There is gold there, but it will not pay for the extraction by the chimerical pump methods attempted, as was publicly foretold by the writer at the inception of pump work, but we will note the first district of importance reached by steamer above Yuma.

The Castle Dome Mining District.—The mines are situated on the flat mesa and rolling hills near the base of a lofty mountain range, here forming a horseshoe curve. A system of three parallel veins cut through the country at the outer points of the curve, with a N. W. and S. E. strike, and at an elevation above sea level of 1800 feet.

They are readily accessible over hard, level mesa roads and "wash," 20 miles from Castle Dome Landing and post office, on the Colorado river, thence 30 miles to Yuma by steamer or wagon road, or to Gila City, a station on the S. P. R. R., all road, and one handling of ore saved—a distance of 30 miles. Present transportation rates to Castle Dome Landing by team are $6; thence by steamer and rail to San Francisco, $9, or a total of $15 per ton; Gila City, $7; team, $8; rail, $15.

The country formation is porphyry. The mines lie in a contact of porphyry and granite, with a dip generally to the east of 45°. The ledges are from two to four feet wide. The vein stuff is decomposed porphyry. The mineral, argentiferous galena and lead carbonates, are in a gangue of fluor and calcspar, with considerable iron oxide. It is a clean smelting ore, carrying no deleterious base material. It is cheaply mined, but little powder required, and that of a "slow," low-grade kind. The ore ranges in value from 20 ounces to 90 ounces silver and 60 to 80 per cent lead per ton.

These mines under the old regime yielded steady, remunerative shipments for about 20 years, when work was stopped at water level, 300 feet in depth. Understand, the veins of this district in no instance "pinch out;" they continue, and in ore where work was suspended. It probably cost ton much at the then price of lead to mine and extract ore 200 and 300 feet deep by hand windlass or whim, though this is the present way of hoisting. Advised by some of the old-time workers in these mines of the location of favorable indications of ore, the present owners have uncovered large ore bodies in virgin ground above water level, and the result is a steady and assured output.

The number of men actually employed at the mines is above 100, and three ore teams steadily on the road. The Hodge Bros. are operating the "Washington group;" Frank Avila and John Stofella shipping from the old "Pocahontas" and "Arkansaw" mines, and a large force on Frank Vomocil's Railroad group of eight claims. Much more could be written of this interesting and thriving camp, but space forbids.

Eureka Mining District.—Twelve miles north of Castle Dome Landing, 42 miles from Yuma, is found the Eureka district and mines. Extensive work was done here before the advent of the railroad to Yuma. It is exceptionally situated for cheap mining. The outside mines are not one mile from the river bank, and those now working not one-fourth mile off.

Here the mountains rise abruptly to greater height than any other range on the lower river, thus allowing economical working by tunnel. The formation is block slate. The ledges are of a width of two to five feet, between firm walls with a strike N. W. and S. E. Gangue matter is of lime-spar and quartz, and a clay gouge or casing on the hanging wall, dipping to the east and under the mountain at 46°. The ore is silver-lead with seams and pockets of iron oxides, and "free" until water level is reached, when some zinc blende is found in seams paralleling the galenite. Water is found at river level. A hand pump handles the inflow in shaft sinking. At present, as in the past, there is plenty of virgin ground to exploit above water level that is responding favorably to "tribute" workers now on the ground.

The ore averages 50 ounces silver, 60 per cent lead per ton. Sufficeth to say the Vomocil group, with the "Mina Alta," an outside strong vein on ore, comprise the mines of this district. They have supported 60 to 100 people, and shipments are regular, for years past, and to-day below Eureka proper, one mile away, Charley Thiesen has a claim from which he has made shipments in times past.

The Azure King Group.—Two miles north of Eureka and a half mile from Steamer Landing is situated the Azure King group of six claims. This is a gold-silver-copper proposition, was worked extensively and ore shipped via the river and Gulf of California to San Francisco in an early day. There are numerous shafts on the vein from 20 to 60 feet deep, in which the notched pole ladders yet in the shafts show the primitive method used in packing out ore and waste on the backs of men in days long since. The mines are situated just within the porphyry mountain range that parallels the river.

The veins have a N. W. and S. E. trend, are two to six feet wide, with a quartz gangue in the talcose-schist vein matter. The copper occurs as a "chalcocite" copper glance; "tetrahedrite," gray copper, sparingly; "cuprite, red copper; and generously of "malachite" and "azurite," or green and blue carbonates of copper. (Hence the name.) Crude hand-sorting of the vein as it runs returned an assay value of: No. 1, gold, $47.54; silver, 15 ounces; copper, 12 per cent; No. 2, gold, $24; silver, 16 ounces; copper, 13 per cent. It is safe to assume an average value of $12 gold; $10 silver, and 10 per cent copper to the ore in place.

These claims will be worked at a profit some day, as they are exceptionally easy of access and free, containing not a trace of arsenic, and can be cheaply mined and treated on the ground. Handsome specimens containing coarse free gold imbedded in malachite are not uncommon.

TAYLOR D. MACLEOD.

San Francisco, December 11, 1893.

Dissimilar Occurrences of Gold-Bearing Quartz.

Abstract of Contribution to Discussion of Mr. T. A. Rickard's paper by Philip Argall, before the Colorado Scientific Society.

The coincidence of the pitch of an ore shoot with the line of intersection of the planes of stratification of the country rock and the lode fissure, appears to me to be an undoubted proof of the favorable influence of certain zones of country rock on the deposition of ore in veins.

Probably no phenomena of vein formation have been more carefully noted or more often described than this "influence of the country rock on the deposition of ores in veins." It may, however, be permissible to quote briefly some authorities bearing directly on the subject.

Muller, describing the Freiberg ore deposits, states: "The lodes in general, without distinction in regard to the character of the formation, have attained a development favorable to mining only within compact rocks, in which feldspar or quartz, hornblende, pyroxene, as also carbon (graphite, anthracite), form an essential ingredient."

W. J. Hemwood, in describing the metalliferous deposits of Cornwall, states: "The lodes are closely related to the rocks immediately adjoining them. Their structure, like that of the rocks, seems in some measure dependent on their mineral characters. * * * * * Most bodies (courses) as well of tin as of copper, have within their respective lodes an endlong dip or shoot, which usually approximates to the contour and bedding of the neighboring granite, and to the inclination of the cleavage planes in the adjacent slates. In each of our several mining districts the lodes are productive on similar lines taken at right angles to their respective directions, hence the phrase, 'ore against ore;' but as the direction of the lodes varies in dif-

ferent districts, the direction of these productive lines is not always the same."

Professor Moissenet, in his extremely valuable publication, also gives this matter a careful analysis, terming the coincidence observed by him the "influence of parallelism, or *vis a vis* of riches in lodes nearly parallel."

J. H. Collins, in describing the lodes of Cornwall, states "that some lodes have copper ore only in slate, and tin ore only in granite, and at the Botallick mine one of the lodes was found to pass three times from granite to slate, or the reverse, containing none but tin ore in the granite, and none but copper ore in the slate."

The classic example of the influence of the country rock on the deposition of ore in veins is found at the famous Kongsberg mine, in Norway, discovered in 1623 and worked almost uninterruptedly since. The silver veins are found most productive in certain belts of rock called fahlbands, which are irregular in their dimensions, the greatest thickness recorded being 1000 feet. They are parallel in strike and inclination with the gneissoid and schistose strata in which they occur, and are subject to the same local disturbance of stratification. These fahlbands are traversed by fissure veins containing silver ores, and long experience has shown that these veins are productive *only* where they intersect the fahlbands.

The example given by Mr. Rickard is interesting, inasmuch as it shows that at least one of the observed laws relating to the deposition of ore in veins in the Northern hemisphere has a further confirmation from the antipodes. It also furnishes an excellent illustration that the aphorism, "ore against ore," is only true when the dip and strike of the favorable beds are taken into account.

I have seen many cases of "ore against ore" in parallel veins in eruptives, an example being the Kapanga mine, New Zealand. Here two parallel veins have the same dip (33°) and are separated by 80 feet of tufa. The ore shoot in the Kapanga vein was found to fairly correspond with that in the parallel Scottys vein, and what is more curious, the rich ore in both shoots ceased to exist at about the same depth from surface, thus, as it were, proving the correctness of the theory ("ore against ore") in both directions. I could not detect any change in the country rock along the course of the veins; the same rock formed the walls of the ore shoots, and also the walls of the unproductive parts of the veins.

The Gymple Reefing Fields, in Queensland, described by Jonathan C. B. P. Searer, are remarkable for the fact that the lodes depend upon the character of different bands of rock they pass through for the extent to which they are auriferous. Bands of black slate occur with diorite and other rocks, and it is in the *black slate* that the lodes contain most gold, being comparatively poor in other parts. Four bands of this black slate are known to exist, and so dependent are the reefs on it that the miners first sink to cut the slate, then drive to where a reef passes through it and start to work the lode at that place.

In the Coromandel mines the gold is extremely bunchy, the vein quartz seldom pays to crush unless free gold is visible, and when it is visible the picked stone is usually estimated at onnces of gold per pound of quartz, instead of per ton; the 2½-ounce-per-ton returns given in Mr. Rickard's paper are not at all unusual. I, myself, have seen many lots of picked quartz that ran from 3 to 5 ounces of gold per pound, and small lots that contained 7 ounces. So coarse is this gold that the mill dirt from rich pockets will seldom run over 2 ounces per ton of rock, showing how easy it is to pick out the gold by hand. The veins are perhaps best described as specimen veins.

Native arsenic occurs very frequently associated with rich gold quartz in the Coromandel district, and arsenical pyrites is very abundant; green chloritic minerals are also common in association with the richest pockets, particularly when the pocket is near a veinlet, dropping in from the hanging wall.

Arsenic in one form or another is concomitant with gold in all the deposits I have any knowledge of, and where arsenical and iron pyrites occur in a gold vein, the former is invariably richer in the precious metal.

Sometimes the arsenic minerals in gold veins are not at all apparent, as for example, in the Gilpin county ores. In this connection Mr. Richard Pearce, of Argo, states:

"In an almost daily examination of these ores for 18 years, I have never seen but one small characteristic specimen of arsenic-pyrite; nevertheless, in roasting Gilpin county ores an appreciable amount of arsenic is always found, so that arsenic may be said to be present in these ores in some form which does not make itself manifest as belonging to any mineralogical species, but rather as an accessory impurity."

Telluride minerals are also found in most gold veins.

It is an undoubted fact that organic matter may act as a precipitant of gold, from its mineral solution. The example given by Mr. Rickard in the "indicator" is as instructive as it is interesting. I would particularly call attention to the enrichment of the quartz in the neighborhood of the graphitic clay seam, which is, I believe, rather unusual outside of Victoria. The series of lodes in California called by courtesy the "mother lode," do not, I believe, show any enrichment in the slates, in diorite or in serpentine. It has been observed, however, that in slate the lode is almost entirely composed of quartz, while in serpentine a considerable amount of gangue is invariably included in the vein.

Professor Silliman has found tellurides of gold and silver abundant in some portions of the mother lode, while he gives the name "mariposite" to a green scaly mineral which is very characteristic of the lode. Ribbon quartz, that is, quartz having alternating streaks of quartz and a dark-colored mineral, is usually richer in gold than the ordinary vein quartz. This dark-colored mineral is itself rich in gold, and is of varying composition. It may be a thin film of slate; very often it is graphitic material, while, according to J. A. Philips, it is in the California quartz veins, sometimes roscoelite and micaceous mineral containing over 28 per cent vanadium oxide.

Black graphitic scale is sometimes, however, unfavorable to the enrichment of mineral veins, an example being the cupreous iron pyrites lodes of Wicklow, Ireland, where the lodes are very bunchy and unusually unproductive in the "coal ground" of the miners. I have very often found pyrites in spheroidal forms in this graphitic shale, and occasionally native copper in the laminæ. In this connection I made some experiments with the mine water (which held copper and iron sulphates in solution), looking toward the reduction of the copper by the shale. My experiments, however, were only successful when the pieces of shale were immersed in the mine waters in contact with pieces of metallic iron. Under these conditions I secured a beautiful deposit of metallic copper on the shale, due, no doubt, to the galvanic current generated.

Commendation for Mr. Edman.

TO THE EDITOR:—Your issue of the 25th ult. contains what appears to be the closing article of the series entitled "Studies in Gold Milling," contributed to your paper by Mr. Edman. I have read all of them with pleasure and profit, and would desire to express my appreciation of the writer's investigations and communications upon a subject which has always been of much interest to me, as to all mining engineers. T. A. RICKARD.

Denver, Colo., Dec. 11, 1893.

Foundry Notes.

THE Mammoth mine of Arizona, near Tucson, has purchased one of the Griffin roller mills. It was to have been started up this week.

THE Union Iron Works is preparing to make a complete exhibit of mining and other machinery at the Midwinter Fair. A conspicuous part of the exhibit will be that pertaining to marine architecture and ship-building.

REPRESENTATIVE MAGUIRE, of California, is endeavoring to have scrap iron and scrap steel placed on the free list by changing their classification in the Wilson bill. They are now classified with pig iron and are made subject to the same duty. Maguire claims, on the authority of iron manufacturers, that scrap iron requires one more heating in the process of manufacturing than pig iron does, and that the additional process is equal in cost and waste to the tariff on pig iron. Several Democratic members of the Ways and Means Committee have expressed themselves as favorable to this view.

MESSRS. GEO. A. WOODBURY and F. A. Huntington are arranging to show at the Midwinter Fair the practical operation of the Huntington mill and Woodbury concentrator. Space 42x22 feet has been assigned them in the Mechanical Arts building, and they will place therein an ore-crusher, ore-feeder, five-foot mill, plates and concentrator, with necessary fittings, all of which shall be in actual operation. Quantities of ore from two to five tons will be milled free of charge, and the full returns of free gold, together with the sulphurets, given to the owners. For quantities above five tons reasonable charge will be made. It will no doubt be one of the interesting features of the mining machinery exhibit.

THE shaft upon which the Firth wheel, at the Midwinter Fair, will turn has been placed in position. It is of cast steel, 12 inches in diameter, 22 feet long, and weighs just 7012 pounds, while with its flanges and the bearings upon which it will turn there will be nearly 18,000 pounds of iron and steel on which the wheel will turn. The diameter of the wheel itself is to be 100 feet, but with a site having a natural elevation of 30 feet above the level of the main buildings, and a foundation 20 feet high, the extreme altitude of the wheel will be 150 feet, and it is from this height that those who ride in the swinging cars will view the surrounding landscape and the great expanse of the ocean. No pains have been spared by Manager F. V. Dubose and his assistants to assure themselves that the wheel shall be absolutely safe. The foundation alone weighs 712 tons, and is composed of rock and cement. The wheel represents 96 tons of weight, and with ten people in each of the 16 cars will carry 12 tons more. The foundation, bearings and supports have already been examined, passed upon and approved by the consulting engineer of the exposition.

CHARLES W. OSBORNE, of Redding, the discoverer of the rich Gladstone gold mine, and J. C. Petty, another well-known California miner, have left for the gold mines of Johannesburg, South Africa. They will go west, instead of east, to get to their new field, and accordingly they sailed on the Alameda, Dec. 14th, on her outward trip, and go to Australia. From there they will proceed to Cape Town.

Sliokens.

PROF. ARCHIBALD B. MCCAW expects to leave in a few days on an important business trip to New York.

As a result of the recent heavy rains the Klamath river rose eight feet. Most of the mining appliances of the river claims were swept away by the flood.

THE Kimberly diamond fields are said to have produced since they were opened in 1870, on an area of two miles square, diamonds to the value of $350,000,000.

THE Gruh Gulch district in Madera county is coming to the front. More men are now at work there than ever before, and the mines are giving excellent results.

THE Poorman mine at Burke, Idaho, has shot down until spring or longer. One hundred and eighty men were discharged and thirty retained on development work.

THE Sutro people propose to have the first mule that ever pulled a car of dirt in the Sutro tunnel on exhibition at the '49 camp at the Midwinter Fair. It is over 30 years old.

THE Green Mountain mine, owned by the Messrs. McSorley, and located in Chili gulch, about one and a half miles from Mokelumne Hill, Calaveras Co., was sold last week for $17,500.

THE Malvina Gold Mining Company has been incorporated in San Francisco. Directors—S. H. Smith, G. W. Osborn Jr., C. F. Bunker, G. W. Waitt and A. Summerfield Jr. Capital stock, $500,000.

THE Kennedy Mining & Milling Company is the largest taxpayer in Amador county, being assessed at $500,000. They pay a tax of $10,000 for State and county purposes and $600 on the Jackson school bonds.

THE following Bodie mining companies report having had cash on hand on December 1st: Bodie, $10,498.28; Mono, $4738.90; Standard, $26,211.18. The following were in debt: Bulwer, $4254.30; Summit, $1054.36.

THE Gladiator Gold Mining Company has been incorporated in San Francisco. Directors—J. E. Doolittle, Joseph Marks, Henry B. Havens, William A. J. Doolittle, J. M. Harper. Capital stock, $1,000,000, all subscribed.

MR. J. C. KEMP VAN EE, manager of the Poorman (Idaho) Consolidated Mines, Limited, has left Silver City for London, to be absent until January 10th. When he returns, the stamps in the company's mill will begin to drop.

THE Seven Devils region in Washington county, Idaho, is attracting a good deal of attention. Some visitors declare it has some of the best copper ledges in the world, and that it is destined to rival the Cœur d'Alenes as a lead-silver camp.

THE Geneva Gold-Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $10,000,000, with R. W. Lamb of Virginia City, and David Fay, W. W. Lent, John Fay and T. J. Mitchell of San Francisco as directors.

THE Nevada Mining and Reducing Company has been incorporated. Principal place of business, San Francisco. Capital stock, $1,000,000, with Albert H. Stratham, W. S. Barton, David Carr, W. J. McFarland and Edward J. Weir of San Francisco as directors.

THE Siwash Creek Gold Mining Company, Limited, has been incorporated in the city of Vancouver, B. C., by C. T. Dunbar, E. L. Phillips, B. T. Rogers, C. J. Loewen, C. St. A. Pearse and M. W. Elphinstone. The capital stock is $500,000, divided into shares of $10 each.

THE Leavenworth Coal Company has been organized, composed of F. A. Loosekamp, J. W. Arthur of Leavenworth, this State, and J. R. Allen of Spokane. The company has bonded a coal mine on Chumpstick creek, a tributary of the Wenatchee river. The amount of the bond is $10,000.

THE Cedar Creek Mining Company has been incorporated. Principal place of business, San Francisco. Capital stock, $1,000,000, with Andrew Rodger of Alta, and Chauncey B. Hutchins, Richard L. Dunn, Donald McDonald and Peter L. Dunn of San Francisco as directors.

THE Morning Star gravel mine of Iowa Hill has just declared another dividend of $1 per share. Besides declaring a dividend, the company has purchased from the proceeds of the mine a large tract of land adjacent to their claim. It is rumored the purchase price of the tract of land was $7000.

THE Halls Mines, Limited, is the name of a corporation recently formed. The mines of the company are located on Toad mountain, B. C., near the town of Nelson, known as the Silver King group, and consisting of five mining claims. The British Columbia office of the company is located at Nelson.

IN the United States District Court at Boise City, Idaho, the remaining Cœur d'Alene contempt cases have been dismissed. The cases included 75 defendants and were for a violation of the injunction of the court restraining striking miners from interfering with miners at the time of the strike last year.

JOHN DIX, a miner, arrived in Juneau a few days before the steamer Al-Ki sailed south, with a pound of coarse gold. He made his "find" on Jacobi island, in Icy straits, 175 miles northwest of Juneau. The gold is found in decomposed quartz, and again much coarse gold was discovered. The discovery is regarded as the best in Alaska for several years. A party of miners left Juneau two weeks ago to locate claims.

THE official guide of the Midwinter Fair will be published by George Spalding & Co. of this city, to whom the exclusive privilege has been granted by the management. It will be a volume of about 200 pages, book form, containing a complete description of the fair—its features, large and small, and, in short, all details connected therewith that may be of interest or value to a visitor. No other guide will be permitted to be circulated within the grounds, or none other has the official sanction of the fair management.

AT noon December 10th the last rail of the first division of the Midland Terminal Railway was laid. The line is a Santa Fe feeder from gold mines of the Cripple Creek district, reaching the Santa Fe at Divide. It is now finished to Midland, midway between Cripple Creek and the main line. Over 500,000 tons of low-grade ore has been held awaiting construction of the line. With only half the line built it will be possible to operate many mines at Cripple Creek, now closed on account of high transfer rates.

The Nevada City Mining District.

EDITORIAL CORRESPONDENCE.

NEVADA CITY, CAL., Dec. 8, 1893.

It is a pleasant thing, in these days of industrial depression, to visit a region which has entirely escaped the recent pinch of hard times, and which is enjoying a full season of prosperity, undisturbed by general outside influences and unequalled for more than two decades in the history of California's mining industry. A new era of development has begun for Nevada county, and the past two years have been marked by activity and great material progress. It has fairly begun to recover from the blow inflicted by the shutting down of hydraulic mining in 1884, and by the subsequent restriction of quartz-mining operations. The distribution of activity, it is true, is yet somewhat uneven, and the roar of the hydraulic giant is still unheard in the great gravel districts, where decayed flumes, idle pipe lines, deserted pits and depopulated towns tell a tale of desolation and ruin melancholy as death. One cannot appreciate the full extent and vital consequences of that bitter conflict which waged for years between the valley and mountain interests until he sees actual evidence of its devastating results. The sentiment of the disinterested was, years ago, largely behind the anti-debris element, because of a widely prevalent and carefully nursed conviction that it was battling for hearth and home. It seems just to have dawned on the public mind that, with victory for the valley people, the blight of starvation descended upon and withered towns, villages and districts whose whole dependence was the life of the hydraulic industry, and that the issue was of the highest moment to them and their people. They were driven from home and fireside and compelled to restore their broken fortunes elsewhere. Their hardships were great, but let us hope their reward will be greater.

These reflections are impressed upon the visitor who makes a tour of Nevada county. The wreck of a great industry is in places the first and almost the only thing he sees. But elsewhere he finds substantial evidences of growth, wealth and happiness, and it is these it is the purpose of this letter in part to review. There are signs of reviving life in hydraulic mining, and it is probable that a few years will witness an approximation to its former dimensions. Quartz mining has in the Nevada and Grass Valley districts experienced a very notable revival, and all parts of the county partake more or less in its benefits.

The salient feature of recent developments about Nevada City is the general movement in the direction of deep mining. It has been demonstrated beyond the possibility of chance that deep sinking is attended by profitable results; and steady downward progress is now being made in several of the important properties of the district. It appears to have been the rule in the district that, when development reached a point in the neighborhood of 1000 feet, barren rock would be encountered, and, in many places, the impression was prevalent that the ledge would pinch out; and it remained for the Providence Mining Company, through its superintendent, Col. Carl Davis, to disclose the real value of the deep quartz. The Mountaineer mine continued sinking its shaft after poor rock was struck, and found pay ore; but the result of its operations does not appear to have been so widely advertised or so directly instructive and beneficial to others as in the case of the Providence.

The history of the Nevada City mining district, following the cessation of hydraulic mining in 1884, was of gradual decay and suspension of operations in the ledge mining. One mine after another shut down, until, about three years since, the only important property being operated on a large scale was the Providence, on Deer creek, one mile west of town. It is true that work was going on in the Champion and in some other mines, but generally on a limited scale. The Champion has been running steadily for some years, but it is only recently that it has assumed the position of one of the leading mines of the district. Because the mine appeared to be gradually working out, and there seemed to be no prospect of a change for the better, operations were suspended on the Providence. After an interval of a year or more, the property changed hands, and vigorous preparation was made by the new company for its active development. The new owners were convinced that there would be improvement in the quartz at lower depths; and they believed also that a different method, or rather direction, of development in the upper workings would prove remunerative. The reasons that brought about this conviction it is not necessary to rehearse; nor, indeed, are they all matters of general knowledge. It is probable that they are to be found in the success of similar methods in the neighboring Grass Valley district; in a general knowledge that deep-mining, properly and intelligently conducted, pays as a rule; and in the absence of satisfactory proof that no ore except that too low-grade to mill, or altogether barren, exists at great depths. Whatever the reasons, they were sufficient for action and for the expenditure of time and much money. The ledge was followed down by shaft and drift, with results most satisfactory to the management and owners. Development in the upper workings, too, has been most gratifying; and there is in sight now a very large surface of pay ore. Thirty stamps pound ore day and night. The sulphurets run from 6 to 8 per cent of the ore, and are treated by chlorination at the company's works. The expense of mining and milling at the Providence is $4.20 per ton. The expense of chlorination is about $10 per ton. The sulphurets carry about 15 ounces of silver to the ton, so that the cost of operation is fully covered by the amount of silver obtained. The exact value of the sulphurets per ton is not given, but it is high. The shaft of the mine is down 1400 feet in the eastern vein, which has an incline of about 40 degrees. The mine has three veins, the "front," "contact" and "slate." A feature of development of the mine is the upraise from the 1250 level to the 600 level. The mill has a steam-plant to be operated in case of failure of the water supply.

The Champion mine rivals the Providence in importance and in extent of operations. Their methods of milling, as well as the capacity of their plants, are almost identical. The feature of the Champion mine is the capacity of its hoisting works, recently installed, to which reference was editorially made in the MINING AND SCIENTIFIC PRESS, December 9th. There is sufficient power to operate the plant at a depth on the incline of 5000 feet, development to that depth clearly being contemplated. The Champion property is very extensive, embracing the Merrifield, Climax, New Years Extension, Müller, Phelps, Ural Relocation, Bavaria, Merrifield Extension and Mary Ann claims. Two parallel veins are included in the property, the eastern being the Merrifield, the western or footwall vein the New Years. Development by tunnel on the New Years vein, coursing north and south, and dipping to the east at an angle of 42°, has been extensive. The tunnel penetrates to a distance of 3000 feet, and attains a depth from the surface of 600 feet. Operations are now confined to the incline shaft and drifts on the same vein, the former reaching a distance of 1250 feet. Sinking is going forward at the rate of 12 feet per week. It is said that the former hoisting works will be used for development of the Merrifield vein.

Other important mines, upon which much the same manner of development as in the two foregoing is going ahead, or will occur, are the Nevada City and the Mountaineer, these four generally being given by local miners as the best instances of the now well-established axiom that deep mining pays. It is now undoubted that in the future work in the district no mine will be considered worked out until sinking has taken place to depths lower than now reached; and it is likewise undoubted that the successful examples of these mines will establish the method of mining for the future. There are a number of idle mines about Nevada City which are now encouraged to resume operations. They were operated in former days, but have—many of them—been idle for years. The early paying mines include such as the California, Banner, Cunningham, Deadwood, Federal Loan, Gold Tunnel, Lecompton, Italian, Mohawk, Murchie, Oro Fino, Pennsylvania, Sneath and Clay, Stiles, Union, Wigham, Willow Valley, Mattingly, Charronat, Grant, North Star, Potosi and many others. Some of these were famous as producers. Most of them turned out ore running from $5 to $100 per ton, and more. Apparent failure of the ore is by no means the sole cause of their suspension. Inefficient management, quarrels among owners, inducements to go elsewhere, all contributed their share. Their reopening is fully justified by their records, or by the precedent of mines now operating.

It is not the purpose of this article to enter into a detailed account of the workings of mines in this district. That service has been very fully and thoroughly performed by other correspondents. One or two mines are used as types and their leading features taken as subjects for discussion. The mining and milling systems at the Providence and Champion mines are efficient, systematic and economical. The controlling principle of operations is to obtain a maximum of results at a minimum of expense. Chlorination is an essential part of milling operations, the ore being uniformly highly sulphuretted. Both gold and silver are saved, and the loss is reduced to a very low fraction. At the Champion mine there is a roasting furnace 60 feet by 11, with a capacity of 12 tons. The total time occupied by a charge from its entrance to its withdrawal from the furnace is four days. Less time is occupied at the Providence, owing to a difference in the ore. The characteristic difference between Nevada City and Grass Valley ores is in the heavy sulphurets of the former. At Grass Valley the average is perhaps not above one per cent. In the Idaho, sulphurets run one-half of one per cent. The ore in both districts is free-milling, and generally high-grade. Other points of difference worth noting are the larger size of the Nevada City veins and the uniform dip of the ledges, somewhere in the neighborhood of 40 per cent. The geology of the district is varied. At the southern portion, adjoining the Grass Valley, it is diabase. This gives way to metamorphic slate. Nevada City stands upon a formation of syenitic graoite. A belt of graoite comes in from the northwest, strikes down Woods ravine, crosses Deer creek west of town, and passes south to Gold Flat. Extending farther east, it strikes Banner mountain, and, turning north, crosses Willow valley. The quartz veins of the district are large size—from two to six feet. The sulphurets consist largely of pyrites, with chalcopyrite, galena, and bleode in considerable quantities. Their value runs from $100 to $300 per ton.

Drift mining is now extensively followed along the Washington ridge, northeast of the city. In several instances operations have been conspicuously successful, and have proven a strong incentive to others to undertake similar development. The activity in drift mining on a large scale has taken place almost altogether within the past three years. The mines which have so far yielded best returns are the Harmony and West Harmony. No better brief description of this important district can be given than that contained in the recent report of the State Mineralogist, from which the following is condensed:

The elevation, or ridge, terminates at Nevada City. The channel extends west of that point nearly two miles, a great portion of which has been worked by the hydraulic method, the stripping, or erosion, of the volcanic capping rendering this method especially applicable to this portion of the channel. From the "Sugar Loaf," just north of the town, at the base of which the elevation of the ridge commences, up the ridge for a distance of over four miles there is a succession of mines. In configuration the ridge is very long and narrow, extending from Nevada City to the northeast some 20 miles into the Washington district; its width varies from one-half to one mile.

The ancient river channels appear to follow quite closely the course of the ridge; or, in other words, the ancient rivers, whose beds lie inclosed, appear to have followed quite closely the direction of the modern streams, which have eroded on either side and produced the ridge. From the Manzanita mine, at Nevada City, it is doubtful whether the gravel channel could be profitably worked in its course up the ridge by the hydraulic method. This fact is due to the deep capping of volcanic material above this point. As nearly as could be ascertained, the bedrock underlying the ridge has an elevation of 2650 feet in the Odin mine, increasing gradually in its course up the ridge. The elevation of the suspension bridge at Nevada City is taken at 2440 feet. The strata of gravels, sands and clays deposited by the ancient river have a depth of about 200 feet; above this the volcanic capping lies, with a depth of 300 or 400 feet. The bedrock is a soft, decomposed granite, containing hard bowlders varying in size from a foot or two up to 40 or 50 feet in diameter. These bowlders are sometimes intensely hard, costing as high as $12 to $16 per foot to drift through them. The gravel stratum profitably worked by the drift process is that lying directly upon the bedrock. Its character varies from a fine, free gravel, that admits of the perfect extraction of the gold by sluicing, as was found in the Live Oak and Nebraska claims, to a hard, cemented gravel, found in the deep channel in the West Harmony mine. In the Harmony gravel large quartz bowlders are found, in many of which gold can be plainly seen. But in all these graduations the gravel proper is composed almost entirely of quartz pebbles, fine dirt, and quartz cobbles. Whenever found in the channel proper the gravel is of high grade, yielding from $2.50 to $13 per ton. The gold occurs in coarse shots, for the most part disseminated through; no find of nuggets of any size has been heard of by the writer. The gold works its way into the soft bedrock, and in breasting the top six inches is taken out with the gravel. The depth of the gravel stratum extracted varies from 2 to 5 feet in the various portions of the grounds. It is a somewhat noteworthy fact that all the mines at present in operation are attacking the channels by means of incline shafts with varying angles, the bedrock tunnels extending from the bottom thereof into the channel. This is done in order to avoid a very long tunnel, which would be necessary if opening by tunnel alone were followed, and, secondly, to avoid the cost of driving through the excessively hard ground that would be met with when going through the high rims. The tunnel into the Cold Spring ground, though very small in size, cost as high as $16 per foot for a long distance. There is little or no water in the ridge; the amount in most mines is trifling, and is readily handled by an ejector using but a few inches of water. By sinking incline shafts easy ground is met with all the way, great speed is attained and the channel is intersected and prospected without the large outlay and long delay that would be occasioned by long bedrock tunnels or probably extremely hard ground. If the channel is found and gravel exists in anything like paying quantities, the high grade can readily stand the small additional cost of extraction due to hoisting and pumping, the less expensive tramming, furthermore, effecting this in part. A peculiarity noticed in the method of working was the use of augers to put down holes in the bedrock. At times this becomes stiff and tough, making work with the pick slow and laborious and drilling with hammer and drill slow. By means of sharp augers holes can be bored very rapidly, and by using powder quick progress can be made. It is stated at some mines that a reduction in the cost of labor of nearly one-half is effected. Ejectors, or hydraulic elevators, are used to free these mines of the small amount of water that they make.

The Nevada City channel has proved a very rich one in past workings. The Live Oak and Nebraska claims, worked out in the 60's, yielded heavy returns to their owners. It is stated that 3000 feet of this channel yielded $4,500,000. Since the cessation of operations in these mines no systematic work has been done, and the rich channel was not discovered until met in the Harmony mine. It is stated that the Harmony gravel at present returns $10 to $13 per ton when crushed in stamp-mills. It is claimed that, with proper economic working, gravel yielding $2 to $2.50 per ton will pay expenses.

These mines seem certain to be a permanent factor in the wealth of the district.

The result of all this development about Nevada City has been a very large share of prosperity for the town and district. The residents are careful to tell a visitor that the district is experiencing no "boom," but is simply enjoying the legitimate expansion which its merit has always deserved. As a consequence, all branches of local business are healthy; work is plentiful, money easy, and there is no poverty. The daily life of the inhabitants is pleasant, their means of social and intellectual enjoyment being varied. There is an excellent public-school system. The various leading church denom-

lnatlons have respectable representation. There are two good daily papers and two excellent hotels. There are water, gas and electric light works. Salonns are less conspicuous than in most mining camps. The people as a whole are intelligent, spirlted and very cordial. Public order is well maintalned.

It may not be amiss in this connection to refer briefly to the early history of the camp, whlch experienced more than the usual share of vicissitudes, and which has triumphed over them in a manner highly characteristic of a resolnte and generous people. It is the invarlable fortune of communities which depend for maintenance wholly or largely upon one industry to be elevated to great heights of prosperity and equal depths of depression. In other words, the history of the industry is the history of its followers. Nevada City has, therefore, thrived best when gold quartz mining has brought large returns; when the industry was neglected the town was lifeless and stagnant. The town was located in 1849 by home-seekers whn wandered into the mountains and found there a pleasant vale, with water, grasses, timber and apparently rich land in abundance. In 1850 vast impulse was given to the life of the struggling settlement by the discovery of gold quartz in the Coyote lead, immediately following a similar discovery at Grass Valley. In 1850 there was a population of 6000. Buildings were rude, the manner of life unconventional (characteristic of the early mining camps), but on the whole the population was more than usually law-abiding for those primitive days. In 1851 fire destroyed nearly all the business portion of the lively town, and it appears thereafter to have been fatally liable to similar disasters. September 7, 1852, twelve buildings were destroyed by fire. In 1855 there were two fires, infilcting damage to the extent of $50,000. The fiercest and most destructive conflagration in the history of the town occurred July 19, 1856, when the whole settlement was devoured by flame. Besides a very large number of frame structures, 22 "fire-proof" buildings were wiped out. Ten lives were lost, nearly all of leading citizens. Another fire ln 1858 destroyed $200,000 of property. In Decemher, 1852, heavy rains made transportation difficult, and even impossible, and no supplies could be obtained. Flour was $40 per hundred, beef 40 cents per pound. At another time a big reservoir in Deer creek broke, during a period of high water, and a cataclysm of water came pouring down the ravine, washing sawmills and all other impediments erected by civilization from its path. The damage was $100,000. Notwithstanding these severe misfortunes, the town flourished untll the breaking out of the Comstock excitement, early in the '60's, when much of its population deserted to the new field. Other events of importance have, of course, occured since then, notable among which was the completion of the Nevada county narrow gauge railroad from Colfax, in 1876. But the foregoing are snfficient to indicate the various difficulties which have impeded the progress of the town and district, and which it has in turn successfully overcome. There ls much of human interest in the struggle for existence of this indomitable mountain metropolis—much that demands both sympathy and admiration. But it cannot be more than referred to in this necessarily hasty and inadequate sketch. The populatlon of Nevada City is now about 5000. There is good reason to expect that there will be further material development in the near fnture, and that the scale of mining operations will be very much enlarged. E. B. P.

Revival of Mining.

That hydraulicking will be in force again, and at an early date, is now almost a certainty. The impounding of the debris by the aid of restraining dams will soon be proven practicable, and the cost of the construction of the dams is not as expensive as at first thought. To this new lease of life credit is due John Spaulding, who applied and was granted permlssion to build a dam at his Polar Star mine at Dutch Flat. It is now nearly completed and we learo on good authority that it will he accepted. Messrs. Benyaurd and Heuer, of the Debris Commission, inspected the dam last week and intimated that it would be satisfactory. If this experiment proves a snccess there will be many such dams erected during the next year. It is the foundation of a boom in mining circles. The estimated cost of the Spanlding dam is about $1500. An evidence of the life that is brought into a mining camp by even one mine was witnessed at Dutch Flat this week by an Aubnrn *Herald* man. Thirty men were employed on the Spaulding dam and thirty men left town in the morning and returned at night, dinner bucket in hand.

That there is yet millions of gold in these parts has heen demonstrated this summer at Dutch Flat. A great number of Chinamen, and a few white men, have been mining in the river beds on either side of that once-famous mining camp, using only the historlc rocker, bucket and pick and shovel. They have all made good wages, averaging from $3 to $10 a day. The heavy storms and the natural settling of the heavier material upon the bedrock have made it profitable to mine by this prncess. A thousand men, we believe, could now make good wages mining in this simple way in the vicinity of Dutch Flat, and we predict that in another year that section will assnme the aspect of the early days.—Nevada City Transcript.

The Wilson Tariff Bill.

Portions of the proposed Wlson tariff bill, in features affecting the mining and mineral industries, are as follows:

Article.	McKinley Law. Rate.	McKinley Law. Ad Val Equlty.	Wilson Bill. Rate.	Wilson Bill. Ad Val Equlty.	Decrease.
Marble and Stone.					
Marble, rough or squared	65c per cu. ft.	46.83	40c p. cn. ft.	30.82	16.01
Veined marb., sawed, dressed, etc	$1.10 per cn. ft.	55.54	75c p. co. ft.	37.87	17.67
Manofactures of marble	50 p. c.	50.00	30 p. c.	30.00	20.00
Burr stones, manufactured	15 p. c.	15 00			
Freestone, granite, sandstone, and other building stone, except marble	11c per cu. ft.	35.86	20 p. c.	20.00	15 86
Do. dressed or polished	40 p. c.	40.00			
Grindstones	$1.75 per too	12 69	$1.75 p. ton	12.69	
Slates, mantels, aod manofactures of slates	30 p. c.	30.00	20 p. c.	20 00	10.00
Roofiog slates	25 p. c.	25.00	10 p. c.	10 00	15.00
SCHEDULE C — METALS AND MANUFACTURES OF:					
Iron and Steel.					
Chromate of Iron	15 p. c.	15.00			
All other Iron ore	75c per ton	30 40			
Iron in pigs, kentledge, spiegeleisen, ferro-manganese	3-10c per lb	30.48			
Ferro-silicon	3-10c per lb	34.51	22·5 p. c.	22.50	12 01
Scrap iron and scrap steel	3-10c per lb	47.89	22·5 p. c.	22.50	25 39
Bar iron, rolled or hammered, in flats not less than 1 in. wide nor less than ⅛ of 1 in. thick	3-10c per lb	35 07	30 p. c.	30.00	5.07
Round iron not less than ¾ in. in diameter	9-10c per lb	60.00	30 p. c.		30.00
Square iron not less than ¾ in. square	9-10c per lb	60.00	30 p. c.		30.00
Flats less than 1 in. wide or less than ⅛ of 1 in. thick	1c per lb	63 01	30 p. c.	30.00	33.61
Rouod iron less than ¾ in. and not less than 7-16 in. diameter	1c per lb	63.61	30 p. c.	30 00	33.61
Square iron less lhan ¾ in. square	1c per lb	63.61	30 p. c.	30.00	33.61
Round iron in coils or rods less than 7-16 in. diameter	1 1-10c per lb	50.96	30 p. c.	30.00	20 96
Bars of rolled iroo not especially provided for — slabs, blooms, loops, etc.	35 p. c.	35.00	25 p. c.	26 00	10.00
Rallway bars of iroo or steel, T-rails	$13.44 per ton	56.00	25 p. c.	25.00	31.44
Rallway bars of flat rails, pnnched	$13.44 per ton	42.00	25 p. c.	25.00	17,00
Tin plates, terne plates and taggers tin	2·2c per lb.	75 61	40 p. c.	40.00	35.61
Sheet iroo or sheet steel, polished, planished or glanced	2½c per lb.	40.76	35 p. c.	35 00	2.76
Do. thinner than No. 10 and not thinner than No. 20 wire gauge	1·25c per lb		35 p. c.	35.00	
Do. thioner tban No. 20 and not thinner than No. 25	1·35c per lb		35 p. c.	35.00	
Do. thinner than No. 25	1·65c per lb		35 p. c.	35.00	
Steel ingots, blooms, shafts, pistoo rods, saw plates, etc.:					
Valued at 1c per lb	0·4c per lb	45.97	25 p. c.	25.00	19.03
Valued at from 1c to 16c per lb	0·4c per lb	42 00	25 p. c.	25.00	17.00
Vained at above 16c.	0 7c per lb	30.27	25 p. c.	25.00	5.27

Alabaster, amber, catgut, coral, jet, spar	25 p. c.	25.00	25 p. c.	25 00	

Part of articles placed on the free llst are: Amber, unmanufactured. Antimony. Articles of growth, produce and manufacture of United States when returned after having been exported, without having been advanced ln value or improved in condition. Asbestos, unmanufactured. Asphaltum and bitumen, crude. Bismuth. Blue vitriol, or sulphate of copper. Bullion, gold or silver. Charcoal. Chromate of iron or chromic ore. Clay—Common blue clay, in casks, suitable for the manufactnre of cruclbles; clays or earths, unmanufactured, not specially provided for. Coal, anthracite, bituminous, and shale, and coal, slack or culm. Coke. Coal tar, crude, and all preparations and products of coal tar, not colors or dyes, not specially provided for. Cobalt and cobalt ore and oxide of cobalt. Coins, gold, silver and copper. Copper, imported in the form of ores. Old copper, fit only for manufacture. Regulus of copper and black or coarse copper and copper cement. Copper ln plates, bars, ingots or pigs and other forms not manufactured. Copperas, or snlphate of iron. Diamonds and other precious stones, rough or uncut, including glaziers' and engravers' diamonds, not set, and diamond dust or bort, and jewels to be used in the manufacture of watches or clocks. Emery ore. Feldspar. Fossils. Glass, broken, and old glass which cannot he cut for nse and fit only to he remanufactured. Hones and whetstones. Iridium. Iron ore, including manganiferous iron ore; also the dross or residuum from burned pyrites and sulphur ore, as pyrites or sulphuret of iron in its natural state. Magnesia, sulphate of, or epsom salts. Magnesite, or native mineral carhonate of magnesia. Magnesium. Magnets. Manganese, oxide and ore. Mica and metallic mineral substances in a crude state, and metals unwronght, not specially provided for in this act Minerals, crude or not advanced in value or condition by refining or grinding, or hy other processes of manufacture, not specially provided for in this act. Nickel, nickel oxide. Ocher and ochrey earths, slenna and sienna earths, umber and umber earths, not specially provided for in this act; dry. Ores of gold, silver and nickel and nickel matte. Paraffin. Phosphates, crnde or native. Plaster of paris and sulphate of lime, unground. Platinum, manufactured, and vases, retorts and other apparatus, vessels, and parts thereof, composed of platlnum for chemical uses. Plumbago. Potash, crude, carbonate of, or "black salts.' Caustic potash or hydrate of, including refined in sticks or rolls. Nitrate of potash, or saltpeter, crude. Sulphate of potash, crude or refined. Chlorate of potash. Murlate of potash. Quicksilver. Salt in bulk and salt in bags, sacks, barrels or other packages, but the cnverings shall pay the same rate of duty as if lmported separately, provided, that if salt is imported from any conntry which imposes a duty upon salt exported from the United States, then there shall be levied, paid and collected upon snch salt the rate of duty now provided by law. Soda, nitrate of or cubic nitrate, chlorate of and sulphate of, or salt cake or nitre cake. Sodinm. Stone and sand, burr stone ln blocks, rough or mannfactured, or bound up into millstones, cliff-stone, unmanufactured; freestone, granite, sandstone, limestone and other building or monumental stone, except marble, unmannfactnred or undressed, not specially provided for in this act; pumicestone, rottenstone and sand, crude nr manufactnred. Sulphur, refined, lac or precipi-

tated, and sulphnr or brimstone, crude, in bnlk, snlphnr ore, as pyrites, or sulphnret of iron in lts natural state, containing in excess of 25 per cent of sulphur, and sulphur not otherwise provided for. Sweepings of sllver and gnld. Tin ore, cassiterite, or black oxide of tin, and tin in bars, blocks, pigs, or grain or granulated.

The Big Trinity County Ditch.

The following excellent description of the big ditch of the La Grange Hydraulic Gold Mining Company, ln Trinity county, is from the Weaverville *Journal:*

When ln the fall of 1892 Mr. Fred Beandry of Colorado, anticipating unfavorable action to silver by Congress, turned his attention to "gold mlning," and, incidentally hearing of the extensive deposits of gravel in Trinity county, he at once determlned to examine into their merits more fully, and, wlth a mlning experience of 35 years in the States and Terrltories to guide hlm, he came here last winter after having investigated a nnmber of fine properties in Wyoming, New Mexico and Arizona, as well as other sections of this State. After carefully testing several fine properties, he decided to purchase the property of the Trinity Gold Mining Company, located chlefly on Oregon mountain and gnlch, snme three miles northwest nf the town of Weaverville. It is therefore due to Mr. Beaudry's energy and good judgment that a new era has been inaugurated in this county, as by his influence a large amount of forelgn capital has been invested in gravel mines, resulting in upward of $200,000 in cash, belng actually expended since the first day of August last, in the way of betterments and the cnnstruction of a dltch, which latter will rank among the finest hydraullc enterprises ln the State.

Associated with Mr. Beaudry in this enterprise is Baron Ernest de La Grange of France, who, with the former, deserves much merit for carrying on the enterprise, as these two gentlemen are practically the owners of the stock, having advanced all the money out of thelr own means and forming a close corporation of the La Grange Hydraulic Gold Mining Company, which is incorporated under the laws of the State of Colorado, with a capltalization of $5,000,000, shares of par value of $1 each, full-paid and nonassessable.

In the face of apparently insurmountable obstacles these gentlemen, who are respectively general manager and president of the company, and in spite of the many predictions that the ditch would be a failure, after a careful survey by Messrs. W. S. and H. L. Lowden, mlning and and clvll engineers, determined to go ahead with the construction of the ditch, and on July 27th the contract was let to Messrs. Rouse & King, an experlenced firm of contractors from Colorado, who undertook to complete the work by the first of next December.

The ditch, which is taken out about 11 miles above the mouth of Rush creek, a fine and perennial stream of large and ample capacity, has a length of 15 miles; its course is for the first two miles sontheast, thence southwest, and it runs along the foot of Bally mountaln and its precipitous spurs, terminating on the summit of Oregon mountain. At the initial polnt on Rush creek there is a tunnel 225 feet long, 5 feet by 7 feet in size. Next comes a tunnel of 148 feet under "Snow-slide creek," while another of 156 feet passes nnder Coal creek, one of 804 feet through the divide of Brown's and Little East Weaver creeks and one through the divide of Sydney gulch and West Weaver creek 785 feet ln length, or a total of 2118 feet of tunneling, part of which through hard rock will give an idea of the magnitude of the work. These tunnels have a grade of from ¾ lnch to 1 inch to the rod, and the 804-foot tunnel is timbered almost its entire length with heavy and substantlal timbers, resting nn heavy sills and well mortised.

Nearly seven-elghths of the entire ditch is in rock work; the banks have a slope of one to three, and a grade of 144 feet to the mile, while the dimensions are seven feet at top, four and one-half feet at bottom and four feet deep, the carrylng capaclty belng 3000 inches or 60 cublc feet per second of time.

There is about one mile of dltch lined with one-lnch boards, and there are six flumes, six feet wide and four feet deep, constructed of 8x10-inch sills, 4x6-inch posts, and caps and sides and bottom out of 1½x2-inch lumber, the flumes measuring 290, 95, 32, 148, 92 and 210 feet respectlvely in length.

There are substantial waste gates every mile along the line of the ditch, six feet wide and four feet deep, and in order to avoid rock and snow sllides the dltch is covered at different polnts along its conrse, to the extent of some 5000 feet, with boards and planks, so as to prevent sllides from filling up the ditch, some 250,000 feet of lumber belng used ln the latter's construction.

Decldedly the most interesting features of the ditch, however, are at East Weaver and West Weaver creeks. At the former, ln order to avoid abont two and one-half mlles of rough and very expensive rock work, a pipe line was constructed, measuring 28 inches in dlameter and 1681 6-10 feet in length, with a depresslon of 400 feet, while at West Weaver the diameter of the pipe is 26 inches and length 2260 feet, the depresslon being 540 feet, whlle the construction of five miles of very difficult ditching has been avoided thereby at this point.

The plpe is Nos. 4 and 8 steel. At each of the inlets of the pipes there is a tank provided, 22 feet long, 12 feet wlde and 9 feet deep, canstructed ln a very substantlal manner with 2-loch plank and 6x10-inch and 6x12-inch timbers, whlle at the bridges the sill timbers measure 18x20 lnches square, and the spans over East and West Weaver creeks measure respectively 65 and 85 feet, being heavily trussed, and securely anchored and bolted to solid rock foundatlons. The lnlet of the East Weaver pipe line is 60 feet above the level of the ontlet, while that of the West Weaver ls 150 feet above the outlet, thus affording a large pressure for discharge at the latter, which are provided wlth ample outlet boxes so as to prevent washing or damage to the ditch.

The inlets are protected wlth guards, preventiog any large objects from entering the pipe, and automatic air valves are fitted on the upper portlon of the lnlet, to prevent the pipe from collapsing in the event of accidents, should the water be drawn suddenly from the pipe from any unforeseen cause.

Manholes are also provlded at different points to permit examination of the pipe from the inside, if necessary; in fact, all the lmprovements known to modern hydraulic science are applied to insure efficiency and safety in operatlng the ditch.

The weight of the columns of water in these immense pipes is tremendous, but the construction of the bridges and extra heavy gauges of steel used in the pipe and fine workmanship on the same is a sure guarantee of their ability to stand the pressure for many years tn come. The difficultles in excavating the trenches on hillsides at an angle of from 30 to 45 degrees, and mostly in rock, must be seen to be properly appreciated.

The pipe is coated throughout, inside and outside, wlth an extra fine quallty of asphaltum; and, having been pumped full of water, the gauges show 170 and 200 pounds pressure to the square inch respectively, nnt a seam or joint showing a slgn of leakage, being perfect in every respect.

The LaGrange Company ls also making extensive improvements in fitting up the mine, employing some 30 men for that purpose and expending some $15,000 to $20,000 in that dlrection alone. This work is in charge of O. M. Loveridge, Esq., an old placer miner of some 25 years experience, and his assistant, C. E. Goodyear, who has been associated with the former during the past ten years.

The reservoir is being enlarged to about 2½ acres, a large amount of new ditching, using about 100,000 feet of lumber for new flumes and blocks and some 4500 feet of 15, 18 and 22 inch steel pipe, ls also being added to the 2000 feet already in use; and last, but not the least, two latest improved glants of six and eight-inch nozzles with an 18-inch inlet have been added, making the equipments of this property first-class, complete and second to none in California.

As the pressure will be 300 feet, lt will be seen that the capacity and duty of the water will be lmmense, and that the ample supply of water now assured the company by means of its new ditch will insure economical removal of the gravel at a mlnimum of cost. The dumpage facilities of the gravel banks are the very best to be found in the State.

The contractors have employed from 300 to 400 men steadily since the 1st of last August, have purchased nearly all thelr supplies from local dealers, and deserve much credlt for the energy displayed by them in pushing the ditch to completion, the character of all their work being first-class in every detail.

When completed, the ditch will cover about 5000 acres of aurlferous gravel, and the LaGrange Company own now, including their nriginal purchase, 3000 acres of some of the richest gravel in the county. It is an exceedingly valuable property, certalnly one of the richest in the State, and with good management—whlch is assured the company under Mr. Beaudry—there is no reason why it should not pay handsome dividends for many years to come. Every detail of the work has been done under Mr. Beaudry's experienced supervision.

The long-dlstance transmisslon of power was first bronght prominently before the public by the experimental line constructed between Lauffen and Frankfort two years ago. The power of the Lauffen Falls was converted lnto electricity, transmitted 115 mlles to the Exposition at Frankfort and there operated a number of motors. The distance was beyond the limits of commercial success, but it demonstrated the possibillty of the system. To-day plants are in operation and transmitting current for light and power at Walla Walla, Hartford, Portland, Pomona and Tellnride. The distances vary from four to thirteen miles.

Explosions in Coal Mines.

At the annual meetiog of the British Association held at Nottingham last month, Prof. H. B. Dixon opened a discusslon on the above subject wlth special reference to the dust theory. The question, he said, was one that had attracted very great attention, aod mining engineers had shown themselves ready to welcome and make use of the results of the researches of chemists and others. Explosions in mines were attrlbuted to two substances—fire-damp and coal-dust. That fire-damp and air could produce disastrous explosions was known, and many investigations had been made on the rate of transmission of the explosion and other points. Many held that mixtures of coal-dust and air were explosive and a source of great danger, whlle others contended that while such a mlxture was inflammable, it was not explosive and the flame died out after traveling a short distance. Another vlew was that if air containing fire-damp, in quantlty even too small to be detected by the ordinary method, should in any way become mixed with fine coal-dust the mixture was highly explosive and dangerous. As early as 1864 it was held that coal-dust might be a source of explosion if set on fire by an explosion of fire-damp, and in 1870 to 1875 many small explosions took place in France, which were attributed to the explosive properties of dust alone. Vital showed that a blown out shot might raise a cloud of coal-dust, and that if this dust were very dry and fine it would explode, the violence being greatly increased by the presence of fire-damp. Galloway, ln 1876, made experiments that led to the concluslon that coal-dust mixed with air was not inflammable *per se*, but became explosive when mixed with one per cent of fire-damp. Later experiments, however, led him to the conclusion that certain kinds of coal-dust were explosive when mixed wlth air alone. The great explosion at Seaham Colliery was in all probability mainly, if not entirely, due to coal-dust, since the explosion did not travel along those galleries in which there was no dust, or where the floor was damp. This explanation was, indeed, the only one that was in agreement with all the facts. Reference was made to the experiments of Sir Frederick Abel, which seemed to show that a mixture of fire-damp and air was inflammable in presence of non-combustible dusts, such as fine sand. In 1882 the Chesterfield commlttee came to the conclusion that, although mixtures nf coal-dust with air alone were inflammable, there was little or no concussion, and the flame did not travel any great dlstance. The combustion of dust alone was never of an explosive character, but the presence of coal-dust was capable of greatly increasing the explosibility of small quantltles of fire-damp. A Prussian committee, in 1887, practically confirmed Galloway's results, and also found that the use of what are called high explosives might give rise to dust explosions. These conclusions were disputed by a French committee, and Mallard and Le Chatelier contended that dust and air, though inflammable, were not explosive, and did not become explosive, unless mixed with more than five per cent of fire-damp. These results were not ln accord with those of other observers. An Austrian committee came to the same conclusions as Galloway and the Prussian commlttee, but pointed out that different coal-dusts differed greatly ln inflammability, and attention should be glven to the nature of the explosives used for blasting, and especially to the character of the fuse. The statement that explosives did not travel through damp parts of a mine was confirmed, and it was recommended that explosives should be localized and isolated by always keeping certain sections of a mine damp. Recent experiments by Mr. Hall showed that different coal-dusts varied enormously in their degree of inflammability, and that mixtures of some dusts with alr were violently explosive if lgnited by means of a large flame, snch as that produced by a blown-out shot or by a small explosion of fire-damp. The great variation in the properties of coal-dusts probably accounted for the difference between the reports from different dlstricts. Whether it was true that coal-dust and alr alone were explosive, or that the presence of small quantities of fire-damp was essential, must be shown by further investigations on the nature of the dust from different mines, the methods of detecting very small quantities of fire-damp, the degree of danger attachlng to the use of different explosives, and the efficiency of various methods of laying the dust ln mines by waterspray, etc.

THE famous stage ride of Horace Greeley with Hank Monk, of which so much has been said and sung, will be commemorated in Nevada's exhibit at the Midwinter Fair by the presence of the old Concord coach which Doc Benson of Tahoe vouches for as being the identical vehicle in which Horace was taken through "on time."

Mechanical Progress.

Metal Cross-Ties on Railroads.

Speaking of metal railroad ties generally, it may not he amiss to recall the fact that they owe their origin to French thought, haviog been proposed some 30 odd years ago by the French engineer Vautherin. Little was done, however, with the early Vautherin sleeper, since it was soon found to but inadequately meet the requirements of actual service, and to increase rather than decrease, as iotended, the expense aod trouble of track maintenance. About 700 of the ties were laid on one of the small German railroads in the year 1867, hut were replaced after a short time by the conventional wooden variety. In 1874 new experiments were made on the same line with somewhat thicker metal ties. About 25,000 of them were put down, and in the main proved quite satisfactory, some of them being probably still in place, so that the trials on the whole may be said to have been successful. Since 1877 the number of metal tie designs has grown apace, and for several years past there has been an embarrassing variety from which to choose, each type of tie of course being claimed to be the best by its designer, while few of them could boast of actual time-trled performance as a fair measure of worth. Probably the best results abroad with metal ties have been obtained with what is known as the Heindl tie, which has been in continued successful use for about ten years on several German and Austrian railroads. None of the defects of frequent fracture of the ties themselves and of rapid deterioration of the road-bed on which they are lald—defects which are said to have been prominent on some lines where they were used, notably in Belgium—have there been observed, and the conclusion has heen reached on these lines that the superiority of the metal tie over the wooden one is definitely established. On one of the Austrian railroads—the Kaiser Ferdinand Northern—a strictly comparative series of trials were made on a long length of road, and extended over the full period of nearly ten years above noted, two parallel sections of line being equipped, one with the Heindl ties and the other with ordinary wooden ones. The traffic conditions on both of the sections were practically identical; the expense records, which were carefully kept, showed, as the result of the several years of observation, a materially decreased expense account for the metal tie section. At the same time the metal ties, after the full period of use, were found to he still practically as good as new, while the competing oak ties were in a much deteriorated state, notwithstanding the fact that they had been treated with chloride of zinc, ao admittedly excellent preservative.—Cassier's Magazine.

Length of Tubes.

Boiler tuhes determine in a great measure the length of the boiler, the diameter of the tube being the determining factor, when we are after greatest economy, says the *Tradesman*. It is considered good practice to make the tube length about 48 to 50 times the tube diameter, and so with four-inch tubes for soft coal we would have tubes and boiler about 16 to 18 feet long, and this will give greater economy than when it is shorter. A longer boiler will also decrease the efficieocy, as the heat will have been pretty well extracted from the tubes by the time the flame and gases have passed through 16 feet of four-inch pipe. After this the heat should be used for heating feed-water or superheatiog steam.

For hard coal the tubes are usually made smaller and the boilers are shorter in consequence, the increased number of tubes giving the additional heating surface, and the smaller tube usiog up the heat (if it can be so stated) sooner than in the case of the large one. These little things go to make up the efficient design of a boiler and should be well studied by those interested in boiler design.

It is not safe to assume all of the heating surface of the tubes as efficient in making calculations (unless they are spaced further apart than usual); and if we do we are apt to overrate the capacity of our boilers, which is not good practice, as then they are more apt to he forced beyond their capacity in order to come up to the rating.

With small tubes it will be hest to allow 15 square feet of heating surface to a horse-power; but for large tubes, amply spaced, it is only necessary to allow 12 feet of heating surface to the horse-power.

Testing Steam Gauges.

It is very much to be feared that but very few steam gauges are correct throughout the whole range of the scale, as they will vary more or less at different pressures, says *Machinery*. In testing a gauge to ascertain its correctness, it is always as well to make the pressure at which steam is usually carried the most important point to he determined. A gauge may be all right at low pressure, and not right at higher pressures, and the reverse may be found, especially with gauges that have heen in use for some time. By many it is not considered advisable to use a gauge for recording pressures as high as that shown on the dial, for few springs will stand such an extension without hecoming permanently set, to a certain extent, and especially is this the case with the cheaper gauges. It is not a difficult matter to devise means for comparing with a test gauge, as any kind of force pump will serve the purpose, and in the absence of a special pump the boiler feed pump can bs utilized. Gauges can he tested by fitting them to a piece of lead pipe, a gauge at either end, the pipe being bent to hring the gauges vertically. The pipe should be filled with water, and then inserted between the jaws of a vise, when screwing upon the vise will bring pressure to bear on both gauges. This is, perhaps, as convenient a way as any, providing the lead pipe can be obtained, for in the absence of a vise a lever can be applied which will serve a similar purpose. An occasional test of a gauge should be made, if its indications are to he relied upon, and it is better to keep the pressure gauge in good order, and be certain that it records correctly, than to depend on the safety valve, whether of the lever or spring type, for these, also, are liable to improper working, if not given proper attention.

New Form of Writing Telegraph.

Donald Murray, a journalist of Sydney, N. S. W., has devised a form of writing telegraph based on the typewriter, says *Engineering*. The message is printed by type keys both at the transmitting and receiving ends. One line is used hetween the instrument, in spite of the fact that so many different characters can be transmitted and printed at the far end of the wire. Clockwork and synchronizing devices are not used; but the depression of a key at the sending end transmits along the wire five short positive and negative currents. At the receiving end of the line is an interpreter, which, according to the particular combination of signals sent, releases one or the other of a number of contact keys, which operate relays working the type keys.

Ancient Girders.

It has been proved that iron T-girders were nsed by the Romans in construction before the Christian era. Some tons of broken T-girders of that metal were found a few years ago during the excavation of the great *cella soliaris* of the baths of Caracalla in Rome. These girders had been cased in brooze, and they were arranged so as to form square panels, which were filled in with concrete, decorated with mosaic and delicate stucco relief, colored and in gilt, thus forming a strong and richly decorated flat ceiling, with a span of great width.

The Latest Plate-Glass Machine.

It is stated that the Pusey & Jones Co., Wilmington, Del., have just completed a new plate-glass rolling machine for the patentee, J. W. Bonta, of Scranton, Pa., which, it is expected, will be very effective in the manufacture of plate glass. According to a recent description, this machine consists of a very strong iron bed or carriage about 15x40 feet in dimension, mounted on car wheels and arranged to move over tracks laid in front of the melting and annealing furnaces used in glass works. Above this carriage, and moving on friction rollers, is a bed or table nearly as wide and ahout one-half as long as the carriage, which in operation moves rapidly from one end of the carriage to the other. The movable bed is composed of two very solid and perfectly level plates lying with the level surfaces together, one-half lying on the friction rollers of the carriage and the other supported at its center by hubs projecting from housings at the center and one end of the carriage. One of these hubs is attached to a lifting nut and screw fixed in the center housing; the other is the hub of a big worm wheel carried by a similar nut and screw fixed to the end housing. By operating these lifting screws the upper half of the bed is raised or lowered at the will of the operator. When it is lifted the lower half can he sent under the roller to the forward part of the carriage and is ready to receive the molten glass. When the glass has heen poured on the level surface of the hed thus exposed, it can be shot back under the roller and under the suspended half of the bed. This is at once lowered until it rests upon the rolled surface of the glass; the two plates are locked together, raised and reversed so as to bring the unrolled surface of the glass up, are again separated so as to expose this unrolled surface, aod the glass is again sent under the roller.

Scientific Progress.

Antidote for Mercurial Poison.

Those who are interested in meteorological instrument factories and other industries in which mercury is extensively employed will rejoice in the discovery of an effective antidote for mercury polsoning, says the *Optician*. Mercury and its compounds are universally known to have a most injurious influence on the human system, and the shake, the shortness of hreath, the slckening pallor, the llstlessness and semi-stupefaction of operatives who are daily subjected to its fumes are sadly familiar. Much has been done to improve the health of the workmen by means of ventilation and improved machinery and pumps, but still the evil exists to a serious extent. Slight cases are usually and quickly cured hy change of air or of work, but if not taken in time the trouble may end fatally. It is not always, however, that a workman can afford either to take change of air or turn his hand to a new employment, and here the new remedy comes in.

Some four years ago one of the partners in a large Parisian incandescent lamp manufacturing firm became salivated while experimenting with mercury pumps, and he cured himself completely by means of small doses of iodide of potassium dissolved in milk. He next administered slmilar doses to some workmen in his lamp factory, who were suffering from mercury poisoning, and they qnlckly and completely recovered. In his present factory, into which he moved a year ago, there has not been a single case of salivation, and this exemption is attributed to the fact that doses of the lodide have been continuously administered to the workmen. Men from other factories have been taken in who on entering exhihited the characteristic signs of mercury poisoning, and who recovered forthwith. The dally dose supplied by the firm to each man is 25 grammes of the crystallized salt dissolved in about 400 cubic centimeters of milk. It has heen suggested that an improvement in practice would be to increase the dose in snmmer, when cases of salivation are much more frequent, and to diminish it during the cooler months of the year; but the present method appears to meet all requirements, and the distressing malady is now robbed of its terrors. We have mentioned meteorological instrument factories in this connection, but it seems to be a moot point, both with masters and men, whether mercurial poisoning is possihle under the condltions in which mercury is here used.

Why the Smoke from the Bowl of a Pipe is Blue and That from the Mouth, Gray.

Smoke, says London *Tid Bits*, consists of minute particles of solid or liquid matter suspended in the air, and its color depends partly upon the chemical constitution of such particles, but also largely upon their size. Exact experiment has shown that as the size of minute particles suspended in air is gradually increased, they give rise to colors varying from sky blue down through the whole range of the spectral scale. This is the cause of sunset and sunrise colors in the sky. Its effects can also be traced in the case of the two kinds of tobacco smoke, modified hy the murky tints of the carbonaceous products. The smoke given off from the heated surface of the burning tohacco in the bowl of the pipe consists of matter, all of which has been highly heated and very fully oxidized and decomposed. It consists mainly of exceedingly small solid particles, exhlbiting by virtue of their smallness a blnish color. On the other hand, that smoke which has been drawn through the tobacco into the mouth of the smoker carries with it a relatively large quantity of water and hydrocarbon, which are condensed upon the solid particles above mentioned. The relatively large size of such particles explains the well-known grayish color of the smoke which issues from the mouth of the smoker.

The Sense of Taste.

Strictly speaking, with the tip of the tongue one can't really taste at all, says the *World's Progress*. It you put a small drop of honey or of bitter almonds on that part of the mouth, you will find, no doubt to your great surprise, that it produced no effect of any sort; you only taste it when it begins slowly to diffuse itself, and reached the true tasting reglon in the middle distance. But if you put a little cayenne or mustard on the same part, you will find that it bites you immediately—the experiment should be tried sparingly—while if you put it lower down in the mouth you will swallow it almost without noticing the pungency of the stimulant. The reason is that the tip of the tongue is supplied only with nerves which are really nerves of touch, not nerves of taste, proper; they belong to a totally different main branch, and they go to a different center in the brain, together with the very similar threads which supply the nerves of smell for mustard and pepper. That is the way the smell and taste of these pungent substances are so much alike, as everyhody must have noticed; a good sniff at a mustard pot producing almost the same irritating effects as an incautious mouthful. When one is trying deliberate experiments on the subject, in order to test the varying sensitiveness of the different parts to different substances, it is necessary to keep the tongue quite dry, in order to isolate the thing you are experimenting with, and prevent its spreading to all parts of the mouth together. In actual

practice this result is obtained in a rather ludicrous manner, by blowing upon the tongue between each experiment with a pair of bellows. To such undignified experiments does the pursuit of science lead the ardent modern psychologist.

Freaks of Memory.

There are on record many remarkable cases of loss and subsequent recovery of memory, says the *World's Progress*. Dr. Abercromby records the case of a four-year-old boy who was injured in the head and underwent trepanning. On recovery the boy absolutely forgot all about the accident and the operation, and when he had reached the age of fifteen had a fever, during which he gave his mother an exact description of the operation and of every one who was in the room at the time, even to the very clothes they wore. In the intervening ten years the subject had never been referred to by the boy, even in the slightest way.

The story is well known of the aristocratic English boy, Montague, who, stolen when a child, was brought up as a chimney sweep, and, being one day employed to sweep the chimneys of his ancestral halls, descended through the flue into his own former nursery, recognized everything in the room, and made remarks which led to the restoration of his birthright.

After Sir Walter Scott had completed the "Bride of Lammermoor" he had an illness, and on recovery he was given a printed copy of the work. "Why," said he, "who can have written this? I had intended to handle this subject myself." Nor could he recognize any paragraph in the story.

An office-holder, whose position was practically a sinecure, his entire duty being to sign his name, happened on one occasion to have to sign so many documents that toward the end of the task he literally forgot his name, and could not for the life of him continue to write it.

An attache of the German army at St. Petersburg went out one morning to make a round of social calls, and on his going into a house where the servant, not knowing him, asked for his name in order to announce it, the diplomat forgot it, and had to turn to another visitor for aid. This ludicrous predicament had something of a parallel in the case of Sir Henry Holland, who spent several hours exploring a mine in the Hartz mountains, and, getting faint from fatigue, forgot every word of German, in which he had been conversing with his guide. Sir Henry could not recollect enough German to make the request that he be taken out of the mine, and not until he came to the surface and enjoyed a good lunch did he recover his command of the language.

Dr. Dwight tells of a girl who preached a sermon while asleep, and mentioned a date when she would deliver another discourse. On awakening she knew nothing about it, yet upon the exact date she had fixed she again preached in her sleep.

The familiar instance of Mezzofanti, who, after a long illness, forgot everything except the use of his native language, is another remarkable example.

Sir Walter Scott's hero, Guy Mannering, came back, as we know, to the scenes of his early boyhood, and was so reminded by what he saw of a forgotten past that he said things which caused his recognition as the long-lost heir.

To turn to the lower animals, a story is told by Sir Robert Clayton, who put out to grass at Knavesmire, in Yorkshire, an entire troop of cavalry horses, part of a regiment disbanded after its return from the continental wars, intending to let the animals pass their remaining days in peace. One day a violent storm came up, and loud peals and vivid flashes rent the air. The old war horses ranged themselves side by side with the same ranks they should have formed had the scene been the battlefield and their masters in the saddle ready for the fray.

Curiosities of Science.

The weight of a molecule of hydrogen, as given by an eminent authority, says the *Chemist and Druggist*, is approximately 0.000,000,000,000,000,000,000,04 of a gramme; multiplying this inconceivably small number by 55, the atomic weight of iron, the weight of a molecule of iron is ascertained — 0.000,000,000,000,000,000,000,002,2 gramme. In the sulphocyanide test we are able to detect the presence of thirty-three ten-millionths of a gramme of iron; dividing this number by the weight of one molecule of iron, we find that this apparently delicate test is unable to indicate to our senses a less number of molecules than 1,500,000,000,000,000.

Do Ants Talk?

A writer in the *Magazine of Natural History* asks whether ants talk, and relates that he saw a drove of small black ants moving apparently to new quarters. Every time two met they put their heads together as though they were chatting. To investigate the matter he killed one, and the eye-witnesses of the murder hastened away and laid their heads together with every ant they met. The latter immediately turned back and fled.

Metallurgy and Ores.

SELBY
SMELTING AND LEAD CO.
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
— AND —
ASSAY OFFICE.
Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.
—MANUFACTURERS OF—
BLUESTONE. LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
— ALSO MANUFACTURERS OF —
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.Co. BATTERSEA

Having been engaged in furnishing the supplies since the first discovery of mines in the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.,** Battersea, England. Also for **E. C. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

Books on Working Ores.
BY GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition an the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.
This rare book on the treatment of gold and silver ore without quicksilver is lberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. His a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco
By C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

LIGHTNING LARGEST **WELL MACHINERY** Works.
All kinds of tools. Fortune for the driller by using our Admantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

The Explorers' and Assayers' Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
BY J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Useful Information.

Air and Consumption.

A writer in the *Century* recommends deep breathing with arm exercise as a preventive of consumption. There is no doubt as to the efficiency of this course, for consumption, except in imported cases, is unknown in high altitudes, the air being so light that deep breathing is mechanical. Few of us use our lungs to their full extent. The practice of trades and callings that require close attention has given to many of us a slight stoop and a falling forward of the shoulders that confines the lungs, while the lack of robust exercise to stimulate the physical mechanism leads to a faint panting that goes nowhere near chest deep and that continues in sleep. We cannot all be soldiers, sailors, hunters and blacksmiths, but most of us can straighten up at our work now and again and give the starved lungs a full drink of air. Exercise, except in some incidental way, such as the mountain climber, the fisherman or the sportsman encounters in pursuit of his hobby, is so tiresome that few can persevere in it. Sparring and kicking at the atmosphere, bending and reaching at nothing, require more than ordinary courage and method to continue for more than a week. It may be all right in theory, but in practice it is a tedious nuisance. An occasional full breath involves no hardship and puts the body to no strain, and probably the results are as efficient as much exercise.

One fertile cause of consumption, and perhaps, if statistics were obtainable, the most fertile of all causes, is the breathing of stale air. Our shops and offices are poorly ventilated, and our homes, particularly in winter, are worse. There are housewives to whom sunlight is poison and fresh air is dangerous. They go about their parlors in a twilight, breathing the peculiar mustiness of carpets and upholstery that they save from fading at the cost of their health and that of their families, and they grow bleached and yellow and twice as susceptible to ailment as those who live a more normal life. If it were not for broken windows and rickety doors in city tenements and out-door occupations by day among the farmers, the ravages of phthsis—foolish spelling, that!—would be much worse than they are; for there are thousands of people who shut themselves into their rooms at night as hermetically sealed as may be. The smell of those rooms in the morning, charged as the air is with animal exhalations, is horrible.

A strange and wholly unaccountable notion prevails among such people, who are usually of the illiterate class, that night air is unhealthy, so they collect a few cubic feet of day air in their bedrooms and breathe it over and over again until it is fairly rotten. The continuance of life under such conditions is a marvel. Night air is the same as day air, except that it is cooler and fresher, and with the subsidence of industry it has less of gas, dust and smoke in it than the air of noon. It is, therefore, the fittest air to breathe that there is, and he who denies it to his lungs at night denies one of his greatest needs and invites the speedy corrosion of his lungs. Thus it is that in farming districts, where rugged health ought to prevail, we see stooping shoulders and pale faces and hear rasping coughs. Let the air in everywhere; let us have more of it in our places of work, let us have more of it in our theaters, especially let us sleep in it. Breathe it heartily to the bottom of the lungs, and there will be no more consumption.

Origin of the Fan.

The origin of the fan in China is said to have sprung from the following incident: A royal princess, very beautiful, was assisting at the feast of lanterns, her face covered with a mask, as was usual. The excessive heat compelled her to remove it, and in order to guard her features from the common gaze, she moved it quickly to and fro in front of her face, thus simultaneously hiding her charms and cooling her brow. The idea was at once adopted throughout the kingdom. Catherine de Medici carried the first fan from Italy ever seen in France, and in the time of Louis XIV the fan, covered with jewels, was worth a small fortune.

The First American Glass Works.

It was only 116 years after the discovery of America that the first glass works was established in the colonies, says the *Popular Science Monthly*. It was a modest venture in an industrial way, but one to which much importance is attached, since it was the starting-point in that interesting history which it is the purpose of the present paper to outline, and still more because it was the first industry started by Europeans on American soil. It thus heads a list which is to-day certainly as long as human needs, and almost as long as human desires. It is a list which has been nearly three hundred years in making. This was in the year 1608. The pioneer glass house was a part of the activities at Jamestown. The spirit of the London Company was distinctly commercial. It had gold and silver in mind as the ultimate goal, but, with a prudence characteristic of British enterprise, it had also an eye to nearer and smaller profits. The plan of colonial manufacture was meant to serve this end. On the second voyage of Captain Newport eight Poles and Germans were sent over for the express purpose of making glass, pitch, tar and soap ashes. The glass house was out in the woods, about a mile from Jamestown. It was a crude affair, but it seems to have been the center of considerable activity, for when the ship returned to England in the following year "a trial of glass" was among her cargo. The glass was presumably exported in the form of common black bottles, for the state of the art in those days and the limited time would scarcely have allowed the evolution of anything more difficult of manufacture. The progress of the glass industry in America has been far from constant. It has suffered severe and violent fluctuations amounting almost to annihilation. Several times it has needed to be born again. But the sum total of these successes and vicissitudes has been the establishment of an industry which, while it is the oldest, is also at the present time one of the most promising and most highly developed of all our industries.

Salt Water Street-Sprinkler.

The practice has become quite prevalent at English seaports to use salt water for street-sprinkling, and the method and result are pronounced very satisfactory. At Yarmouth, which has a population of about 50,000, the salt water is pumped by a gas engine, driving a pump of about 25,000 gallons daily capacity into a tank at a considerable elevation, whence it is delivered through a special system of distributing pipes, nine miles long and three to seven inches diameter; these pipes are of cast iron, coated inside with a preservative compound. The total consumption annually has been 5,000,000 gallons for street-watering, at a cost of five cents per thousand gallons, being a considerable saving over the expense of the same work when fresh water was used; the statement also is made that during the summer months the dust is kept under by the adhesive qualities of salt in the water, and if the surface coating formed by the salt is removed by sweepers at the appearance of the first, no disadvantageous effects can be traced to the use of salt water. At Birkenhead it is found that one spread of salt water on the surface of the street or road proves equal to about three spreads of fresh water, as the latter evaporates under the heat of the sun, whereas the crust on the surface left by salt water keeps down the dust for a considerable length of time. In another locality the report of the engineer claims that one load of salt water goes as far as three of fresh in that place; and in various other towns, where this system has once been put to the test, it has been adopted as one possessing special advantages.

Why Ice Cream is Sometimes Poisonous.

Not long since I was conversing with one of the largest manufacturers of glue and gelatine in the country, when, in illustrating and explaining another matter, he chanced to make an interesting statement in relation to sickness occasioned by eating ice cream, says the *Sanitary News*. I believe that I shall violate no confidence in repeating the substance of what he said, which was, that much, if not most, of the sickness referred to was caused by the use of glue containing some form of antiseptic. The use of gelatine to prevent ice cream from losing form and melting down rapidly is desirable, and even necessary, and were good gelatine, such as is prepared for food purposes, employed, no objection could be raised. But close competition and the greed of gain tempt manufacturers of the cream to buy glue at a less price as a substitute for gelatine. The cream makers are usually ignorant that antiseptics (which are nearly all poisonous) are frequently employed by glue manufacturers to prevent decomposition of the very perishable materials from which the glue is made. The cream maker does not usually state that he wants the glue for making into ice cream, and so the seller has no opportunity to warn or advise, and the cream maker uses the glue and wonders it makes people sick.

Seasoning Oak.

Oak is one of the timbers that requires extra care in seasoning, as its sap ferments and heats more quickly than the sap of any other wood, says the *American Cabinet Maker*. The logs should be sawed as quickly as possible after being cut, or at least after warm weather sets in. It has been noticed that the sap exudes to a considerable extent after the planks are sawed, and that it dries, forming a gummy surface, which, to a considerable extent, prevents the action of the air upon the interior sap.

To overcome this, experiments have been made by putting the planks into swinging crates and sinking them in running water so they are entirely submerged. After they have been in the water two days they are removed and stood upon end under a shed, where they are well protected from the sun and rain, and where there is a good circulation. In this position they dry without warping, and much more quickly than when piled up in the customary manner, and when seasoned the color is uniform.

The Thrifty Japanese.

What is the reason that Japan has no poverty problem? One reason is probably to be found in the land system, which has given to every worker a holding and encouraged him to supply his wants by his own labor. Another reason lies in the national taste for country beauty. Nowhere else are parties formed to visit the blossom trees, and nowhere else are pilgrimages simply for the sake of natural beauty. A country life has, therefore, its own interest, and men do not crowd the cities for the sake of excitement. There is, too, in Japan, a curious absence of ostentatious luxury. The habits of living are in all classes much the same, and the rich do not outshine the poor by carriage, palaces and jewelry, the rich spend their money on curios, which, if costly are limited. Rich and poor are alike courteous. It is not possible to distinguish employer from laborer by their behavior; all are clean, all are easy, all are restrained.—Fortnightly Review.

Electricity.

A New Thermoelectric Phenomenon.

It is stated in many text-books, and pretty generally known, that electric currents may be produced by heating a single metal, if there be any variation in temper, or if the distribution of heat be very irregular and the changes of temperature abrupt, says W. Huey Steele, M. A., in *Science*. These effects are generally supposed to be exceedingly small compared with ordinary thermoelectric effects, but some experiments performed by the writer in the Physical Laboratory of the University of Melbourne show that at high temperatures these effects are sometimes exceedingly large, as great or greater than that given by a junction of antimony and bismuth at the same temperature. At low temperatures this is most apparent in iron wires, iron being the only metal in which I could observe the effect at a temperature below 100°C. If a piece of iron wire be put in circuit with a very sensitive galvanometer and gently heated irregular currents will flow, sometimes one way, sometimes the other, rising and falling in an apparently arbitrary manner. I several times observed the effect simply by warming the wire with my fingers. At a red heat the effect is much more marked and also much more irregular. The effect in iron, however, is not so great as in some other metals at a high temperature, the highest effect I observed in it being .002 volt. Altogether twelve different metals and four alloys were examined and the effect noticed in each of them. In order to raise them to a high temperature without breaking circuit by their fusing I put them through clay tubes (tobacco pipe stems), and when examining metals with low melting points I completely filled up the tube with the metal. A tube of lead when heated gave, after a little irregular heating, .3 volt, and another, with a lead wire passed through it and heated about the middle, gave about half that amount, but in this case there was no irregular or unsymmetrical heating. The effects are not always steady, in fact they very seldom keep steady, but they may be observed with certainty by filling a tube with lead and raising it to a red heat in a Bunsen flame. The effect may also be observed very easily in fine gold wire, but it does not last so long as that in lead, which shows no sign of ceasing after an hour's or half a day's heating. With gold I observed a higher effect than with any other metal, once observing nearly half a volt. Three-tenths volt was observed with six different metals—lead, copper, gold, tin, zinc and antimony—while with others, *e. g.*, silver and aluminum, though I could certainly observe the effect, it was exceedingly small. Sometimes when a metal is heated thus the changes in the electromotive force generated are slow and gradual and at times scarcely perceptible, while at others they are rapid and sometimes apparently instantaneons at a time when the temperature is perfectly steady and nothing is apparent which could cause the changes. Another curious effect is that sometimes when the temperature is falling, after the gas has been turned down or put out, there are rises, generally sudden, in the e. m. f.; this was chiefly noticed in lead. These phenomena are generally quite sufficient to mask the ordinary thermo electric effect at a red heat, and thermoelectric tables are consequently quite unreliable for high temperatures.

Who Invented the Lightning Rod?

An English Assyriologist recently announced that he had unearthed a furnace thousands of years old, in which the hot blast had undoubtedly been used. Just as this archæologist seeks, rightly or wrongly, to deprive Neilson of the credit of his invention, so the German Egyptologist, Herr Heinrich Brugsch, endeavors to prove that

Benjamin Franklin was not the devlser, but merely the rediscoverer of the lightning conductor, as he claims that he has abundant testimony that the ancient Egyptians used a form of this useful instrument for protecting their temples against discharges of atmospheric electricity.

Lighting by Reflected and Direct Rays.

Four inverted arc lamps were tried by John F. Aspinall in one of the Lancashire and Yorkshire Railway workshops at Horwich, says Benjamin A. Dohson, where, however, owing to the great hight at which they had to he fixed, they were not successful. They have since been placed in the large drawing offices, and the light for drawing purposes is as perfect a light as can he. Failing, on acconnt of the height of the workshop, to arrive at a satisfactory result with the solely reflected light, Mr. Aspinall has succeeded in lighting the main machine shop with ordinary open arc lamps, each protruding through a whitewashed disc formed of light boardings framed together. A curious combination is thereby produced of lighting by the reflected and direct rays. It is not the whole of the advantages of the reflected light, because the eye has a tendency to glance upward toward the dazzling arcs, and shadows are projected. Nevertheless, the writer is convinced that by this combination of reflection a gain has been achieved of at least 25 per cent over the ordinary direct arc lighting without reflection; and all concerned are satisfied with the result.

The Purity of Gold.

The purity of gold is estimated by an Abyssinian weight called a carat,· Arabian quirrat, a bean, the fruit of the carah tree, which is subdivided into four parts called grains, says an exchange. The term carat when applied to gold and silver is not a weight unit, but the mode of expressing the purity and fineness of the metal in twenty-fourths. Thus 18-carat gold is metal in which eighteen parts out of twenty-four (or three-fourths) are pure gold. This method of estimating fineness is traceable from the marc of Europe having been divided into twenty-four-real carats or actual weight units. The present method is to estimate fineness in thousands; *i. e.*, gold fine has 250 parts alloy, corresponds to 18-carat gold, three-quarters of the metal being pure gold in each case. Our gold coins are 21.19.

A Caution.

One should always have close beside the bed at night a candle and a box of matches. If there is occasion to take in the night a dose of medicine—nervine, an oplate or a tonic—never take it in the dark. One may be perfectly certain mentally of the place where the bottle or the box was located when his attention was last called upon the thing, but in the meantime a maid intent upon clearing up or the mistress herself may have made a change. It is not safe to snatch at freedom from pain in the dark, and cases not a few are on record where people have made irremediable blunders, finding out too late that what they supposed an innocent remedy was a deadly poison.

A Novel Pencil.

A novel lead pencil has been invented by an Eastern man. · The pencil is covered with narrow strips of specially prepared paper, run on coils, and so arranged that by releasing one end of a coil with a pin or the point of a penknife a strip of paper can be reeled off, leaving the pencil with a cone point and about one-eighth of an inch of an inch of lead uncovered. The company proposes to cover lead, crayon and slate pencils in the same way. The pencils are painted in fancy colors, and so closely wrapped around that the seams in the paper are said to be invisible.

$1000 WORTH OF LAW
FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 500 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores:
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientis nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

PRACTICAL TREATISE ON HYDRAULIC MINING.
By AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdye, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

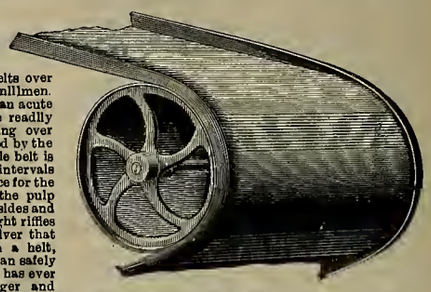
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager. 419 California St., San Francisco.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorbies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Coast Industrial Notes.

—N. D. Rideout announces the sale of his interest in the California State Bank of Sacramento to a local syndicate.

—An enthusiastic mass meeting was held at the Opera House at San Diego recently to devise plans for helping along the construction of the first ten miles of the San Diego and Phœnix Railroad.

—The Northern Pacific terminal shop employes and car-builders have decided to accede to the 5 and 10 per cent reduction in wages, their organization not being thorough enough to resist at present.

—San Bernardino citizens are signing a petition urging the Board of Supervisors to submit to the voters of the county a proposition to issue bonds in the sum of $250,000 for the purpose of improving public highways.

—Articles of incorporation of the Payette Valley and Northern Railroad Company have been filed at Boise City, Idaho. The company proposes to run the road from some point near Payette to Moscow or Lewiston, and other branches are also being provided for.

—The California representatives in Congress have received letters from the Pacific Pine Lumber Company of San Francisco requesting them to use their influence to prevent the placing of logs on the free list as raw material. The petitioners claim that logs are not raw material.

—At a special meeting of the Justice Mining Company last week, R. P. Keating was elected superintendent, vice Charles Lyons. The company is to go ahead and open up the mine, and a test run of ore of about 200 tons is to be made, after which the company will either lease or buy a mill and do its own crushing.

—A pipe-line scheme to supply Sonoma county towns with water is projected. The undertaking contemplates the construction of a water system having its source near Ukiah, Mendocino county, and which will extend from that point to Cloverdale, thence to Healdsburg, thence to Santa Rosa, thence to Petaluma, and from thence on to San Rafael.

—The Davis sawmill, at Pine Ridge, Fresno county, has been burned. The mill, valued at $20,000, and more than $25,000 worth of lumber, were destroyed. There were also several spans of the Pine Ridge flume burned, besides a few private bunches of lumber which had been sold and not removed. The total loss is about $50,000, with only $10,000 insurance.

—The Idaho State officials have been made cognizant of preparations on the part of a Michigan syndicate to secure a large tract of timber land recently surveyed in Shoshone county. The survey includes 80,000 acres of the finest timber land in the United States, and was made at the instance of the State authorities. The plan is to secure men to settle on the lands as bona fide settlers and afterward sell out to the syndicate, by which scheme they hope to secure valuable timber for their private gain.

—The Pioe Ridge flume, in Fresno county, has been completed. It is 52 miles in length, extending from Stevenson creek, at an elevation of 500 feet, to Covis, on the Pollack Railway, 12 miles from Fresno, at an elevation of 400 feet. The flume in its construction surmounts many engineering difficulties, and for 12 miles is double, carrying 300 cubic feet of water per second for irrigation. This will bring 40,000 acres of new land under water. Many million feet of lumber will come down the flume annually.

—The pioneer ship of a Japanese coal fleet has arrived at this port from Kuchinotzu. She is the British ship Aigburth, and made the passage in the smart time of 33 days. Other vessels, coal-laden and consigned to E. C. Evans, agent for the Japan mines, and on the way, are the American schooner Puritan, the American bark Mt. Washington and the British ships Bandaneira and Lord Downshire. Some of the coal is in pressed bricks, but the most of it is destined to enter into competition with the cheaper grades of coal prevailing here.

—The Bear Valley Company, which has a capital stock of $4,000,000, and has heretofore paid 15 per cent annual dividends, and which supplies Highland, North San Bernardino, Redlands, Alessandro, Moreno and Perris with water for irrigation purposes, has, during the recent money stringency, been attached in sums of thousands of dollars due for work and material furnished in extending irrigation canals and pipe lines to new districts during the past summer. F. P. Morrison of Redlands has been appointed Receiver by order of the Superior Court.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

THE BULLION.—Forbestown *New Era*: The Bullion Mining Company is making rapid progress on their mill. They now have about a dozen men at work hewing and getting out timbers. They expect to have their mill completed and running about the middle of January. Mr. Kimball is engaged with a crew of 20 men running a branch ditch from the main ditch to supply this mine and the Denver with mill power.

Calaveras.

LEDGE DISCOVERED.—Murphys Cor. *Citizen*: Some little excitement exists on the grade below Murphys, owing to the fact that a quartz ledge has been found in close proximity to the road. The discoverers or relocators are J. A. Black and Mr. Stimezer, both of whom have prospected in this section for some time past. The lode they are opening up is about four feet in width, and is of a very pretty character, being completely filled with very pretty sulphurets, and being of the ideal "blue ribbon" quartz. An assay of the sulphurets has been made by Assayer Smythe of the Utica works at Angels, and the result was sufficient to greatly encourage the owners to push work as fast as possible. Both gentlemen have but small means, but have shown a willingness to develop the mine as rapidly as they can under the circumstances.

SHUT DOWN.—West Point Cor. *Citizen*: The Hard Lead Mining Company have shut down their property for a couple of weeks. The Hard Lead has been quite famous of late. Since the present company took charge of this mine it has yielded fine ore, some paying high.

THE CENTRAL HILL MINES.—*Chronicle*: The gravel mine owned by the Gold Bros., which has recently been opened by a Sacramento company, is looking fine. A tunnel 260 feet in length has been run into the channel, and the gravel prospected shows a paying mine. The improvements already on the mine consist of a blower to take the powder smoke out of the tunnel and a trestle 100 feet long to dump the gravel into the mill, which will soon be erected. F. Gold of this place has been engaged to put up the mill and a number of other buildings.

The Merrimac, Monitor and several other mines in this vicinity will soon be in operation.

Los Angeles.

NUGGETS FOUND.—A dispatch from Pasadena says: A couple of miners down from the mountains were in town exhibiting gold nuggets which fairly bristled with the precious ore. Between them they had fully $100 worth of gold in nuggets and dust, which they claim to have worked out of a mine recently located by them in the mountains north of this place. Just where the mine is they refuse to state, but claim there is plenty of gold in sight. They came down on account of the snowstorm, but will secure provisions and return at once. Whether there is anything in the story or not is hard to tell, but rumors of big finds in the mountains have been floating around for some time, and it is possible that the men have made a big hit, as they claim. Old miners have long claimed that there is gold, and plenty of it, in this range of mountains, the mineralogical conditions being such as to furnish this idea, and that it will be only a question of time until some one strikes the lucky vein. The mine which was recently discovered near the Lowe Mountain Railway by Mr. Dickey, which promises to produce some excellent paying ore in large quantities, lends color to these predictions. The discovery of some well-paying gold fields in the vicinity at present would prove very acceptable and be of great benefit in the development of southern California.

Modoc.

QUARTZ VEIN UNCOVERED.—It is reported that a rich quartz vein was discovered by a prospector named Layton, near Willow ranch, in Goose Lake valley, last Thursday, says the Alturas, Modoc county, *Herald* of November 27th. The new discovery adjoins the Candlestick mine, owned by J. A. Barnes. Free gold can be seen with the naked eye all through the quartz.

Nevada.

STRUCK RICH GRAVEL.—*Transcript*: Richard Ellison and Henry Tremaine, who have been running a tunnel on Selby Hill for a long time, struck rich gravel the other day. The indications are that they have tapped the main channel which runs up the ridge from the old Nebraska, and which was immensely rich when that company worked it many years ago.

AT THE EAGLE BIRD.—*Transcript*, Dec. 7: The new owners of the Eagle Bird mine at Maybert have started work. After getting the water all out, men will be put to work sinking the shaft 300 feet deeper. Everything about the hoisting works and mill is being put in good shape, and the company are doing things in a systematic manner.

AT ROUGH AND READY.—The future of Rough and Ready promises to rival the activity of the early days when mining had a most successful boom. From J. F. Schroeder of that burg the *Union* learns that the Osceola mine, owned principally by Messrs. Schroeder and Hunt ress, and the Central Pacific claim, owned by John Fippin, were bonded yesterday to Oakland men of means who will at once commence active work on quite a big scale. Six mines—the Prince, owned by Dunstan Bros. of Grass Valley, Mistletoe, Moss Ledge, Central Pacific, Osceola and Grant—have been working on a moderate scale, employing a few men for some time, but many more men will be given employment in the near future in several of them. The ore in the Rough and Ready district is not free-milling, but must be treated by the smelting process to yield much of a profit. Experiments by this method quite recently prove this statement, which fact, being known, will probably result in the opening up of a number of new claims.

Placer.

IN GOOD SHAPE.—Placer *Herald*: The drift mines east of Rocklin are showing up in good shape. Since the irrigation season closed and water has been available for power, the Harlow mine has started up again under the direction of Dr. Barton, and our information is that it is paying big. At present it is working some eight or ten men. The Leahy mine, near the Harlow, is also at work and reported as doing well for its enterprising owners.

SURVEYING RESUMED.—Colfax *Sentinel*, Dec. 8: E. C. Uren and a crew of six men again resumed surveying for the line of the South Yuba ditch on Tuesday morning. They commenced near Hayford's crossing, and at present are below New England Mills. They will survey as far down as Clipper Gap. A crew of seven men were put to work Monday morning, digging the ditch near Cape Horn Mills. Before long a much larger gang will be put on, and the ditch pushed to completion as rapidly as possible.

Plumas.

AT THISTLE SHAFT.—*National-Bulletin*, Dec. 7: On Tust, August Holtz, foreman of the Thistle Shaft drift mine near Gibsonville, arrived in Quincy. At the present time about 50 men are employed. This is owing to the small supply water at this season of the year. When there is a plentiful supply of water to wash all the gravel extracted from the big channel, the company employs from 80 to 100 men.

PROSPECTING AT SPANISH PEAK.—*National-Bulletin*, Dec. 7: Geo. Morton, W. H. Bradford and others have located a large tract of mining ground at Spanish Peak, covering the old Monte Christo claims. It is their intention to prospect them next spring. During the past season Mr. Morton did sufficient prospect work there to convince him that there is a big gravel mine in the mountain, and he and his associates propose to make an effort to find it.

Riverside.

A THRIFTY CAMP.—Governor Blasdell is building up quite a little settlement around the Santa Rosa mine, near Perris, and it gives promise of becoming a good-sized, thrifty camp, says the *New Era*. The mill is working night and day, and a large amount of ore is being crushed. Ore is being taken out of the north drift in the mine and it mills well.

San Diego.

GOOD RESULTS.—The Nuevo *Sentinel* states that the Ready Relief, probably the best mining property in San Diego county, has been yielding splendid results for the owners, and at the present time a large quantity of high-grade ore is in sight. The Ella mine requires no comment. It will be remembered that in May $7000 in gold was taken out, the result of two months' work by three men. There is to-day on the dump a pile of ore estimated to contain from $10,000 to $12,000 in gold, all taken out of the mine in the past three months.

Sierra.

EIGHTY TONS OF MACHINARY.—*Mountain Messenger*, Dec. 8: The largest mining enterprise ever inaugurated in Sierra county is now under good headway. During two weeks past upwards of 80 tons of mining machinery has arrived in this city for the mine, which is known as the Mt. Moriah, and is situated on the old emigrant road above Alleghany and Forest City, about 30 miles from Nevada City. Upwards of 45 tons of the machinery has been forwarded to its destination by team, and there are about 35 tons at the depot now awaiting shipment. A portion of it was loaded on two freight wagons last evening and started for the mine to-day. On Saturday a dispatch came from the mine requesting two barrels of lime and some cement to be shipped through by private conveyance with all possible haste to Freeman's Crossing, where a fresh team would be ready to take the freight to the mine. Con. Grissell secured a thoroughbrace wagon, and with four of his best horses hitched to it, started off with the freight yesterday morning and expected to make the trip by 10 o'clock last night. It has been impossible to secure freight teams here, else all the machinery would have been on the ground before this time. This new enterprise is controlled principally by Eastern capitalists, and the way they are rushing the work of erecting hoisting works, mill, etc., is just paralyzing to mining men. The mine is a good one and the company propose to get some of the bullion out of it as soon as possible. Other quartz properties in that section are to be opened up.

STARTED THEIR MILL.—The *Mountain Messenger* learns that the Bonanza Gold Mines (limited), near Sierra City, have started their mine and have most excellent prospects. A fine prospect has been obtained in all parts of the mine and the ore worked is now paying $8 per ton.

Siskiyou.

AN EXTRA FORCE. — The Greenhorn Blue Gravel Company, says the Yreka *Journal*, has put on an extra force since the commencement of the rain-storms and expect to realize a greatly increased gold yield. Prior to the storm $500 a week was the average, with only two pickmen at work in the pay drift, with others prospecting in new drifts from the main tunnel.

FOR THE FAIR.—Yreka *Journal*, Dec. 13: Large quantities of fine-looking specimens of quartz have been received in Yreka lately as specimens for exhibition at the San Francisco Midwinter Fair. Every section of the county will be represented, as specimens are received almost every day. The Schroeder mine on Deadwood mountain sent several specimens to Manrioe Renner last week, one block weighing about a hundred pounds, showing gold in great quantities to the naked eye. Specimens have also been received from Humbug creek, Klamath river and Scott valley, all of which yield rich pay in milling.

Last week we were shown a handsome nugget of gold and quartz worth about $20, which H. W. Howland picked up while working in his claim on Spring gulch, Yreka Flats. Yreka Flats in the '50 period was exceedingly rich, and whenever new ground is touched, good pay is certain—in fact much of the ground has been worked two or three times with profit, and is likely to be worked again as soon as plenty of water is obtainable without too much cost.

David Henry, an old-time miner of this place, writes us from Trinidad, Colo., about his belief that good diggings exist on the South Umpqua river in southern Oregon. He says he went from Wallamette valley to Yreka in the fall of 1854, driving a herd of beef cattle belonging to Henry Owens. Crossing the South Umpqua on the old wagon-road, there is a fall of about four feet, making a kind of rapids. About 20 steps below these rapids, he saw considerable gold on the bedrock. As the waves receded, they carried the light sand away, leaving the bedrock exposed. He picked up two pieces of smooth gold, one weighing two grains, and he firmly believes there must be good diggings farther up that stream. Mr. Henry was a miner for one year on Greenhorn and for seven years on Humbug.

E. F. Staples, the manager of the quartz mill and mine at Hungry creek, Siskiyou mountain, has about 14 men at work at present, and runs a night shift. He expects to get out a great quantity of quartz during the present winter, so as to keep the mill going steadily during next spring and summer, and also during the winter unless heavy snowstorms prevent.

Sonoma.

TO DEVELOP PAINT MINES.—Articles of incorporation have been filed at the County Clerk's office of the Indian Metallic Paint Company. The incorporation papers recite that the purposes of the company are to locate, mine, sell and manufacture into paint metallic ores in Sonoma and other counties of the State. The capital stock is stated at $100,000 and there are 100,000 shares of stock. The directors of the company are John Bliss, M. D. Merritt, Jacob Palmer, Vernon Wilson and John Wilson, all of Oakland, and that city is named as the principal place of business. In a number of places in Sonoma county, notably at Occidental and Pine Flat, ochre has been found in large quantities, and preparations have been made to mine it on an extensive scale and manufacture it into paint. Near Occidental there are hundreds of acres containing ochre-bearing veins.

Tuolumne.

THE ARBONA.—*Independent*, Dec. 8: The Arbona mine, near Tuttletown, is having a trial crushing at the Joe Hampton mill, and judging from the plates, the rock will prove payable—from $5 to $6 per ton will probably be the result, although we should be pleased to hear that it will go over our estimate.

The Rawhide still continues to take out the same class of rich ore, but what is most satisfactory, the rich shoot has been tapped at the 500 foot level.

The Alameda is north of the Rawhide 3000 feet. It was purchased this week for $18,000, $1000 being paid in cash, the balance in one year—a very low figure considering its well-known value. W. A. Nevills was the purchaser for a San Francisco company.

The Crystaline mine is crushing and taking out good rock—getting richer as developments proceed. The late rains gave them more water at the mill. This property is developing into a very valuable mine. Tellurium is now seen in the rock.

In the App mine rich rock is being daily extracted from levels 700 and 800. Everything is running smoothly and prosperously, and the future of this valuable mine is assured. Several others at or around Quartz Mountain will be started up shortly, while a decided boom has set in, in that locality, the App having given a general impetus to mines on the mother lode at this point owing to the late rich discovery.

At Belle View prospecting still continues in the above mine. The work to the north at the 300-foot level, has been abandoned for the present, while the work now in progress is to the southeast at this depth. The contract for the 100-foot level is nearly completed, but as the vein looks well the superintendent has written to the company in San Francisco, to drive another 100 feet. He thinks that within this distance good, payable quartz will be found.

At Black Oak the mine is looking bright and prosperous. The shaft is at present 650 feet in depth, and when 30 feet farther is gained a level will be run to the north. The vein at the bottom of this shaft is six feet in width, and is heavily charged with gold, galena and sulphurets. The great abundance of galena makes it necessary to save the largest pieces for a separate process. The mill is not running owing to improvements. New plates and blankets will arrive from the East in a few days, together with new steel shoes and dies, and when these are put in work will be resumed.

The Lanra is down about 300 feet, and when 400 feet is reached, a level will be run to the north, for the Little Carlotta, which is about 100 feet distant, and the North Star 600 feet from the Laura. As neither wall is in sight, the width of the vein is not known. Three shifts are employed, working day and night.

Eureka consolidated resumed work last Tuesday. The late rains increased the water supply

so that everything is running again in full blast.

The Seminole, near Sumnereville, has commenced crushing on a good batch of rock, and will receive good and faithful attention from O. Mason, at whose mill the rock is being worked.

Mr. A. Patterson and son lsft Sonora this week for the Ham & Birmey mine, on which property they will construct a ten-stamp mill, which speaks well for the future prosperity of that mine.

The Santa Maria mine is located on the Yosemite road, and near Crocker's station. Area 1500x600 feet. One hundred and fifty thousand dollars has been extracted, on or near the surface. The deepest sinking on the whole mine does not exceed 100 feet deep, besides three tunnels and a numher of open prospecting cuts. No. 1 tunnel is situated on the east eide of the mountain, which is a partial crosscut and is entered 150 feet. The vein was tapped at 50 feet from the entrance. The rock paid all through $30 per ton; frrther a winze was sunk from the floor of this tunnel, 50 feet on vein, which paid $50 per ton, free gold, the sulphurets have a value of $1800 per ton. No. 1 tunnel on west side was drifted on vein 200 or more feet. Rock paid from $40 to $200 per ton in free gold. Thie was known as the old Gilson tunnel. The vein was stoped to surface, hacks of about 40 feet was worked. No. 2 tunnel on west side is known as the low level and ie entered about 150 feet, where the vein was interaected. The vein at this point is from 20 inches to two feet, with very heavy eulphuretted ore, of from eight to ten per cent of very high grade. There is an abundance of water for steam purposes, likewiee timber and firewood for all time. There is a Huntington mill on the mine with a 10-horse power engine and boiler which has a capacity of 10 tons per day. The mine is in a good condition for immediate work, and rich rock can he taken out right away, without any outlay for repaire of any kind. The mine is owned by Messrs. Neale and Crocker.

NEVADA.

Washoe District.

THE NORTH BONANZA.—Virginia *Chronicle*, Dec. 7: Superintendent Dave Crosby of the North Bonanza mine yesterday started the mine up for a trial run. Mr. J. W. Pearson, the well-known mining man, who was in Virginia for several days recently, was here for the purpose of getting the affairs of the company in ahape. Men have been put to work in the face of the main tunnel, where the ledge has been opened, and 100 tons of ore are to he mined for immediate milling. The ore ie to be milled by Colonel Boyle at the Dazet mill in Silver City, and, if the returns juetify it, the mine will be opened up on an extensive scale and regularly operated. The mine ie located at the mouth of Six-mile canyon, and the ore will he hauled to the mill at Silver by Tom Barton's teams. The hauling and milling can be done for $6.50 per ton.

Superintendent Crosby states that, if the returns from the ore milled are favorable, the company will probahly engage Fisher's mill, which is near the mine, to do the crushing. He has confidence that the mine can be worked at a profit, and expects that it will soon form one of the regular industries of this region.

A SHAFT BREAKS.—*Chronicle*, Dec. 11: Operations were suspended at the Con. Virginia last night by the breaking of the iron shaft in the flywheel on the engine. The hreak was diecovered by the engineer at about 7 o'clock, and operations were brought to a halt and the afternoon shift of miners, who were at work, removed from the mine. The break was close to the flywheel, between it and the pinion or small cogwheel, and across the shaft. The shaft did not break in two, but it was rendered useless and unsafe hy a big crack in it. To-day workmen were at work taking the broken shaft out of the wheel, and another shaft was being prepared at the McCone foundry. The new shaft will probably be in place by to-morrow or the day after. Opsrations will, no donht, be resumed by Thnrsday at the latest, and things be going along the same as ever. The accident will set the West Con. repaire and the excavation of the Rule drift back a little, but not enough to speak of.

SUMMARY OF COMSTOCK OPERATIONS.—In the Consolidated California and Virginia mine the sonthweet drift (the Rule drift) from the 1000-foot station of the Con. Virginia shaft has been advanced during the week 60 feet; total length, 90 feet; face in soft porphyry and clay. On the 1650 level in the vicinity of the winze, at a point 20 feet down, there have heen extracted during the week 91 carloads of ore—ahout 20 tons—the average assay value of which is $31.60 per ton. In the Ophir mine, on the 1465 level, the west crosecut from the main north drift has been extended to a total length of 246 feet, and the face is in porphyry and clay. On the 1465 level of the Mexican mine the eouth drift from the top of the upraise, 45 feet above the eill floor, is in 51 feet, and the face is in porphyry, clay and quartz of low valus. On the 900 level of the Union shaft the joint north drift running from the joint west drift at a point 1520 feet west from the shaft has heen extended during the week 18 feet; total length, 277 feet; face in porphyry and small streaks of clay and quartz. In the Andee mine the west crosecut on the 420 level has heen stopped. No changes are reported in the eaet crosscut.

In the Beet & Belcher mine the east crosscut on the Con. California and Virginia line on the 900 level ie out 136 feet. The face is in porphyry. In the Hale & Norcross mine on the 1300 level they continue stoping out ore from the winze below this level, and extracted during the week 33 cars of ore, assaying $34.87 per ton per car sample, and 19 cars of ore, average assay per car eample $18.57 per ton. In the Yellow Jacket mine during the week they extracted ahont 100 tons of ore from the raise above the 1100 level. The average aesay valne of car samples was $37 per ton. In the Kentuck Con. mine on the 1100 level the west crosscut from the south lateral drift has heen extended eight feet and then stopped. The crosscut passed through five feet of fair grade ore and they have started to drift south in the ore. They have also atarted an upraise from the north crosscut in ore of fair quality. In the Occidental Con. mine from the west ledge above the 400 level they continue to extract ahout 10 tons of ore per week of the average assay value of $48 per ton. The west crosscut, started at a point 75 feet helow the 300 level, is now in 160 feet and continues in porphyry with seams of quartz. They milled during the month of November 92 tons of ore and slums, and produced bullion valued at $1498.

TO RESUME WORK IN ALTA.—*Territorial Enterprise*, Dec. 10: Superintendent Boyle is authority for the statement that operations will he reeumed in the Alta mine next month, unless the directors of the company should change their present intentions, which is not at all likely. Colonel Boyle says there is a large body of lowgrade ore on the upper levels of the mine that will pay operating expenses, and that exploratory work may lead to the discovery of higher grade. The ore referred to is on and above the 930 level and that is the point where work will begin. The Sutro tunnel connects with the Alta workings at a depth of 1050 feet helow the eurface, but the water level of the mine is in the vicinity of the 1300 level. The Alta mill is in good repair as well as the hoist plant, and all that is necessary to resume work is to put fires under the boilers. The mill is equipped with 15 stamps and concentrators, adding materially to the perceutage of bullion returns from the ore, some of which carries a small percentage of hase metal.

Devil's Gate District.

PRODUCING PAY ORE.—*Territorial Enterprise*, Dec. 8: The Haywood mine is steadily producing fair-grade ore, of which there is apparently an inexhaustible quantity in the mine. The Haywood is considered one of the best properties in Devil'e Gate district and has produced a quarter of a million in bullion. Col. Qninn is the principal owner.

W. Naleigh, the veteran prospector, and H. Smith are getting some ore out of a location near the Occidental.

The Oest mine is sending ore to Taylor's mill, and the owners will probahly make a $10,000 clean-up for Novemher.

The ore cut in the Zadig tunnel will probahly be sent to the Rock Point mill. When the tunnel is completed it will prove as important for draining the mines of Devil'a Gate district as the Sutro tunnel is to the Comstock. The Zadig tunnel, when completed, will admit of the mines connected with it heiug drained to a depth of 200 feet below the present workings.

There is but little work in progress at the Red Jacket. There is said to be pay ore in the mine if it is economically conducted.

Prospectors are at work on various other locations industriously seeking for ore and frequently find pockets the proceeds of which pay them handsomely for their labor.

Palmyra District.

AN ALUM MINE.—An alum mine has been discovered in Palmyra and Indian Springs district, Lyon county. The *Times* says samples which have heen analyzed contain 72 per cent of alum of the following composition: Alnmina, 22.19; soda, 17.30; sulphur acid, 13.38; water, 30. The claim has not been prospected to any great extent, but the indications are that there is a hig deposit of the material. It lies within six miles of the C. & C. railroad and can be put on the market at reasonable rates. It has heen decided to ohtain a quantity of the alum for an exhibit at the Midwinter Fair in San Francisco.

White Cloud District.

THE COPPER MINES.—Supt. Geo. L. Fitzgerald is giving the ores of the company's claims in White Clond district, Humholdt county, a thorough test, says the *Era*. He expects to he occupied in the laboratory for the greater part of two weeke more, hy which time he will have formed a good idea of the general richness of the lode and smelting properties of the different ores of copper in the canyon.

No. 1 tunnel has cut into the Red Oxide vein, which has an immense outcrop of iron containing copper. The men have encountered a cave, and among the eoft formation, which is falling, rich copper ore is fonnd. The progrees of thie tunnel is watched with anxiety, for the workmen may at any moment get into an extensive body of peacock ore. Eminent mineralogiets, who have examined the lode, have etated that as depth ie attained large bodies of copper will be encountered, and, if snch proves correct, the strength and width of the veins justify the aesertion that the company own as extensive and valuable a copper property as ie known to-day.

C. A. Hitchcock, who made a conditional sale of the mines to the New York Company, is a man of much mining experience. Before taking the property in hand he went carefully over the ground, taking eamples from here, there and everywhere along the lode, and a general average of the same tested had made him an enthueiast and inspired him with the opinion that not only would the iron give place to the copper as depth was reached, but that even the croppings, hy an economical process, could he reduced at a profit; and apropos it may be of intereet to state that five and six per cent copper is mined at a profit in Arizona and Montana.

Captain E. B. Wilder of Salt Lake City, who has had a mining experience which in terms of years there are none to compare in this conntry, pronouncee the property a most valuable lode, and asserte that by proper mining large ore bodies should be uncovered with but small outlay. Captain Wilder had charge of a somewhat similar group of mines in Cuba 30 years ago, which netted the owners fortunes.

ARIZONA.

PLACER DISCOVERY.—*Enterprise*, Dec. 7: Another placer discovery has heen made in southern Arizona which will do much to place it in the foremost line of gold-producing sections before very long. Thie time some Mexican prospectors discovered in Yuma county, near the Pima county and Sonora lines some gold fields which are reported quite rich. The placers are reported to he miles in length and width. A prospector named Grijalvas discovered a ledge in the same vicinity which is 2 to 3½ feet wide, composed of honeycomh quartz or spar, which shows free gold in large quantitiee. Specimens have been received at this office which leave no douht that there is plenty of yellow metal where they come from. The Mexicans who are at work on the placers have brought in considerable of the gold and have disposed of it to banks and stores.

SHUT DOWN.—*Herald*: The Harqua Hala mine and mill have closed for ahout two months, or until the new shaft is completed so the ore that is extracted in the mine can be taken out of the new shaft, the mine being in a dangerous condition near the old shaft. It will throw about 100 men out of employment that worked in the mine. The wood-choppere and haulers will continue on with their contract.

LARGE OUTPUT.—*Silver Belt*, Dec. 9: The Old Dominion Copper Company is makiug a large output of copper, and while the production for 1893 will hardly eqnal last year's fignres, owing to the suspension last summer, yet a portion of the loss will be made up. Two 42-inch furnaces have been continuously in blast for several months and are making a splendid record. In one day last week the output was 41,133 pounds copper. The new auxiliary wind-box recently placed on the furnaces has proven of great utility, effecting a considerable ssving of fuel and permitting of the furnaces heing run continuously, whereas formerly two or three hours were lost daily. The weather is favorable to the prosecution of all kinds of surface work and to teaming, and coke is coming in and copper going out with pleasing regularity.

NEW PUMP, ETC.—Mohave *Miner*: A triple-action pump for use in the G. A. R. mine, White Hills, was sent out Thursday morning.

Work is being continued on the Man mine in Todd Bssin. The tunnels now being run in on the ledge will open up a big hody of ore.

John Barry will start up his mill on the Minnesota mine next week. He expects to turn out the richest concentrates ever sent from the county.

A great deal of prospecting is being done in the Aquarie range of mountaius. This range rune north and sonth on the east boundary line of the county.

Work will be started up on a number of claims in Weaver and Minnesota districts as soon as the El Dorado Canyon mill ie ready to receive ores for reduction.

T. L. Ayres has located a fraction of ground hetween the Old Potomac and Eureka, near Cerbat, and ie doing some work on it. The mines in that vicinity carry gold in paying quantities.

A numher of men have quit the White Hills and have gone into the Grand Canyon country in search of gold and copper. They claim to have a pointer on some good gold property in Diamond Creek country.

The Flores mill will he run this winter either by the Flores Company or hy the parties having claims against it. The mines and mill were sold under execution several months ago, and the company will have to get a move on itself if it intends to redeem the property.

The creditors of the Senator mine and mill have agreed to allow the lessees a short time to run the ore now at the mill through, the royalty to he applied on the debts. Messrs. McLeish & McKay came in Sunday night and returned again Tuesday to start up the mill. It is supposed that there is nearly enough ore at the mill to pay un all indebtedness.

The placers near Palomas are panning ont well with dry washere. As eoon ae water ie placed in reach they will turn out boodles of the shining metal.

The ore now heing taken from the lower level of the Nighthawk mine is almost solid ruby silver. The streak is the largeet yet uncovered in past working of that property, and a vaet amount of money will he taken ont in a short time.

MONTANA.

TO START UP.—Butte *Inter-Mountain*, Dec. 9: Rumors have heen afloat to the effect that the St. Lawrence mine would soon etart up, and there is every reason to believe that it will soon be working. The only point of delay is the new railroad, which is not quite ready yet to haul ore. The Anaconda mine has the largest force at work of any of the Anaconda group. The other properties are working about half force. An idea of just how extensively the Anaconda company ie operating may be gleaned from the item of coal. A Union Pacific coal man says the smelters at Anaconda are consuming ten cars of coal and five care of slack daily. When the plant ie in full operation the consumption is 40 cars a day.

The large mining companies are layiog in their winter fuel eupplies, so that snow blockadee will not force them to euspend. The Anaconda company hae about 1000 tons of coal on hand, the Colorado company 600 and the Butte & Boston a like amount.

The local copper emeltere are etill working with vigor. The Heinze plant is turning out now at the rate of ahout 35,000 pounds of pure copper per day.

The American Development and Mining Co. has made important copper discoveries in ita property near Whitehall, known as the Golden Sunlight group. Manager Bacorn says two carloads of ore shipped from there to the Heinze and the Colorado smelters have netted $600 each to the carload. The ore shows 20 per cent copper and 25 ounces silver and about $50 in gold. The company started out with the intention of developing a gold mine, and the recent developments have heen wholly surprising and unexpected. The copper ore was discovered in a winze and has widened from one to four feet. Mr. Bacorn feels highly elated over the prospects. He has found a number of pieces of pure copper in the ore, which he prizee as a curiosity.

The Blue Bird leaching plant, which has heen at work on tailings from the Blue Bird mill all eummer, has been closed down for the season on account of the cold weather. The success of the work has been most gratifying, and when the tailings thaw ont next spring Superintendent Van Zandt will resume the work, which has been under his management.

BRITISH COLUMBIA.

RAILROAD ASSUREN.—The Kaslo people are about to he rewarded for their abiding faith in their terminal advantages for a railroad, says the Spokane *Mining Review*. The Kaslo-Slocan people have at last wakened up, and the contracts are already let for clearing the right of way, the same to be completed before Jan. 1, 1894. Surveying parties have been in the field for several weeks, and Kaelo has assumed an air of renewed activity. It is thought that the Great Northern has been interested in the building of the road. The objective point for this season ie the mouth of Sandon creek, about 28 miles from Kaslo. When it is taken into consideration that this will he the nearest route to a smelting point hy many miles, and will greatly facilitate the handling of Slocan ores, something of the importance of this route may be realized. When this road is completed the ore may he landed at the smelter in Great Falls or Spokane and returns made in less than a week'e time. Until the smelter at Pilot Bay is started, and that cannot be until the Crows Nest Pass cut-off of the Canadian Pacific is completed to furnish fuel, the Great Northern will have the shortest route to smelting points. The Spokane Falls and Northern comes next, and the route around by the Canadian Pacific will require several days longer, and yet from present indications this road will be first in the field.

NEW MEXICO.

PAYING WELL.—Silver City *Enterprise*, Dec. 8: There are 16 men at work on the Lone Mountain Mining Company's property at Lone Mountain. Under the very economical management of Mr. John Brockman this property is paying good profits. The mill is running steadily with good resulte.

Ernest Kitt and Ben Laswell have struck very rich gold ore tn the Mondero mine at Silver Creek in the Mogollons.

Max Schutz has on exhibition a five-ounce gold nugget, panned out in San Domingo gulch last Tuesday. The *Enterprise* has on exhibition a half-ounce nugget, picked up by children at play in the same gulch a few weeks ago.

Pat McDermott is working nine men on the Laura mine at Carlisle. Forty tons of ore were shipped from the mine this week. The ore will run up in the hundreds; it is about equal in gold and silver values.

Mogollon hullion ahipments for the past week include four bars from the Maud S. weighing 422 pounds, and four from the Little Fannie weighing 437 pounds.

John H. Bragaw is showing what practical knowledge and experience, combined with economical management will do with one of our long-neglected gold-mining camps. He keeps the Gaddis mill at Gold Hill running steadily, and besides making a fair profit himself is furnishing many mines and mine-owners in that camp with fair remuneration for their labor, out of the proceeds of ore heretofore allowed to go to waste on the dumps of the many mines and prospect holee at Gold Hill. Last Saturday he ehipped $900 in gold hullion, the proceeds of a few dsys' run. The Baltimore claim, which Mr. Bragaw recently leased to James Wilson, ie producing ore which runs $30 per ton on the plates. Since Mr. Bragaw's advent in the camp, new impetus has been given to every gold mine, and the mines have all paid well thus far for the lahor expended upon them.

IDAHO.

GOOD CLEAN-UP.—Idaho *World*: The Blaine mill finished crnshing six tone of Buffalo ore last Sunday evening. The gold was depoeited in the hank yesterday morning. Its weight was 40 ounces, worth about $14 per ounce. The yield per ton wae $93.33, which ie certainly very high for free-gold ore. The ownere of the mine, Charles and F. H. Cooper, will soon start a tunnel on the ledge, which they will follow for the purpoee of opening up a large amount of etoping ground. The two crushings made from the mine this fall prove that it is one of the most valuable of the gold propertiee of the county.

MONTHLY STATEMENT.—Following is a synopsis of the manager's report to the DeLamar Company for the month of November, 1893:

Tons crnehed	3,413
Value hullion realized	$77,218 00
Value ore shipped	10,000 00
Miecellaneous receipts	1,080 00
Total	$88,298 00
Expensee	38,883 97
Estimated profit	$49,414 03

OREGON.

A MINING SALE.—Baker City *Democrat*, Dec. 7: Negotiations for the purohase of the Badger, Nellie Gray and Grover mines, situated on the west slope of the Elkhorn mountain near Rock creek, which has been pending for some time

past, have terminated in the ownership of the property passing from Messrs. Isador and Herman Fuchs and E. W. Beckworth of this city to Messrs. E. A. Pennington and N. T. McMillan of Fort Worth, Texas. The property is also known as the Beckworth group, given the name of the discoverer, who explored these valuable lodes about four years since. The group has been developed on a small scale for several years, and enough work has been accomplished to show up its true worth. The average assays run $40 in gold. Two four-horse teams, loaded with supplies, have left the city for the mines, and the road between the two points will be kept warm until the winter supplies are in. Fourteen men have been put to work on the property and no time will be lost in placing the mines on the bullion-producing list. The Robinson mill has been leased, and Messrs. Pennington and McMillan expect to commence crushing ore by the first of next week.

RICH STRIKE.—Baker City *Democrat*: On Thursday evening the stage from Elkhorn mountain brought in a large sample of ore from the Baisley-Elkhorn mine, weighing about 300 pounds. This large chunk was taken from the south drift of the mine, where a new and exceedingly rich body of high-grade sulphurets have been exposed, the vein averaging from three to four feet wide. At the present time the mill is not in operation, and development of the mine in the opening up of the new ore bodies will be the principal work at the Baisley-Elkhorn the present winter. The reason of the closing down of the mill was the failure to save the values. The company have under consideration a better process for ore reduction, and will introduce the treatment at an early day.

NOTES.—Jacksonville *Times*, Dec. 8: Messrs. Beck & Black have leased the Sherer & Windom claim in Josephine county and will commence active operations at once.

Wickstrom Bros. & Corliss have purchased the placer mines of Loomis & Hay on Jones creek for $650, and will work the claims to their full capacity this season.

The two mills operating in the Bohemia district have each produced $25,000 worth of gold bullion the past year. The Annie started up again last week. The Bohemia will remain closed until spring.

The mill owned by Dr. Flanagan and Z. Moody, and which has been operated in Williams Creek district for some time past, has been removed to Ashland precinct, where it will crush quartz from the Sherman ledge.

T. J. Chapman, the newly appointed receiver, will soon take charge of the Hammersly mine, in Jump Off Joe precinct. The property is considered to be quite valuable, and a mill has been operated there with considerable success for several months past.

The Bohemia Mining Company has had a prosperous year, and the mine is in good shape for the resumption of work in the spring. The company has made only a 71-days run with a small five-stamp mill, but has averaged over $170 per day. The mine will be extensively developed this winter, as its owners are now convinced of its wealth.

Mining Commissioner C. W. Ayers returned last week from Chicago with three blue ribbons which he carried off for mining exhibits from this State. One is for a placer mine in operation, awarded to Mr. Ayers. The others are one for collective exhibit of gold ores and one for collective exhibit of gold, silver, copper and lead ores, by State of Oregon.

NEW MILLS.—Four new quartz mills are expected to be set up in the vicinity of Ashland this winter.

GOOD CLEAN-UP.—Baker City *Democrat*, Dec. 9: The White Swan continues to keep up its reputation as one of the leading Baker county bullion-producing mines. Yesterday the last ten days' output was brought in and deposited at the Baker City National Bank for shipment. The exact amount of the bullion was not stated, but it is known that it is the largest clean-up had for a long time.

PROSPECTING FOR PLACER GOLD.—Baker City *Democrat*: Col. J. M. Duffy, of Huntington, who is on a visit to the city, informs the *Democrat* that a large amount of prospecting for placer gold is being done on Burnt river, and considerable ground is being located. Some very rich finds are reported, and the locators are losing no time in placing the ground in share for the spring run, and, with a good water season, which is already promised, a large amount of the precious dust will be taken out.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong) this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of infinence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 14, 1893.

The silver market has remained almost uniformly even during the week, both at home and abroad. Prominent silver leaders will meet Friday in Washington for a two days' conference for the purpose of raising money and devising means to secure a silver majority in the next Congress. It is conceded that the anti-silver majority is so large as to preclude the possibility of direct legislation favorable to silver. The attendance promises to include most of the influential silver men from all parts of the country, and the conference will be participated in by many friends of silver in the present Congress. It is expected to raise $100,000 to begin an extensive silver propaganda.

The House Committee on Coinage, Weights and Measures has postponed all consideration of the Bland bill until the second Thursday in January, with Bland's consent, as he found opposition to its being pushed at present.

The Coinage for November.

The several mines of the United States coined during the month of November all the styles of coin known to the American system except two. The aggregate coinage for the month and for the 11 months ending November 30th was as follows:

	For November.	Jan. 1 to Nov. 30.
Double eagles	$2,380,000	$18,318,800
Eagles	5,355,600	19,189 c90
Half eagles	3 054 200	9,700,775
Quarter eagles	.....	75.157
Standard dollars	.....	1,455,565
Half dollars	4,000	1 756,783
Half (Columbian) dollars	.....	2,026,052
Quarter dollars	69,200	2,147,775
Quarter (Columbian) dols	.....	10,006
Dimes	69,140	700,196
Five cents	58,100	604,978
Cents	41,200	418,716
Totals	$11 031,440	$56,403.973
In 1892	2,590,200	44,002,995

All the double eagles coined during November were issued from the San Francisco Branch Mint.

Copper.

The copper market, which a week since reached 10½ cents per lb., has dropped somewhat, but the situation on the whole is stronger. The cause of the advance has been the entrance into the market of large buyers. At the same time a speculative demand arose. The demand for copper to go abroad has been limited, as people on the other side will not pay the higher prices ruling here now. On the other side, however, where consumption continues to exceed all expectations, the statistics for the last fortnight show a decrease of 400 tons in visible supplies, in spite of the heavy shipments from here, which have been said by some home manufacturers to have been made against orders placed by speculators. This, however, does not seem to have been the case, as, if it had, visible supplies would have increased, not decreased.

Lead.

The proposed tariff seems at last to have had its effect on lead, which is down to $3.10 per hundred, after a brief and ineffectual struggle to advance. Since the beginning of the panic of the past summer, prices for pig lead have been from ¾c to 1c per lb. lower than for many years past, and, with the silver and lead markets in their present condition, the only reason for a continuation of such prices lies in the fear of imports of foreign lead being made if the duty is removed.

Silver and the Metals.

NEW YORK, Dec. 14.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.	
Thursday	32¼	69⅝	10 50	3 30	20 50	
Friday	32⅛	69⅝	10 40	3 20	20 45

Mining Share Market.

SAN FRANCISCO, Dec. 14, 1893.

The Comstock market has been very dull during the week, speculation having almost wholly subsided. There are occasionally little spasms of activity and strength which might be compared to the flickerings of the dying embers of a fire. Although business has come to such a standstill, the attendance at the Board-rooms continues large, and the number of customers lounging about the offices of brokers is up to the average of the last two weeks. That more trading was not done by them was probably owing to the fact that they are carrying as many stocks as their means will admit, and are waiting for prices to go up and enable them to make money.

The recent activity in Comstock mining shares brought into Pine street a large number of people who were never "in stocks" before. This class of people has been a great power in sustaining the market, and it is to be hoped that the experience they will have during the next few months will be of great benefit to them.

During the month of November the Eureka and Palisade Railroad Company received in transit to Salt Lake and Vallejo Junction, Cal.: From Eureka Con. mine, 224 tons; Diamond mine, 89 tons; Hamburg mine, 87 tons; Jackson mine, 86 tons; Richmond mine, 68 tons; Phenix mine, 29 tons; Silverado mine, 17 tons; McGarry mine, 15 tons; Idaho mine, 8 tons; Silver Lick mine, 3 tons, and Delaware mine, 1½ tons. Total, Eureka district, 627½ tons.

White Pine district—From Louis Lani, 14 tons; F. Paul, 19 tons; C. A. Mathewson, 71 tons; A. Muir, 53 tons; E. J. McEllin, 51 tons, and G. Siri, 14 tons.

From the Bay State mine, Newark district, 8 tons. Total, White Pine county, 230 tons.

Bullion district, Elko county, "jiggings," 17 tons. H. A. Cohn, Morey, Nye county, 5 tons.

Total shipments during November, 879½ tons.

Board Sales of Mining Stocks.

Cal. Debris Commission Notices.

THE CALIFORNIA DEBRIS COMMISSION having received petitions to mine, by the hydraulic process, from W. R. Stewart, in the Badger mine near Ono, Shasta Co., and to deposit tailings on adjacent flats; from Glonzo Engle, in the Walker mine, near Igo, Shasta Co., to deposit tailings behind dams in Pomeroy Gulch; from McKinstry & Gilbert, in the Christmas Hill Seam diggings, near Butcher Ranch, Placer Co., to deposit tailings on the banks of a fork of the American river; from W. R. Read, in the Tannery Ravine mine, near Challenge Mills, Yuba Co., to deposit tailings behind dams in Tannery Ravine; from Manuel Mateos, in the Mateos mine, near Sierra City, to deposit tailings in Howard creek; from Jos. Davis, in the Davis mine, near Sierra City, to deposit tailings in Howard creek; from Frank Barbero, in the First Chance mine, near Sierra City, to deposit tailings behind dams in Howard creek; from Philip McGuire, in the North Star mine, near Mokelumne Hill, Calaveras Co., to deposit tailings behind dams in Buckeye Gulch, and from J. W. Smith, in the Green Mountain mine, near Mokelumne Hill, to deposit tailings behind dams in Chile Gulch, and from the 54 Flat Placer Mining Co., in the 54 Flat mine, near Volcano, Amador Co., Cal., to deposit tailings behind dams in a dry ravine—gives notice that a meeting will be held at Room 92, Flood Building, San Francisco, on January 2, 1894.

Assessment Notices.

CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

Notice is hereby given that at a meeting of the Directors, held on the 22d of November, 1893, an assessment of $2 per share was levied upon the capital stock of the Corporation, payable at the office of the company, to the Secretary, on the 22d day of December, 1893.

Any stock upon which this assessment shall remain unpaid on the 22d day of December, 1893, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold Monday, the 8th day of January, 1894, at the office of the company, at 1 o'clock P. M. of said date, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

MORGAN BACKUS, Secretary.

THE McGLEW ORE CONCENTRATOR COMPANY.

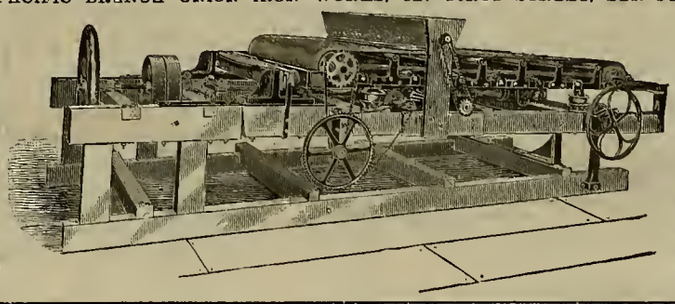
{ PATENTED Sept. 19, 1893. } **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** { FRANK BARRERE, Secretary and Manager. }

CAN BE SEEN IN OPERATION AT THE PACIFIC BRANCH UNION IRON WORKS, 127 FIRST STREET, SAN FRANCISCO.....OFFICE, 116 DAVIS STREET.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, Igo, SHASTA CO., CAL., May 25th, 1893.

THE McGLEW CONCENTRATOR COMPANY: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have some other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

The River Convention.

The River Improvement convention held its fourth annual session at Sacramento last Friday and Saturday, about 60 delegates being present. A memorial to Congress was adopted praying for the adoption of the contract and special commission system for the Sacramento, San Joaquin, bay of San Francisco and navigable waters emptying into the bay; also for the opening of navigation to Redding, and on the San Joaquin to within 30 miles of Fresno, and the further improvement of Oakland harbor. The convention elected delegates to the Trans-Mississippi Congress, called on the river and bay counties to contribute to a fund to send delegates to Washington to remain until the object is accomplished or Congress adjourns, and elected an executive committee of 26, which will meet within ten days to select the Washington delegates. The convention decided not to join hands with the miners in asking Congressional aid for the rivers, though the discussion on that matter was spirited. It is worthy of note that Grove L. Johnson of Sacramento said he looked upon the miners as "natural enemies," a declaration that may be considered somewhat surprising by those who heard Mr. Johnson's very eloquent speech, breathing peace and good will, at the Miners' convention two years ago.

While the miners may not endorse the spirit which dominated the convention, they can rightly be considered as friendly to its purposes. They heartily favor river improvement for the benefit it does the valley interests as well as the indirect benefit it affords them. Their direct interest lies in the construction of works which shall impound the debris and wash from the mountains and allow resumption of hydraulic mining. The convention gave official utterance to no expression which might be construed into opposition to this proposition, and it is to be assumed that the valley interests will not, through the delegation which it is proposed to send to Washington, oppose an appropriation for that purpose. There is no reason why the two interests should be at cross purposes on this matter. On the contrary, it is possible that each may be of help to the other; if not by active measures, at least by a policy of non-interference. That seemed to be the desire of the Sacramento convention, and let us hope its representatives will govern themselves accordingly.

PLATE I. — GREENSTONE VEIN IN THE GOVER MINE.—*See page 404.*

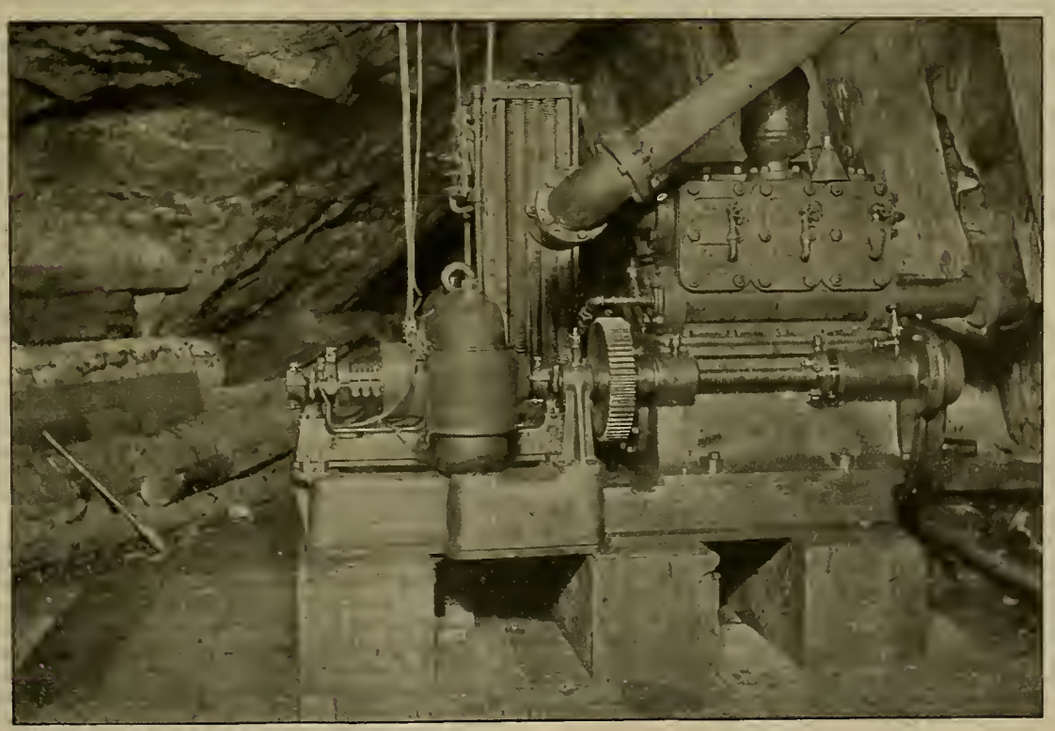

PLATE II. — ELECTRIC UNDERGROUND PUMP AT THE GOVER MINE.—*See page 404.*

SENATOR VOORHEES, late champion of the repeal of the silver purchase clause, has introduced his promised silver bill, and Senator Stewart declares it is a sham and a fraud. It provides for the coinage of the silver seigniorage; for the purchase and coinage of $2,000,000 worth of silver per month after the coinage of the seigniorage; for the retirement of all gold coins of less denomination than $10, and for the appointment of an international monetary conference. While the bill has some good features, it does not meet the views of either the silver advocates or their opponents. It is a good thing to retire small paper currency; and an international monetary conference, though slow, may lead to benefit. The $2,000,000 provision is simply a half-measure.

A NEW million-dollar smelting plant for San Francisco bay is projected by a syndicate of Omaha capitalists, headed by Wm. Lelour. The company is to be known as the Occidental Smelting and Refining Company, and it will handle all kinds of ores. It is said the Great Falls, Montana, plant will be duplicated.

THE Copper Queen Mining Company of Arizona paid a dividend of $50,000 in November, making $300,000 for the year.

MR. W. S. CHAPMAN this week makes a very complete reply to the strictures of "Investor" (D. S. Callahan, 1003 Devisadero Street, San Francisco) on the mines of California, which appeared in a recent issue of this paper. Mr. Chapman has been closely identified with the mining industry of this State and he is as well able as any other man to demonstrate its valne. To the broader statements of Mr. Callahan's letter, declaring in effect that there are no good mining properties left in the State, it seems hardly necessary to make answer; and Mr. Chapman does away with its specific assertions. California is now, as it has always heen, the best, most important and most extensive gold field in the world. Gold mining is here on a basis as fixed and certain as any other industry; and it is to-day more remunerative than any other general pursuit. There are here better opportunities for investment than in any other gold field in the United States and, we think, in the world. If a capitalist cannot with due diligence find a gold mine that gives reasonable promise of proving remunerative, he must pursue curious methods of search and have strange ideas of what a gold mine is.

THERE is excellent reason to believe that Arizona will be admitted to Statehood at the present session of Congress. The lower house has passed an admission bill by a large vote and the Senate will likely take similar action. The chief objection to admission lies in the claim of Eastern Representatives that the balance of power in the United States Senate will more than ever be fixed with the West which is more populous than the East. These opponents of a righteous measure have probably forgotten that that is precisely what was intended to be accomplished when our wise forefathers placed in the Federal Constitution a provision that every State should have two Senators, irrespective of population. To maintain a perpetual union of States they foresaw that each must have an organization as complete and stable as another; and to prevent the strong dominating over the weak, they devised this scheme. Arizona has important mining and agricultural resources, and it has, besides, sufficient patriotism, intelligence, and population, to become a State of the Union. We hope its star will soon be pinned to the flag.

A GREAT DEAL OF ATTENTION has recently been directed to the new placer districts about 30 miles northeast of Mohave, California. Many miners have recently gone in there, and reports are of numerous rich finds. Indeed, considerable sensational matter about the new districts is now being printed in the southern California press. But, allowing for exaggeration, it appears that the new fields have real worth, and are destined to yield considerable gold. The great trouble with the districts is the scarcity of water. Dry washers are used chiefly. A review of the Goler, Red Rock and Summit districts, from a Los Angeles paper, will be found in our Mining Summary. It is given for what it is worth.

The Cruiser Olympia.

The cruiser Olympia, constructed by the Union Iron Works, which on her recent unofficial trip gave indication of being one of the fleetest, if not the fleetest, vessels in the navy, had her official trip last week and maintained an average speed of 22.058 (estimated) knots for four hours. This result is highly satisfactory to her builders, to naval officials and to the public, as it again demonstrates the capabilities of the Union Iron Works for cruiser construction, and adds to the naval force of the nation a commerce destroyer of great speed and power.

The Olympia is a cruiser of the 20-knot class, and she has, by exceeding requirements, earned a bonus of something like $300,000. The builders receive $50,000 for every quarter knot above 20 knots, up to 21.50 knots, and a premium above the latter figure. The Olympia has two triple-expansion engines and twin screws, while the Columbia, her great rival, has three triple-expansion engines and three screws. It is a fact, however, that the Olympia is the more formidable vessel, as the following comparative statement will show:

Batteries.	Columbia.	Olmypia.
Eight-inch rifles	1	4
Six-inch rapid-fire guns	2	.....
Five-inch rapid-fire guns	.....	10
Four-inch rapid-fire guns	8	.....
Total main battery	11	14
Six-pounder rapid-fire guns	12	14
One-pounder rapid-fire guns	4	6
Gatlings	4	4
Total secondary battery	20	24

The Olympia can throw a thousand pounds of shell from her 8-inch guns while the Columbia is throwing 250 pounds from her one weapon of that class, and 600 pounds from the rapid fire guns of her main battery while the Columbia is discharging 464 pounds from hers.

A ship like the Olympia on the Atlantic coast is the New York, which was built by the Cramps, subject to the same speed requirements. The New York made 21 knots on her trial trip and earned $200,000. The New York is 2980 tons more than the Olympia and cost $1,189,000 more. But her achievement, while reflecting credit on the Cramps, cannot justly be regarded as being equal to that of the Olympia.

THE next session of the Trans-Mississippi Congress is to convene in this city February 13th, during the Midwinter Fair. The special importance of this convention to the mining interest will be disclosed when it is remembered that this year's Congress at Ogden passed resolutions strongly favoring the hydraulic mining industry, and asking an appropriation of $450,000 for the purpose of carrying out the Caminetti Act in construction of restraining works. A similar resolution at the coming session will be of substantial value in promoting a bill for an appropriation before the Federal Congress. The Trans-mississippi Congress has in a few years become a most potent organization. It has been instrumental in securing much legislation of benefit to the Western States. The delegates from San Francisco, appointed by Mayor Ellert, are as follows: John Van Bergen, H. L. Dodge, B. F. Dunham, P. G. Sabatie, D. C. Camarinos, C. B. Rode, I. N. Walter, W. J. Sloan, S. H. Seymour, Wendell Easton, Charles Meinecke, I. H. Morse, E. J. Coleman, Oscar Lewis, George B. Sperry, Percy Bsamish, C. A. Laton, W. W. Shannon, Henry Payot, W. W. Sanderson, H. J. Sadler, Eugene Avy, E. Kruse, Henry S. Martin, P. B. Cornwall, E. W. Newhall, S. Nicklesburg, Robert Wieland, Adolph Sutro, J. L. Rathbone, B. P. Flint, Albert Gallatin, Geo. W. Gibbs, L. B. Parrott, John H. Hegler, A. S. Hallidie, M. H. Hecht, Irving M. Scott, Charles Goodhall, Fred W. Eaton, F. J. Symmes, J. K. Firth, W. H. Crocker, J. J. Valentine, J. B. Stetson, John D. Spreckels, C. M. Yates, C. S. Laumeister, A. Sbarboro, Will E. Fisher, C. W. Cross, Arthur Briggs, Rolla V. Watt, John Taylor, I. Truman, S. K. Thornton, Gustav Sutro, Barry Baldwin, W. W. Montague.

WILLIAM B BUCKMINSTER, who is at Washington as the representative of the quicksilver interests of California, has appeared before the committee twice and made arguments to show that unless at least ten cents per pound duty, the existing rate, is imposed on their product, the mines in Napa and Lake counties and elsewhere in California must close down. It ought to be evident to Congress that Mr. Buckminster's representations are well founded. The leading quicksilver mines of California are operating on a very small margin of profit, and they are exceedingly sensitive to tariff legislation. From being a heavy exporter of quicksilver, when a high or low tariff might not make a great difference, the country has in late years been gradnally changing to the position of an importer. At present our mines are just about able to supply home demands. Entrance into this market of the Spanish output will destroy the equilibrium of demand and supply, and be harmful to the industry.

Mr. Chapman Replies to Investor.

TO THE EDITOR:—"Investor" has undertaken to criticise an article written recently by me in regard to the future mining interests of this State. The plain inference to be drawn from his criticism is that the mines of California, if they ever existed at all, are played out or very nearly so; and, as a proof of this, he says "he has run all over the State for the past two years in search of a mine and has not yet found one."

The fact that Investor has been unsnccessful in finding a mine does not by any means prove that mines do not exist in this, the greatest gold-mining country in the world. California, since its discovery, has produced $1,250,000,000 in gold. This constitutes about one-fourth of all the gold in the world; yet this mining was done with crude appliances and by inexperienced men.

It is only within a few years that the science of reducing ores and extracting the gold from the various kinds of ores and the chlorination of snlphurets has been even partially understood, and now experiments are being constantly made looking to the closer and more economical manipulation of the almost limitless varieties of ores—each and all of which require a slightly different process. With our improved facilities and onr better knowledge of mining and of reducing ores, and with the benefit of our now large experience in every phase of mining, we find that mines which 20, and even 10, years ago wonld not pay at all can now be worked very profitably. Mines which have been worked to a limited extent many years ago, and abandoned because they would not pay, are now being taken up and worked with great success and with scarcely a failure. In this connection I will cite the operations of Mr. Hayward, who is doing more mining by far than any other man in California. He has within the last year commenced to open up a number of new (old) mines, every one of which has been *left* years ago by Investor or such inexperienced miners as he or his friend, the "quiet gentleman from the East," who has unfortunately expended $150,000 in testing and looking for a mine, and, like Investor, found nothing that suited him and is "abont to return to his Eastern home in *disgust*."

That quiet gentleman, if he will call upon some good mining man (and they are not scarce), can be shown mines that will pay splendidly, and plenty of them. For the benefit of this quiet but disgusted gentleman, as well as for the disappointed Investor, I will cite a few examples of old deserted mines which have been examined by innumerable experts, so called, and condemned: The Kennedy, which has paid in dividends this year only a little short of half a million dollars; that mine has lain idle, deserted, abandoned for many years, and has been walked over and ridden over many years by mining experts. The great Utica mine, now owned by Mr. Hayward, is paying enormously, the output for last October being $182,000. It was owned by men now in this city. They had a mill on it, I think of 20 stamps, and could not make it pay. They sold the mill, and later sold the mine for $1000, and thought they had done a wise thing. I have not learned whether Investor was their adviser, but snrely he or some expert of equal repute did serve in such capacity.

I will now cite the Rawhide mine as another striking example of this character of mining. That now famous mine was worked many years since by very capable men from some part of Europe, I believe, and a large amonnt of gold extracted. They got down below water level and concluded the ore was rebellious (a word that never should be applied to any ore), built a very large and expensive mill said to have cost $200,000, put in pans to rednce the sulphurets (a dead give-away) and made a disastrous failure, left the mine, and after many years it was bought for $17,000, and is now owned by Mr. Nevills and Messrs. Ballard & Martin, and they have opened the mine down to the 500 level and they find ore that goes from $20 to many thousands per ton. This mine was on the market for years, bonded at various times and examined by numberless experts, such as are very active in hunting mines but never yet have been known to find one.

I might name mines almost without limit which have been carefully examined and sampled by experts who never saw a pick and shovel, much less a drill or a stick of giant powder, and I might say right here that this class of men are an incnbus upon the mining industry and the prosperity of this greatest of all mining States in the world, so far as statistics show.

I cannot refrain from mentioning one more instance to prove that the mines of California are not worked out long since, and that capitalists may look for investments in that line with confidence. I refer to a mine that many years ago was worked upon the surface, and kept more than 100 arrastras in profitable working, but finally they got down to the water level, had no appliances to lift the water from the mine, no power to handle a pump; and the mine was sold in England. The syndicate supplied a large amount of working capital, sent out a *titled dude* as sole manager.

He hnilt roads, dng a ditch and huilt a mill, having hrought from the mother conntry a water-wheel that if half the Sacramento river had been skillfully applied it might have turned the empty wheel around. He did not thlnk in the meantime to develop his mine, hut spent all his money and hecame involved in deht, and retnrned home for more capital hut failed to *dupe his friends* a second time. Finally suit was hrought, judgment obtained, the mine sold under execution, bonght in by the present owner, who has now honded it, and it will prohably fall into competent hands who will no donbt have a repetition of the Utica, Canada, or possibly the Rawhide over again; but should it unfortunately fall into such hands as *Investor*—alas! how unfortunate for the "quiet" seeker after mlnes.

Investor says: "Fearing Mr. Chapman may think I did not properly choose my territory, I will inform him that among the things looked into were two extensions of the 'Taylor.' They were both well opened with ledges from 20 to 100 feet in width, and reputed to run from $4 to $10 per ton, hut after most careful testing they actually went only from 50 to 75 cents." Now the facts are that the extensions of the Taylor mine, hoth north and soutb, are entirely intact, not opened at all in any manner, not 20 feet nor 100 feet wide so far as known, were neither of them either seen or tested hy Investor, hecause not a pound of ore is or ever has heen visihle in either extension hecause not opened in any way whatever. Investor makes a sad deviation from the truth when he says he tested them, for he never saw what is and ever has been invisihle to any and all. True, the Roscrans location does join the Taylor on the south, and has heen prospected to a depth of three or fonr hundred feet, but it is a narrow vein entirely in the green stone and pitches to the west, while the Taylor lies entirely east of the greenstone which constitutes its foot-wall and dips to the east, but really has no connection with the Roscrans. He never prospected either of those extensions, and if these constitute two out of the twenty-four mines he "experted and examined" since January of this year, it is hardly to be wondered at that he "found hut one of them suitable." If this is the kind of examinations he has been making and reporting to his "friend, a quiet gentleman from the East," it is not strange that his friend is going hack "to his Esstern home disgusted."

Investor says he has been "running all over the State for the past two years in search of a mine and has not yet found one." If tbis he true, he should take a rest and not impose his experience npon others who can and do find good mines and who can show his friend, a "quiet gentleman from the East" good, safe mines where he can for much less than $150,000 get such mines as will return him more than that sum net profits every year, and such properties will he shown within one day of San Francisco. Investor says that "for years he has not known of any mine which has been sold through the agency of these parties," that is, the agency he so hitterly denounces. If that he so, these agencies have not injured or swindled any one, not even the "quiet gentleman from the East." If they are doing nothing, why may they not escape the assaults of this marvelous expert, who, like them, has done nothing for two years, though the whole State has heen "rnn over" by him?

I will add that in 1880 Mr. S. K. Thornton visited Nevada City to look at the Providence and some adjacent mines, and while there happened to pass hy the Reward mine which is bonnded on one side by the corporate line of that city. He was favorahly impressed with the location and never lost sight of it, hut in April last formed a syndicate of a few friends, ohtained satisfactory conditions from the owners, and they have expended up to this time $11,300 and are now supplying a mill with ore that pays them $17 per ton, and the mine is now paying more than development expenses. Mr. Thornton is not a Freihurg expert, hut a plain, common-sense hnsiness man.

I hope Investor will in future, when he criticises me, do so over his own signature and not hide behind a fictitious name.

I hand you a slip from the New York *Herald* which shows a different opinion, based, too, upon statistics, from that entertained hy Investor. W. S. CHAPMAN.

CALIFORNIA'S GOLD OUTPUT.

Expert miners and prnspectnrs predict that the new South African gold fields, of which the wnnderful city nf Jnhanneshurg is the commercial center, will, when fully developed, prove to he the richest ever discovered. The character and extent of the depnsits in that territory certainly warrant the expectation that further operations will place it amnng the most famnus mining regions in histnry, its output already exceeding that nf any other district nf similar gengraphical area with the single exception nf California.

It is to California, indeed, that historians must turn for the standard with which to ascertain the comparative richness of all other gnld fields. The record nf that State in the yield of the precious metal stands without parallel in the history of mankind. No nther territnry ever developed gold depnsits so extensive, sn rich nr so enduring, nor has any ever witnessed prnfitahle mlning operations extending over such long periods of time. [illegible]

The gold produced in California since 185n exceeds $1,25n,000,000, and the yield at present amounts to about $13,000,000 a year, or perbaps $7,000,000 mnre than that of any nther State. The output has decreased somewhat in recent years, hut the decline is due nnt tn any general exhaustinn of the territnry, hut to the suspension of the hydraulic mines, which of themselves turned out something like $10,000,000 annually.

These figures set a high mark fnr boomers of the South African gold fields. They represent a contrihution to the wealth nf the wnrld never equalled hy any similar area of territory nn the face of the earth. And Califnrnia, nnlwithstanding the diversion of vast sums of her energy and capital to prnfitable mining operatinns for other minerals, is still turning out mnre than one-third of all the gnld prnduced in the United States.—New York Herald.

Lead and the Tariff.

TO THE MINERS OF THE UNITED STATES:—The new tariff bill imposes a tax of 15 per cent ad valorem on lead dross, and on lead in lead ore, and allows all lead in ore wbich is bigher in silver value tban in lead valne to come in free. Tbe pnvision in eitber clause will paralyze the lead industry in this country.

The former will he 15 per cent on the lead price at Spanish or Mexican ports, wbich price is not ahove the equivalent of 1½c per pound, or say about 1·5c per pound duty. The latter means free lead in vast quantities; or allowing that lead comes in balf and half nn tbe ahove scbednles the duty on the total qnantity will be on the average only 10 cents per 100 pounds. At present tbat would mean refined lead laid down at $2.35 to $2.40 in New York City, which price for lead would net only about 1¼c per ponnd to the Western shipper. Any American mine-owner can calcnlate where he will come out on that. Nor must we he decelved hy the specious plea of those who desire tbis low tariff, and say that the demand from America will advance the European market to a 3½c limit, for the hest authorities state that Spain, Australia and Mexico can turn nut 50,000 tons per annum from their reserves witbout advancing prices more than one-quarter of a cent per pound.

We therefore strennously urge every miner to write to his Congressman and Senator a protest against these lead clauses, and we also urge every mining camp to organize a movement against it and to unite and form a general State committee and to have tbem organize a general central committee. We also nrge all cfficers of lead-mining companies to write and authorize Mr. Hugh N. Camp, of 55 Liberty street, New York, to attach their names to a petition to the Committee of Ways and Means praying them to alter the hill so as to give lead in ores, drosses, etc., a reasonahle protection. The amount of tbe product of their several mines shnuld also be added so as to give weight and value tn the petition. Work in this direction will pay hetter than mining just now.

Foundry Notes.

THE London *Industries and Iron* of November 24th contains an illustration and description of the battleship Oregon, built by the Union Iron Works.

TWO WOODAUBY CONCANTAATOAS have jnst besn shipped to E. G. Stoiber, Silverton, Colorado, making the second consignment for Mr. Stoiber; and three have been seut to Kookomo, Colorado, for the Wilfley mill.

THA Parke & Lacy Company have jnst shippsd a complete five-drill air-compressor ontfit (Iugersoll-Sergeant) to the Harqna Hala miue, Arizona; and a complete two-drill ootfit to Spencer & Sharps, Grub Gnlch, Madera coonty.

DISPATCHES from Washington state that Senator Perkins has resolved that if there is a possibility of getting soch a measure throngh Congress he will have a gon fonndry located at Benicia, Cal. As is well nnderstood in California, it will reqoire something like a $3,000,000 appropriation to pnrchase a site and establish the necessary plant. Perkins, of course, provided he is soccessfol, does not expect at this session to get the reqoired amonnt of the appropriation. Abont all he looks for is an appropriation for the pnrchase of a site and sufficient money to begiu work on the buildings. Even if Congress shonld decide, however, to establish a gun foondry on this coast, California Senators wonld naturally meet with strennons opposition from Senators Mitchell and Dolph of Oregon and Sqoire of Washington. Heretofore the Oregon Senators have endeavored to get Congress to appropriate enongh money to estaonisn a gun fonudry nn the coast, and, naturally, desire it located somewhere in their State. Sqnire has also been an advocate of this matter, bnt he wants it located somewhere on Puget sonnd. In view nf this fact, it wonld appear neccessary for the Pacinc cnast delegation to arrive at some amicable nnderstanding as to the location before snch measore could he passsd by Congress.

Sliokens.

THE Tombstone, Ariz., Mining and Milling Company is pntting in a cyanide plant.

THE outpnt of the Ella miue, between Banner and Julian, is $13,500 for the 60 days in which crushing has been done.

Wells, Fargo & Co. has attached the Clinton Consolidated Gold Mining Company for $5387.51, which represents several claims.

THE Great Western qnicksilver mine of California is credited with paying a dividend of $12,500 in November and $137,500 for the year.

DEADWOOD, S. D., claims the largest matte smelter, largest and most soccessful chlorination works in the world, and a large cyanide plant nearing completion.

PAICAS of wood at Virginia City are now greatly reduced, being as follows: Best nnt pine wood, $10 psr cord; limb wood, $8.25 per cord; split pine and tamarack, $8 per cord.

C. A. CRAWFOAD AND C. P. POST are reported to have sold the Little Annie Gold Mining Company's property at Snmmitville, Colo., to the Consolidated Gold Mining Company for $2,000,000.

THREE Nevada prospectors have nnearthed 500 pounds of amalgam from the lot of Mrs. Newman, Dayton. It is snpposed to have been stolen from the Birdsall mill, 17 years ago, and bnried.

THA Treadwell mine on Dooglas Island, Alaska, has a 240-stamp mill that crushed dnring the last fiscal year 257,255 tons of ore, abont 700 tons daily. This ore yielded $694,659 in bullion, leaving a net profit of $385,614. The average yield per ton was $2.13 in gold bulliou.

THA Superior Conrt of Pierce coonty, Wash., has returned a verdict for Albert Richardson for $10,000 damages in his suit against the Carbon Hill Coal Company. Richardson snstained injnries while in the employ of the company two years ago that crippled him for life. The coal company is owned by the Sonthern Pacific Railwsy.

THA Osborn Hill Mining Company, at Grass Valley, will show a qnartz specimen at the Midwinter Fair, 7 feet long, 2½ feet wide and 18 inches thick. It will weigh abont 2 tons. Some free gold is ehown in the quartz. T. J. Ahern, who performed the difficult work of quarrying out the specimen, says it will be exhibited in its present shape without being polished.

HANRY BAATNOBER, manager of the Mining and Financial Trust Syndicate, London, who is now in the city, says the price paid by the syndicate for the Harqua Hala mine was $900,000. Tbe syndicate has in all invested about $60,000,000 in American properties. Of this amonnt it paid $2.000.000 for the De Lamar, $1,000,000 for tbe Elkhorn and $900,000 for the Harqna Hala.

A DISPATCH has been received from New York announcing that D. H. Moffatt and Eben Smith had sold the Victor mine, one of the best at Cripple Creek, to an English syndicate. The price is uot stated, bnt is snpposed to be $1,000,000. Moffatt and Smith paid $50,000 for the mine, and it has yielded a profit of about $50,000. The Mary Davin mine at Cripple Creek has just been sold to George Mechen of Cbicago for $50,000.

DR. BANKS of Lovelock, Nev., tells the *New Era* that $150,000 have been set aside as a working capital by the National Nickel Company, to be nsed in bnilding redoction works in Cottonwood canyon and developing the company's nickel mines. He also states that the machinery and other snpplies have been pnrchased and are awaiting the order of Sopt. Bell to be forwarded to the mines as soon as the weather will permit.

AT the recent annnal mesting of the stockholders of tbe Andes Mining Company, 94,505 shares were represented, and the following officers elected for the ensoing year: Nat T. Mssser, president; William Edwards, vice-president; and Herman Zadig, William S. Lyle and C. O'Connor, directors. J. W. Twiggs was re elected secretary and Jossph Ryan superintendent. The secretary's financial statement showed a credit balance of $4273.30.

AT the recsnt annnal meeting of the stockholders of the Gould & Cnrry Mining Compauy, 79,052 shares were represented, and the followiug officers elected for the ensuing year: H. V. Havens, president; Charles H. Fish, vice-president; and Thomas Anderson, Thomas Fish, J. N. Sonther, Herman Zadig and A. K. Durbrow were re-elected directors. A. K. Dorbrow was re-elected secretary. His finaucial statement showed a credit of $5910.98.

THA statement is printed that as the resnlt of an assay made in this city the owners of the Sheep Ranch mine in Calaveras county find that for years they had been throwing away as worthless volcanic ash carrying from $5 to $6 a ton in gold. This ash or capping lies over the auriferous gravel in which is foond gold. It was snpposed to be worthless. The resnlt of the assay therefore caused great snrprise. Specimens of the ash may be seeu at the State Mining Bnrean.

AMONO the interesting specimens recently received at the State Mining Bnrean is a piece of gold qnartz from a chnte in the Plymonth mine in Amador conty. Otber specimens are pieces of gold quartz from the Bay State mine in Amador coonty, and a sample of anriferons vein matter from the Kennedy miue. A piece of slate from the footwall of the Keystone mine is interesting as a cnriosity from the fact that, instead of splitting off smoothly, it is corrngated.

AAOUMANT has been begnn before Judge Morrow in the United States District Court in an action in eqnity bronght jnst ten years ago hy Jane M. Gray of Virginia and twelve others, residents of that State and of New Jersey, against the New Almaden Qnicksilver Mining Company. The plaintiffs claim that they are entitled to one hnndred and fifty-four four-hnndredths of the New Almaden mines near San Jose by virtoe of a title from the Mexican Goverument, March 21, 1850, to a tract of land known as the Rancho de los Capitancillos, on which the miues were discovered.

Photography and Mining Reports.

TO THE EDITOR:—The art of underground photography has of late made such progress as to deserve the special attention of mining engineers. By its aid they may now illustrate their reports with pictures plainly showing the exact appearance of ledges, ore bodies and other featnres of importance; and if the practice of employing such illustrations once becomes general, the value of mining reports will be considerably enhanced. Indeed, I doubt not that in the near future no mining report will be considered satisfactory if it be not fully illustrated by means of photography.

As an example of the excellent results now obtainable, I send you a copy of a report I have just made upon the Mayflower and South Mayflower mines on the great "mother lode" in Amador county, California. This report, as you will observe, is illustrated by some exceptionally fine photographs of points uoderground, and I trust you will permlt me to add that in the event of any of your readers being desirous of having a copy, I shall be very happy to supply the same, free of any charge, as I think that by so doing I shall be aiding mining engineers in general. STEPHEN H. EMMENS.

165 Crocker Building, San Francisco, Dec. 15, 1893.

Underground Photography.

Written for the MINING AND SCIENTIFIC PRESS by Newton W. Emmens.

In 1892 I wished to secure some views of the underground workings in some of the bituminous coal mines of Pennsylvania by means of the "flash light." At that time I was in the habit of using the flash powder made by the Scovill Maoufacturing Co., consisting of powdered magnesium and some powerful oxidaot, such as nitrate of soda, chlorate of potash, etc.; but when I attempted underground work with this material I found that owing to the blackness of the coal there was not enough light to make a negative sufficiently strong to print from. I also discovered that it was impossible to tell just *when* the flash mixture was going to ignite, as the fuse employed was very uncertain in its action and sometimes went out altogether without firing the powder. This sort of thing was not sure enough for practical work, so I determined to use *pure* powdered magnesium, in a lamp so constructed as to enable me to get one or more flashes with once charging and thus obtaln as much light as I might desire for each exposure.

The lamps I now use are known to the trade as the "Standard Flash lamp;" and they do their work fairly well, although I find that they do not consume all of the magnesium fed into the flame. The apparatus consists of a vertical cylinder 13·26″ in diameter and 2½″ high into which the magnesium is placed, the top of the cylinder being then closed by a rubber stopper through which two pipes run. One of these is connected with a hollow rubber ball by means of a flexiole tube, and the other is suitably curved and flattened to serve as a jet or nozzle through which the magneslum is ejected into the lamp-flame. Near the upper end of the cylinder, on the outside, are soldered two small sockets, one of which receives a wire carrying a metal reflector, while the other, on the opposite slde of the cylinder, is the support for the lamp proper. This latter consists of ao annular tin box 2¾″ in diameter filled with lamp wick, thus making an Argand burner. The wick is saturated with alcohol and lighted; and then, on squeezing the rubber ball (the cylinder of the lamp having previously been about two-thirds filled with powdered magnesium), a portion of the magnesium is blown into the flame and is lighted, thus causing a flash of vivid light. By squeezing the rubber ball slowly or quickly a long or short flash can be produced at will; and, as an air valve is provided in addition to the exit tube, the number of flashes that may be obtained by alternately squeezing and releasing the ball is only limited by the amount of magneslum in the cylinder.

When taking the pictures that illustrate this article, I used two Standard lamps arranged in such a way that they were both fired at the same time from one ball. This I effected by using a small brass tee to connect the two tubes from the lamps with a third tube terminated by the ball. I was thus enabled to place my lamps at any distance up to ten feet apart and so secure equable illumination and moderate shadow intensity. I may, however, remark that it is desirable to have the lamps as close as possible to the subject to be photographed, while taking care not to allow them to come within range of the lens. In the absence of this precaution the plate is liable to be hopelessly fogged.

Plate I depicts a vein of gold quartz in the 800-foot level of the Gover mine, Amador county, Cal. The camera, owing to the width of the drift and to my using an ordinary view lens instead of a "wide-angle," was placed about 20 feet back from the face. The lamps were set about four feet apart on the floor of the drift, in front of a projecting mass of rock, which made an excellent shield between them and the lens. The number of flashes given was eight and the duration of each was abont half a second.

Plate II shows an electric pump at the 500 station of the Gover mine, Amador Co., Cal. The camera was placed on the opposite side of the shaft from the pump, at the entrance to a short drift. The lamps were placed about three feet apart on the cross plece of a set of timbers one foot behind the camera and ten feet above the floor of the drift. I gave six flashes of about half-a-second duration each.

In plate III, which shows the breast of the east drift at the 300 level of the Mayflower mine, Amador county, Cal., the lamps were placed close together on a pile of attle about four feet in front of the camera and two feet above the floor of the drift. I stood between the lamps and the lens in such a way as to prevent any direct rays of light from enterlng the camera. It will, though, be noticed, on inspecting the picture, that the flames of the candles are very distinct. This is a matter of some little surprise to many persons, as it seems to be the general belief that all lights must be put out when taking a flashlight photograph—a mistaken idea, seeing that the light from a candle is not sufficiently strong to injure a plate. I have even gone so far as to take an interior while a large arc light was in full blaze, and the resulting picture showed no ill effects from the illumination.

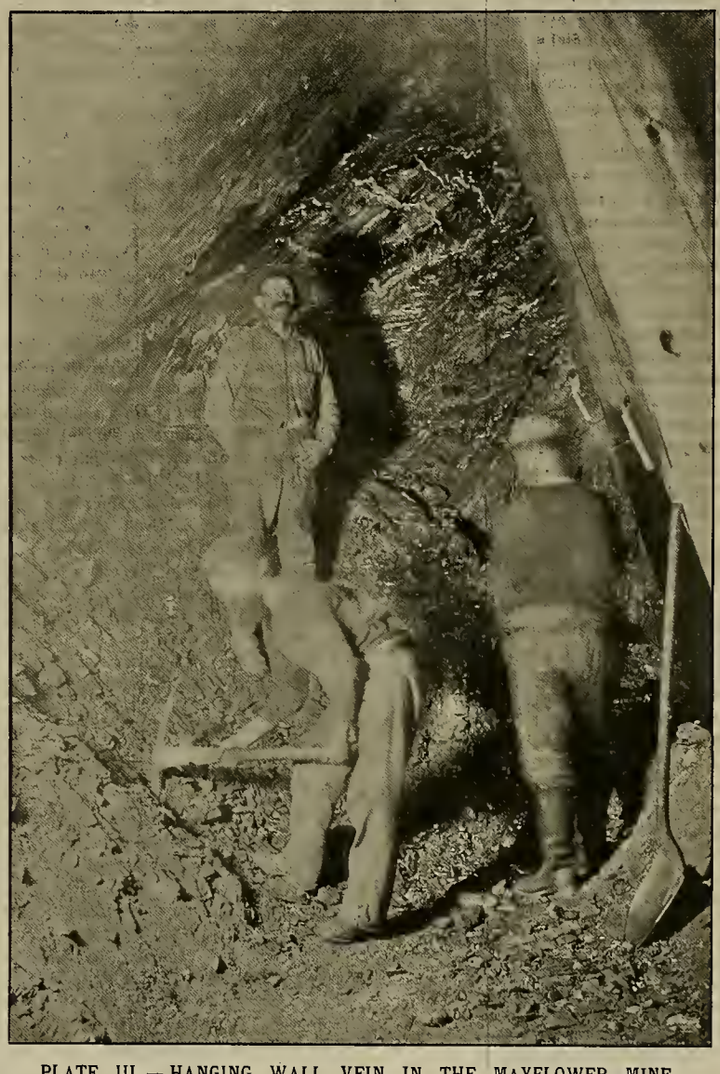

PLATE III.—HANGING WALL VEIN IN THE MAYFLOWER MINE.

In taking the pictures here given I used a Bausch & Lomb universal lens, 8½-inch equivalent focus, with stop No. 16 or F. 16, and a Seed 26X plate. The developer used was Eikonogen and Hydrochinone, Carbutt's formula.

I may also mention that I took the precaution of carrying a supply of developer, etc., with me, and was thus enabled to develop my pictures in my room at the hotel in the evening after dark, so that, if necessary, I could retake any pictures that did not come out well.

NEWTON W. EMMENS.

Tin Mining and Tin Smelting Described.

Tin mining and tin smelting, as far as Cornwall is concerned, are two distinct industries, says the London *Mining World*. The miner raises the tin from the mines, which is always associated with other minerals and impurities, but by a process called dressing, which consists first of reducing the ores to a very fine state, then by a series of washings, the lighter particles, which are the impurities, are largely got rid of. Calcining is then resorted to; this process drives off the sulphur, which more or less is found with all ores. It also facilitates the separation of the iron associated with the ores. After the calcining process the calcined ore is again subjected to a washing process until the tin ore stands as about two to one of the impurity; in other words, in this ore, which is now called black tin, there is about 13 cwt. of clean tin to each 20 cwt. of tin ore, or black tin. In this state it is fitted for the smelters and, assuming the mine owner purposes to dispose of his tin by what is known as the private method, it is taken to the smelter decided on, who makes an assay of the ore to ascertain the amount of metal contained in each ton of black tin. In fair-quality ore this amounts to 13¼ cwt. of metal. This is called the "produce." Of this produce the smelter takes for himself 1¼ cwt. to cover the cost of returning charges, and pays the mine for 12 cwt. only. The value of the metal is arrived at by taking the standard price, or the price rulling in the London market for the time being, the smelter taking care to reserve as large a margin as possible in his own favor, which, previous to the introduction of tin ticketing, ranged from £10 to £14 per ton, probably averaging about £12; that is to say, if the price of tin in the London market was £76 per ton, the price paid to the mine by the smelter would be £64 per ton.

Gold Mining in British Guyana.

TO THE EDITOR:—Kindly permit me, through the medium of the MINING AND SCIENTIFIC PRESS, to reply to several letters inquirlng about the mines of British Guyana. British Guyana lies almost under the equator, and in the zone of greatest precipitation, and ls therefore extremely hot and moist and unfit for white men to work in outdoors. The average annual temperature is abont 80 degrees. Fever and ague are very prevalent in the wet season in the mining districts, which lie from 50 to 150 miles inland. Along the coast the country is low and flat, but it rises gradually into hilly country in the mining districts, which are only a few hundred feet above the sea level. Negroes do all the work and are paid at rates varying from 40 to 80 cents per day. There is no demand for white labor. The gold is obtained from placers in small creeks and gullies, at a depth of from two to ten feet. The ground is patchy, but at times very rich. Rich qnartz specimens have frequently been found in the placer gravel, but no large bodies of payable quartz that I know of. The output of gold for 1891 was about 104,000 ounces; 1892 gave a slightly higher yield, and I believe a still higher return is expected for 1893.

The country is covered with dense tropical forests, through which trails have to be cut, so that prospecting is no plcnic. The mining regulatioos are full of vexatious restrictions and would do honor to the Czar of Russia, or some tyrant of the dark ages.

As to route, I believe that steamers run regularly from New York to Georgetown. In conclusion, notwlthstanding the general depression and bad times here, I would advise no one to leave the United States until he has found a better country to go to. WM. HEPBURN PRENTICE.

San Francisco, December 14, 1893.

REPRESENTATIVE BELL, of Colorado, who is autbor of the suspension of assessment work law, says that it is not necessary for claimants, in filing notice of intention in good faith to hold and work their claims, to prepare separate notices for eacb claim, in cases where several in tbe same district are under one ownership. One notice is sufficient. Representative Bell speaks of "affidavits" in such cases. But the law says nothing about affidavits, simply requiring a "notice." Tbe form given in the MINING AND SCIENTIFIC PRESS November 18th will no doubt be found sufficient.

The Grass Valley Mining District.

EDITORIAL CORRESPONDENCE.

GRASS VALLEY, December 15, 1893.

The mines of Grass Valley have records as steady and remunerative producers equalled by no other district in California, and, therefore, in the world. The district has within its limits the oldest continuous working mine in the United States. It has the deepest gold mine in the world. It produces now more gold than any other camp of like dimensions in the world. And its mines appear just as far from exhaustion as any anywhere. The Grass Valley district is second only to the famous Comstock in fame and aggregate output, the former being $350,000,000 in silver and gold, the latter in the neighborhood of $150,000,000 gold alone. The total gold production of California mines of all descriptions is about $1,300,000,000, of which the greater part has been from hydraulic and placer mines. The Grass Valley output is solely from quartz mines. It seems destined to maintain its prestige as the most important camp in California.

The foregoing may be described in brief as the chief characteristics of a camp that has for years been a very important center of quartz-mining operations. Much of the earlier history of California was written in Grass Valley, and many who are now prominent in public life were at one time or another identified with its growth and progress. The mines of Grass Valley have made many poor men rich, and they are still making rich men richer. The whole district is now enjoying an era of exceptional prosperity, and the present outlook is that operations will assume a very much larger scale and the total output be greatly increased. Deep mining has long been demonstrated to be a success in this district, and there is a uniform purpose on the part of mine-owners to sink deeper. Mines long idle are being reopened, and many of them have already been placed on a dividend basis, or are certain soon to prove remunerative.

It will be worth while to glance briefly at the history of the district and to inquire into the causes which have conduced to its activity, past and present, as well as those causes which have brought about depression and severe stagnation threatening the life of the industry and the permanent growth and advancement of the camp. The first discovery of gold quartz in California was made on Gold Hill, near the present site of Grass Valley, by a German. There were at that time a few settlers and placer miners in the valley, and the German's find seems to have aroused some curiosity but no excitement. Nothing was done. In September, two men who were digging a tunnel on Gold Hill turned out a very rich specimen. Thence dates the first effort to reduce the quartz. Mortar's and spring poles were used, and $20,000 taken in this crude manner. The first quartz mill in the district (the second in the State) was afterward built. The directory of Grass Valley township for 1865 makes the following reference to the mill:

> The French mill is situated on the west side of Wolf creek, Grass Valley. It was built up in January, 1851, by a couple of Germans for J. Wright. This mill, the second one constructed in the State (the first being built in 1850 in Mariposa county) was a common affair, run by water power, having eight round stamps, each stamp in a single mortar.

It will be noticed that the stamps were round and each in a single mortar. It is probable that this statement will be disputed by some old millmen who claim to know about the origin of the California stamp, and who will say that the stamp at that time had not attained so high a degree of development. This pioneer mill was not a success, but another, erected later by Messrs. Somers, Abbey, and Ridgell, was more fortunate. Other mills followed, and the activity in mining operations was considerable. The town had meanwhile been growing, and in 1855 was large enough to suffer a loss of $350,000 from fire. Thirty acres were swept over, 300 buildings being destroyed. The Alison Ranch mine, one of the most famous producers, was discovered in 1855. It yielded at its initial crushing of 18 tons, at the Gold Hill mill, $6000. In December 62 tons produced $23,000. Previous to 1860, the mine had yielded over $1,000,000. The Lone Jack was at this time a celebrated mine, yielding ore in 1860 worth $100 per ton. The total cost of mining and milling even with the primitive methods then in vogue did not exceed $10 per ton at this mine.

And so the community grew and prospered. With the exception of the conflagration of 1855, the early Grass Valley was not subject to the vicissitudes which visited and all but overwhelmed its lusty neighbor, Nevada City. But it experienced hardships that tested its mettle, and might have crushed a less hopeful and hardy people. The adjacent hills were hives of industry, and employment was given to a very large number of men. The population in 1855 was about 3500—less than Nevada City; but the relative positions of the two towns in the matter of population was later reversed. Many mills were erected and were steadily engaged in pounding ore until about 1864, when there was a lull. The Comstock had been discovered, and it proved a powerful lodestone which a population which loved change and excitement could not withstand. No mine in Grass Valley had reached a greater depth than 400 feet, and the hills were therefore barely scratched. The mines had given little or no indication of barrenness; but hundreds nevertheless fled to the new field. The camp continued to produce steadily for many years, notwithstanding the desertion of a large fraction of its population.

Mr. Samuel Butler, a well-known miner and writer of Grass Valley, furnishes me the following paragraph concerning subsequent operations:

"The spring of 1877 inaugurated a period of great depression in the mining industry in this city. This depression lasted through the years of 1877, 1878, 1879, 1880 and 1881. In the summer of 1877 the famous Eureka mine, which, previous to this time, was considered the richest gold quartz mine on the coast, and which had produced fabulous amounts of gold, suspended operations. This had a disastrous effect on other and poorer mines, and was followed by the suspension of operations at the New York Hill, the Omaha, Alaska on the Colfax road, and, later, by the famous Empire. In 1881 the Empire resumed operations, and from this action sprang the period of prosperity which we now enjoy."

The period during which the Empire shut down, however, was comparatively short. It has been operated since 1864 with only slight interruptions, and before that time produced something like $900,000. The Empire has an aggregate record of something over $6,000,000, and is entitled to be considered as a continuous producer for nearly 30 years. The 2100 level was reached some time ago, and sinking is being continued. It is stated that the rock in the Empire is looking much better than for several years, having shown continuous improvement.

The five mines which now bear the nearest and most important relation to the activities of the Grass Valley district are the Idaho-Maryland, Empire, North Star, Omaha and W. Y. O. D., which are all dividend-payers, and are without exception worked on a large scale and at great depths. They are conspicuous examples of the truth that deep mining is profitable. It may be stated as an axiom that no mine in Grass Valley which has struck a pay shoot just beneath the grass-roots will fail to encounter another under the hard rock which invariably intervenes before lower levels are reached. So far as I have heard, no mine in this district which has attempted deep mining on a sufficient scale has failed to pay heavily; and all mines which have been abandoned, or for other causes are idle, have not attempted to sink deep, and failed, in the sense that these five mines are sinking. It is possible that the Idaho may be cited as an exception to this somewhat sweeping generalization, having been worked out at a depth of over 2100 feet; but, on the contrary, the Idaho is a most convincing illustration of its entire truth. The Idaho is altogether the most interesting, as it has been the most important mine in the district. It has yielded in over 25 years of active operation something like $12,000,000, of which one-half has been clean profit. The notable feature of operations is the method of hoisting. The main shaft is 1115 feet deep on an incline of 68 degrees, barren rock being encountered at the 800 level. At the 1000 level a drift was run 325 feet to the east in barren ground, and on the fissure at that point pay ore was struck. From this point an incline shaft, on the pitch of the ledge, was commenced, and continued to a depth of over 1850 feet on the incline, or 1100 feet perpendicular below the 1000-foot level, making the total depth of the mine over 2100 feet, nearly vertical, believed to be the deepest gold mine in the world. The hoist and pumps on the incline shaft are worked by compressed air from the surface, the necessary machinery being placed in a large cavern at the head of the second shaft. The workings of the Idaho mine were long in the direction of the Maryland claim, and litigation arose between the respective owners, the contention being advanced by the latter that the Idaho people were working in their ground. The dispute became famous, and seemed likely to be protracted; but last spring a compromise was effected by which the Maryland bought the Idaho mine and surface works. The terms have not been made public, but it is well understood that the consideration was about $100,000, to be paid out of the profits from the mine—nine-tenths to the Idaho Company and one-tenth to the Maryland, until paid. Meanwhile, the mine has been operated under a provisional arrangement, with two superintendents, each representing the several parties in interest. So successful and profitable has been the operation of the mine during the past eight months (since May 1st) that the entire obligation will be discharged by December 31st, and New Year's day the Maryland Company will enter into permanent possession of the consolidated properties. It is obvious that the present working of the Idaho-Maryland is cumbersome and expensive, because of the distance of the workings from the surface works and the necessity of long hauls and double handling; and there is no doubt that the new owners will, sooner or later, sink on the Maryland proper, and abandon the Idaho workings. It is worthy of note that since the opening of the Idaho, and the payment of the initial assessments necessary for its development, the mine has never failed to pay frequent and regular dividends.

The North Star is now the equal of the Idaho-Maryland in value and extent of operations; and is, indeed, in many respects the bright particular star of the Grass Valley mining firmament. While it is doubtless true, as Mr. Butler states, that the new life began for Grass Valley with the resumption of operations at the Empire mine in 1881, special stimulus was given to the industry by the resumption of work on this mine in 1884, after a long period of inactivity. The North Star occupies much the same relation to the history and activities of the Grass Valley district that the Providence does to the Nevada City district. Its equipment is in all respects model; its management is systematic and efficient. The North Star has abundantly demonstrated the practicability of deep mining, and has now for some years been a large dividend payer. The mill has 40 stamps, which pound out ore day and night. The 2400 level has been reached on the incline. The principal work is confined to the 1900, 2000, intermediate (2050), and 2100 levels, the ledge in each drift ranging from 12 to 16 inches in size. The electric bell system has been introduced at the mine. Instead of a hard pull to give the signals all that is necessary is to press a button and electricity does the rest. Another improvement in contemplation is the lighting of all the mine and works by electricity. About 65 lights will be required. Superintendent Abadie has a very neat and handy contrivance, prepared by himself, showing the underground workings of the mine from the 1800 to 2300 levels. It consists of a series of plates, the work on each level being drawn on its appropriate glass. The model shows at a glance where work is being carried on.

This letter has already been extended to length greater than originally designed, and it will be necessary to postpone until next week mention of other matters worthy of note in the Grass Valley district.

E. B. P.

Dissimilar Occurrences of Gold-Bearing Quartz.

Abstract of Contribution to Discussion of Mr. T. A. Rickard's paper by Mr. Rickard, before the Colorado Scientific Society.

In the course of his very interesting contribution to the discussion, Mr. Argall made a reference to the mother lode of California, and he quoted a remark made by a writer (Mr. H. W. Fairbanks) in the tenth annual report of the State Mineralogist. I do not know upon what facts is based the statement that the veins of that region are equally rich whether they traverse slate, diorite or serpentine, but a two years' acquaintance with the lode structure of the best developed portion of the gold belt—the counties of Amador and Calaveras—induces me to offer the following observations: There is a noteworthy relation—call it a coincidence, if you will—between the character of the country rock and the richness of the quartz veins which it incloses. All along the series of extensive and productive mines, stretching for 20 miles from the Cosumnes to the Mokelumne river, the country rock is a black slate. The vein filling is also of the same character. The lodes rarely occur in the diabase, but rather in the black slate at or near its contact with the "greenstone" dykes. A piece of ore brought by me from the Wildman mine, at Sutter Creek, Amador county, is quite typical of the mother-lode region, and exhibits the ribbon structures and graphitic-slate casing, both thoroughly characteristic of the productive veins.

That "the lodes in the slate are almost entirely composed of quartz, while in the serpentine there is a considerable amount of gangue invariably included in the vein," is a statement which I cannot corroborate. If the lodes of the main gold belt of California have one feature more marked than another, it is the inclusion of country rock and the ribbon structure so produced. In this respect the lodes occurring in slate are certainly no exception. May I mention a personal experience? A mine whose lode was massive white quartz occurring at the contact of an augite schist and a diabase was found poor indeed, but another lode only a thousand feet farther east occurring in a black slate and carrying quartz ribboned with inclusions of country rock was found to be far more gold bearing than its neighbor. This one experience was confirmed by observations made elsewhere in the same region since that time, and also by the experience of the oldest mine managers with whom I discussed the matter. All veins in black slate are not richly gold bearing, but most of the rich lodes are in black slate, and an unnumbered quantity of veins in greenstone and schist have been found worthless. That is as near to a generalization as I dare venture.

The Thames mining district, whose lode structure I

have briefly described, has a geological connection with the Hot Lake region of Rotorua, about 45 miles distant. At Rotorua, at one time famous for its lovely pink and white terraces, there are numerous thermal springs, geysers and fumaroles. The surrounding plain is largely covered with fragmentary andesite and rhyolite. This material is for the most part loose and unconsolidated. Near the edges of the fumaroles, however, it has become cemented, and here very much resembles the country rock of the mines of the Thames. Further, the rims of the fumaroles show products of decomposition identical in character with those observed near the lodes, and which have been referred to as the soft and granular material, often called "tufaceous sandstone" by the miners.

While at the Thames the andesites are usually brecciated, it must be added that solid andesite rocks also occur occasionally. The latter often gradate into the former, and appear to have penetrated through them, recementing them. This region very forcibly suggests the inter-relationship observed elsewhere between young eruptive rocks, thermal springs and lode formations. The accurate study of this association of geological phenomena would do much to give us definite ideas on the subject of the genesis of ore deposits.

Turning to the note which I offered on the subject of the Ballarat "indicator," I would wish to refer to a description, which I only saw a few days ago, of a very similar occurrence in a neighboring mining district. In the Quarterly Report of the Victorian Mining Department for December 31, 1888, there is a description by Mr. E. J. Dunn, a well-known colonial geologist, of the Champion Reef at Wedderburn. Wedderburn is close to Dunolly, and nearly 50 miles distant from Ballarat. This is a part of Victoria celebrated for the large nuggets which it yielded in the early days.

Mr. Dunn gives a vertical section which has many features resembling the sketch made by me in the New Normanby mine. He says that "it shows the influence of the band of country rock called the 'indicator' on the productiveness in gold of the intersecting quartz leaders." In parenthesis I would say that the term "leader" as used here is unfortunate. A "leader" is a quartz vein or seam which "leads" a miner. In this instance, the "indicator" itself is the "leader," and the intersecting quartz veins can be better called "cross veins." He continues: "The country rock is of yellow and gray, soft sandstone and clayey beds, having a strike N. 5° W. and a dip 60° to 80° E. One of the beds of rock is of dark gray to black color and from five to seven inches wide, made up of thinly laminated unctuous clay. This is known to miners as the 'indicator.' At intervals of a few inches to several feet apart are flat leaders of quartz, from a quarter of an inch to one foot thick. These dip to the N. W. at angles ranging from 20° to 30°. Where they intersect the 'indicator,' the latter is generally displaced a few inches. At and near the intersections the quartz leaders become auriferous, and often richly so, the gold occurring in coarse nuggety pieces and frequently of crystalline character. The leaders are barren except at the intersections with the 'indicator,' or of nearly vertical thin quartz veins called 'droppers' by the miners. A portion of the 'indicator,' on assay, gave only a trace of gold, unweighable, but this result is nevertheless regarded as important, showing the actual presence of gold, in however small quantity, in a particular band of the country rock, in contiguity with which bands the quartz veins are found richly auriferous."

I must ask pardon for so long a quotation, which is only permissible because the geologist quoted is one of the most accurate of observers, and because it very completely confirms the note which appears as a part of my paper. To that note I may make the following additions:

Though at the level where I obtained my sketch the "indicator" is only slightly dislocated by the cross veins of quartz, yet in other parts of the New Normanby mine there are floors or slides which throw it for from 12 to 25 feet. These faults have a strike and dip similar to that of the cross veins. While the latter at the 700 and 800-foot levels have a flat dip to the east, yet nearer the surface they incline west. The "main lode" of the mine, a fissure vein cutting across the bedding of the country rock, is less profitable to exploit at the lower levels than the line of the "indicator" where intersected by cross veins; but at surface, the 50 feet of country separating the "main lode" from the "indicator" was so richly gold-bearing as to have been all removed by open cuts.

The association of organic matter with ore deposits has been often pointed out. In this instance, the observations above recorded may be summarized by saying that both in the mines of Ballarat East and in those of Wedderburn, places nearly 50 miles apart, gold is found to occur in notable quantities wherever cross veins of quartz intersect a thin seam of graphitic clay or slate which is conformable with and forms part of the bedded sedimentary rocks.

The New Gold Fields of Western Australia.

[From the Prospectus of a London Mining Company.]

Western Australia is a *terra incognita* from the mining point of view, even to those persons who claim to be most intimately acquainted with that industry. And yet all kinds of minerals exist therein, and at the present time the total area of the proclaimed gold fields, as we gather from the Government blue-books, now exceeds 130,000 square miles. It was only so late as 1886 that any attempt was made to develop the known resources of Western Australia, but the results so far rival those obtained in the same time from almost any other gold field that can be named. For example, in the 17th year following the discovery of the South African gold fields the production is stated to have been 200,000*l*., while the gold fields of Western Australia, which have scarcely attracted any public attention at all, exceeded that sum in their seventh year of working, and also in their first seven years of working raised more gold by 70,000*l*. than South Africa produced in the first 14 years. Notwithstanding the enormous sums poured into South Africa for the development of its mineral wealth, the above facts stand out prominently; and yet in Western Australia the dearth of capital has been most marked, and there has, in fact, been no attempt of anything like a deliberate kind to obtain it. The money used in working the mines was subscribed locally, and from its expenditure results that are almost wholly unknown to English readers have been produced of a very satisfactory kind.

Let us refer, for example, to the Yilgarn, the Murchison and the Coolgardie districts, which are at present the most noteworthy of the West Australia gold fields. Dealing with Yilgarn first, we have before us the returns of six mines, which, between them, crushed 29,161 tons of ore, the yield of gold being 29,801 ozs., the value being 109,130*l*., and the average yield per ton 1 oz. 1 dwt. 14 grs. This is the return to the end of July, 1892; but far more remarkable to state, the return for the half-year ending June 30, 1893, was 21,070 ozs., being more than double the return of the previous six months. We have little to say about the Murchison gold field, which was only proclaimed in September, 1891, but during the first 11 months of 1892 the gold recovered was worth 80,000*l*. This field is described by the Government geologists as "exceedingly rich." To the Coolgardie field considerable attention has been called of late, in consequence of a very rich discovery made about 112 miles from the Yilgarn Railway. The discovery was made by a man named Bailey, who sold his claim to Mr. Sylvester Browne. Ten thousand ounces of gold have been obtained in six months from the reef, without a battery and without machinery, equal to treating only 200 pounds of stone per day, exclusive of 2500 ounces of gold obtained by Bailey before the sale. Public opinion in the district, and to a large extent outside of it where the facts are known, is disposed to rank the Coolgardie gold field as about the best on the Australian continent, while its richness, so far as developed, is said to eclipse anything that has been known before. About 3000 men are now on the field, to which, of course, there has been the usual rush.

So far, we have dealt with these gold fields in a somewhat general way, but we propose to refer to the views expressed in one form or another by some of the leading men in the colony. For example, Sir John Forrest, Premier of Western Australia, describes it as "a rich mineral country," and basing his opinion on this fact, he adds, "It seems to me that even those who are most sanguine can scarcely foresee what will be the destinies of this part of Australia." Speaking about a year ago, the Premier said, "Gold is now being found in so many localities, and in such quantities, that it is likely shortly to become the greatest factor in our prosperity." His Excellency, Sir William C. F. Robinson, at the opening of Parliament in July last, spoke of Western Australia as likely to become "one of the greatest gold-producing parts of the world." The Premier so late as August last said, "The export of the gold from the colony during the 12 months ending June 30 amounted to 276,807*l*, an increase during the past year of 105,408*l*." These are the testimonies of persons in supreme authority, and now we come to those of experts of established reputation. Dr. E. D. Peters, writing to an American paper, of the Coolgardie gold fields, says, "There is every reason to believe that a new gold field has been opened up of greater richness and extent than anything that has been discovered in Australia since its early days." Mr. W. E. Fallis carefully inspected one of the reefs of the Coolgardie estates and found it to be a true fissure, carrying free gold. We might go on quoting many other testimonials, but will only add that of Mr. Sylvester Browne, who, when interviewed with regard to the Coolgardie gold fields, is reported to have stated, "There are numberless reefs and all of good size." He added, "they invariably carry gold," and said, "this is going to be one of the finest reefing fields ever discovered in Australia."

Mines on the Lower Colorado River.

IN TWO PARTS—PART II.

The Picacho Mining District.—One mile above the "Azure King," on the California side of the Colorado, is the ten-stamp mill that ponnded out much gold in early days. Three miles westerly over a good "wash" wagon road, clustered near the base of "Chimney Peak," or Picacho, are the mines. These mines produced good pay from several rich and extensive chambers, but are now holding a low-grade ore, though specially free in gold. Doubtless systematic exploiting by a thoroughly competent superintendent, with "no strings on him," would result in the discovery of other ore chambers of like extent and value. There's the rub! A self-respecting, competent mining man does not care to exploit "has been" mines through orders from parlor miners in New York, who don't know the strike of a ledge from a railroad strike. That there is a future for the quartz mines of Picacho district the writer has never doubted. An English company, at great expense, have erected a pumping plant at the river to ground sluice for the gold that is certainly of good value in the gulches and impregnating the gravel mesas of this district. The success of the venture will hinge on the management of the enterprise in its inception. If they have not secured the services of some eminently qualified practical hydraulic engineer, it may be written down a failure. There is too much expense, too many leaks, in this method of lifting for miles the volume of water required in placer mining, to monkey with any experimental measnres. In all probability it will ultimately pay—provided our English cousins do not weary of assessments.

Three miles yet to the north, and 50 miles by river to Yuma, and 30 miles by trail on the California side, we find the village of Mortons Landing, maintained solely and alone from the produce of the mines of Silver district.

Silver District.—Mortons Landing has a postoffice and the general supply store of Levy & Casaras, a public school of 25 pupils, and the largest settlement between Yuma and the Needles on the Colorado river. The mines are five miles westerly over good wagon roads. The veins of this district are remarkable for strength and continuity. There is a system of four parallel ore channels, cropping boldly with an average width of 20 feet between walls, and a northwest and southeast trend, clearly defined, with unbroken croppings, three to five miles in length. In the southeastern part of the district the ledges are in a contact of porphyry and granite, where the "soft" or smelting ores are had. The granite pinches out and the porphyry gives way to trachyte, as the ledges reach north and the ore changes to a "dry," free-milling silver chloride, with not two per cent of lead, as shown in the Clip, Rooster and New Deal claims—an excellent illustration of the influence the inclosing walls of a mineral has on the kind of ore deposited. The general country formation is porphyry.

The "Red Cloud" mine, leased by Judge Levy and sublet to working men, on royalty, is the principal producer. From 60 to 100 men are constantly at work in and about this mine.

The average value of shipments is high, about 100 onnces silver and 60 per cent lead per ton. Here are the values of some of the last shipments, from samples submitted to the writer by the miners, in different lots:

132	ounces	silver	.....	56	per cent lead.
170	"	"	.....	45	" "
174	"	"	.....	58	" "
240	"	"	.....	64	" "
288	"	"	.....	66	" "

No assays were had lower than these. New finds are being made by underground workers. The last assay given, 288 ounces, represents an ore chimney lately uncovered by Manuel Velusco, having from four to six inches of this ore in place, though it may be remarked that Velasco, a skilled miner, worked with varying success for several months, driving for this rich chute, before finding it. It is in this haphazard tribute way in which this mine has been operated. This magnificent property for years has been handled in this desultory way. There is clean metal at the water level, 400 feet deep. The ledge is strong here between smooth granite walls, and unexplored ground above. From the old "Remnant" samples of ore shipments were assayed by the writer, the returns giving

No. 1—	171	ounces	silver	.....	46 per cent lead.
No. 2—	665	"	"	.....	—

There is but little soft ore in this mine, principally a silver chloride and glance in an iron manganese, spar and quartz gangue stuff.

This is essentially a low-grade mining camp. In its entirety, the ores are smelting and milling and we write only of those mines now shipping, simply referring to the "Clip" and "Rooster," with above a year's run of 20 stamps, of 12 to 30-ounce ore in place in the mines. Five feet of 40-ounce ore are exposed in the "Deal," 17-ounce ore in place on the "Parnell," uncovered by shafts and cuts, and numerous lesser deposits are known to exist, of free milling

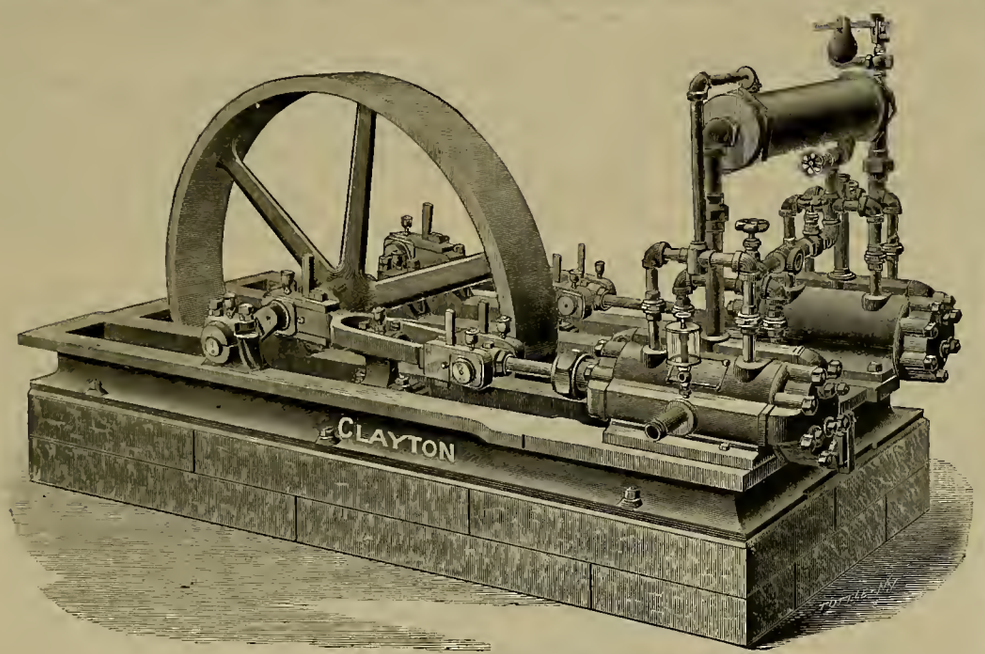
chloride of silver ore, in the camp. These will he made to pay when silver shall have somewhat recovered its old old standing and real worth.

Old Johnston Camp, adjoining Silver district to the south, is a clear smelting deal in porphyry and slate. The ore is in small seams of clean metal, though regular and strong, and from which much good ore of 40 to 80 ounces silver, and 658 per cent lead has been and will he shipped for many years to come.

Now, let the reader bear in mind, all of the districts mentioned have not one company with any pretense of capital behind it, with the exception of Judge Levy and Vomocil, both of whom came to this country poor men on day's work; hence a living illustration of what thrift and rustle may do. The mines now shipping, and thus supporting so many of our citizens, were carried by our merchants of Yoma until such times as they became independent, and the merchants deserve to, and have been, well repaid for their confidence in the resources of Yuma county.

This letter is written that inflowing capital may know that not in citrus possibilities and agricultural fields is Yuma county alone rich, but that money judiciously invested will return a good profit from her mines, and there are many such to be had that will repay investigations throughout the county. We write only of the mines directly tributary to Yuma, and which the writer has personally examined.

Again, remember all these mines are easy of access, are



CLAYTON BELT-DRIVEN DUPLEX AIR COMPRESSOR.

free ores, no antimony, arsenic, zinc or other refractory minerals to combat and reduce their values. Labor is cheap; miners $2 per day; no strikes; work continuing without cessation the year through. And what is written of Yuma county is more or less applicable to southern Arizona.

TAYLOR D. MACLEOD.

San Francisco, December 11, 1893.

Forest Conservation.

[An Essay by Abbot Kinney, Lamanda Park, Los Angeles County, at the Los Angeles Convention of Fruit-Growers.]

The importance of a conservative forest policy is nowhere greater than in California. It is now fully established by the forest experience of France, Germany, India, Australia, etc., that judicious management will give a high and perpetual product of bark, fuel, tar, timber, etc., from the forest without injury to the forest reserve.

As great as is the value of a perennial and secure source of forest products, and as much as we may esteem the forest from a sportsman's side or regard it from the sentimental or sanitary view, it is all as nothing to its influence on the delivery of the rainfall from a country's watershed.

A forested watershed will deliver a given rainfall regularly and slowly over a long period as compared to the delivery of the same rainfall from the watershed deforested. The trees, roots and humas detain and divide the rainfall, so that the water has time to he absorbed into the soil and rock veins. Thus in a forested district there are none of the harrancas and gullies generally in a bare country. In California we have gullies and washes in the southern section with little forest and small rainfall, while at Mt. Shasta, with 60 to 90 inches of rainfall and a mountainous forest, these land scars are practically absent. On a bare mountain watershed there is little opportunity for the rain to be absorbed or for it to replenish the springs and sources of perennial water supply, consequently the rainfall from such a district is delivered suddenly and in a short time, and we have dangerous and destructive floods. As a watershed is without forest the delivery of its rainfall is uncertain and injurious.

We are quite safe in saying that in California "As the mountains are deforested so will the perennial character of the springs and streams diminish or he lost, while on the other hand floods and torrents will increase in force and destructiveness. The water flowing regularly from the forest mountain is the aid and servant of man in his mill, house or field. The water tearing madly over the denuded rocks of a bare and arid declivity is his scourge and his destroyer.

In the first report of the extinct Board of Forestry a number of domestic and foreign instances are collected showing the damaging effect of undue forest denudation. Our brush or chaparral acts as a forest in delaying the delivery of the rainfall.

Some time before the abolition of the State Board of Forestry the friends of forestry in California concentrated their efforts on a national system of forestry. Colorado has gone hand in hand with us in this work and participated in the results attained. We have achieved something important. We have secured the adoption of a policy of making forest reserves. The Federal Government has reserved large districts of land on the western mountain watersheds for the first time for forestry purposes and called them forestry reserves. In California, south of Merced, the most important mountain watersheds are now Government forest reserves. The Government has also taken the first step in recognizing its duty of protecting the public forest domain. The Yellowstone reservation and the Yosemite with its large additions are now efficiently and cheaply guarded by small detachments of cavalry. The result of these patrols in preventing forest fires has been very marked, and has demonstrated that these wasteful and destructive forest fires were mainly due to irresponsible sheep-herders. The exclusion of these herds from the Yosemite addition ended the danger from fire.

These matters promise well for the gradual establishment of a self-sustaining, scientific forestry system for the United States.

Nowhere is a conservative system of forest management more important than in a country of steep mountains alternating with fertile plains. When to this condition is added that of alternating dry and rainy seasons, under which irrigation becomes an important agency in agriculture, we have paramount reasons for a forestry system.

We say in a general way that the more difficult it is to create or maintain forests on mountain watersheds the more important these become to preserve the perennial flow of springs and streams and to diminish or prevent floods and torrents.

The blue gum is still the most valuable addition to the forest flora of California. We have indeed demonstrated the superiority of *Eucalyptus Robusta* in situations exposed to the sea influence, on the one side, and the superiority of the *Eucalyptus Corynocalyx* (Sugar Gum) in resisting drouth on the other; but the Blue Gum is still king of rapid growth, available in most of the settled districts of southern California, quickly available for firewood, and eventually, in favorable situations, valuable as lumber. It is the tree giving the promptest results of any known in the State. It comes easily from the seed and gives the best results when planted small, and is therefore a cheap tree for forest planting. When some plantations of Blue Gums are made in favorable locations, say in a burnt-over redwood district or in any damp location on the central California coast, we may expect to get trees similar in grandeur to those of Tasmania, where the Blue Gum often surpasses 400 feet in height. It is not generally known that the Blue Gum is a close competitor for the glory of being the tallest known tree.

The introduction of insect pests, while introducing foreign plants, has been the cause of damage and injury to the State. Often this damage has far exceeded any possible benefit to he hoped for from the plant introduced. To obviate this, let me suggest the advantage of adopting the policy from which I never departed in introducing foreign plants to this State—that is, by the seeds alone. I have no knowledge of any insect whatever as ever following the distribution of forest trees grown from our examined seed. Such a policy would make little difference in time and result in much added security, not only to forest trees but apply to all other plants. I am decidedly opposed to the importation of nursery stock from any infected district, and I believe that every foreign district producing nursery stock should he deemed infected until proven otherwise.

The importance of forestry is a thing no Californian can afford to lose sight of. Every city, village, home, orchard and field in southern California is subject to damage or destruction by unwise forest denudation. Such destruction may come through diminished summer water supply or by excessive flood delivery of water or the creation of new torrents, as has already taken place in our section. With all our mountains bare, there is no place here that would he safe. Let us join, then, in advising our federal representatives on this vital matter.

A New Clayton Compound High Duty Air Compressor.

Builders who formerly manufactured a general line of machinery are now very largely devoting all their ingenuity and capacity to some one type which they have excelled in producing. The Clayton Air Compressor Works of New York, at that time builders of steam pumps and general mining machinery, introduced the first Clayton air compressor in 1871. The rapidly broadening field of usefulness for compressed air created a growing demand for high-class air-compressing machinery, and soon caused the Clayton works to discontinue all other lines and concentrate the entire capacity of their plant to the construction of air compressors. Since this time they have made this type of machinery their specialty, laboring constantly to attain a higher plane of general excellence and adopting every improvement that would raise the standard of their machines. Among the numerous special designs which they are continually placing on the market is a compound belt actuated air compressor, which we illustrate herewith.

This compressor is intended for experimental and other duties in which air is used under pressure as high as 500 lbs. per square inch, where it is preferred to operate the compressor by belt power.

Two parallel cylinders are employed as shown, as in regular pattern of duplex compressor, one cylinder compressing the air to 80 lbs. pressure and transmitting it thence through the cooler shown above the cylinders to the second or high-pressure cylinder, which completes the compression. The cooling apparatus combines the most efficient devices known for extracting the heat of compression from the air in transit, and the cylinders are surrounded with the latest improved water jackets for absorbing the heat of compression by an external circulation of water around the cylinders. The suction valves are of the poppet style and are designed especially for durability and tightness under high duty; they are equipped with the Clayton patent safety stems, absolutely avoiding the possibility of a valve falling into the cylinder, and reducing clearance space to a minimum by permitting the pistons to run close up to the cylinder heads. As an extra precaution the main valve stems are fitted with both flange nuts and jam nuts. The pistons consist of a series of metallic rings of a composition made especially for the requirements of the duty. The connecting rods, bearings, etc., are all in accordance with the latest steam-engine practice, and the entire machine represents the continued progress of the house. A similar design of steam-actuated compressor is constructed for operation by direct steam connection.

Another design of compressor recently brought out by the same makers is a triple compression cylinder compressor for liquifying carbonic acid gas, which has many excellent points.

Scientific Progress.

Do Species Exist?

Prof. David Starr Jordan, of Stanford University, lectured in this city last week on evolution. Darwin, said the lecturer, once wrote a monograph on barnacles in which he tried to describe all the barnacles in the sea. He wrote:

"This systematic work would be easy were it not for this confounded variation, which, however, is pleasant to me as a speculatist though odious as a systematist."

He could not depend upon his barnacles; they were always varying. After describing a set of forms as a distinct species, tearing them up and making them separate, and making them over again, I have gnashed my teeth, cursed species and asked what sin I had committed to be so treated.

While writing to describe many species, and at the Arlington Hotel, Santa Barbara, the floor of my room was covered with letters rejected because each new individual made the prior description useless.

The crucial test of the development theory is the fact—does one species change into another? Species generally means a kind. The word was used first about 146 years ago by Linnæus, who, in a sense, was the founder of modern zoology on account of his system of recording. In animals of a limited district, such as eastern Sweden, there is no difficulty in telling where one species leaves off and another begins. Differences may be simple, but they are constant and apparently permanent.

In the system of Linnæus there was no doubt as to species being a definite thing, and he says that there are as many species on the earth now as there were different forms created in the beginning, that each species had been separately created by the hand of God and had not undergone change. Linnæus did not know of extioct species, nor that comparatively only few species are left. Linnæus recognized the idea of variety dependent on geological limitations, climate, etc. In the genus homo he recognized homo sapiens, the aborlginal man, and homo troglodytes, the ourang-outang, and of the former he recognized five varieties.

Cuvier recognized that species uoderwent variations, and thought that modern species could have descended from extinct species. Cuvier thought that there were as many species of animals now as there were different formations created at the beginning of each geologic era, which he believed to be about fifty.

Lamarck in the Paris Museum ran across cases where a shell in one country would gradually undergo changes until it became something quite different and that these variations were just what they appeared to be on their face, modification by climate.

In the days of Cuvier the difficulty of the men who maintalned the descent of species was to show the things causing the change. Whatever the factors in evolution were not shown until the time of Darwin, Lamarck's exploration was not regarded as sufficient, though Goethe prophesied that the time would come when it would be valued as scientific. This is the conclusion reached by every one who has taken up the study of late years. The reason why it was not discovered earlier is that people neglected the little for the great, whereas the progress of science has been by the collation of small facts.

Darwin's study of the land birds of the Gallapagos islands, off South America, and also of the Cape Verde islands, off western Africa, the persistence of the same species and their resemblance to the anlmals of the continents led him to the conclusion that these birds were waifs of the storms that had taken root there and changed to match the changed surroundings. If you admit that new species can be found up on the islands you admit that one species can be formed from another.

In Australia the mammals are marsupials, the fossil mammals are marsupials, and the lecturer concluded the modern were descendants of the ancients. Shells that in the upper reaches of swift and rocky streams are rough, in the lower and calmer waters of the mouth become smooth, and the transition is so perfect that it is impossible to tell where the one leaves off and the other begins. From these and other data we conclude that time and space bring about changed conditions and forms.

One of the greatest movements in recognizing evolution of species was the Pacific railroad survey. Numerous plants and anlmals were taken to Washington from the greatest stretch along the same latitude line that had ever been known. The birds, etc., were subjected to Professor Baird's minute studies, and certain laws of variation were thence formulated. The paper of Dr. Joel Allen of Harvard on the mammals and birds of Florida in 1874 was a further step in the advance of our knowledge of species.

By means nf hundreds of measurements of specimens he discovered laws by which he could predict the kind of variations in birds in some new places about to be investigated in Florida, and showed that many of these variations were connected with climate. In spite of the early opposition to Allen's theories, ornithologists and others have come to the conclusion that the only test of species is the known presence of intermediate forms.

Illustrations of Professor Allen's laws were given in the shore lark, the blue birds, the meadow lark, etc. In regard to his own conclusion to that belief in evolution of species, Presldent Allen spoke nf his early training under Agassiz in opposition to Darwin's theories, and how he was forced by his experience to take a view contrary to that of his professor. He then explained how fish spread in different rivers, especially how the trout had come from Siberia and worked its way to the Frazer and Columbia rivers, to the Snake and Lewis rivers, to Utah, and by the Colorado into and through Dalifornia and up again to the Columbia and Frazer, where the two now recognized species of trout, the descendants of the original Siberian emigrants and the descendants of the trout that had migrated and spread over the western country, met and lived together as two distinct species.

The variation of words as shown in philology and the various species of anlmals is a very close parallel. There is just as much reason to believe that all the words of the French language were created separately in France, without any relation to Latin or Greek, as to believe in the independent creation of species.

What Keeps Up Natural Gas Pressure.

A docnment just issued by the Smithsonian Institution contains an article by Prof. Edward Orton on the natural gas supply of Ohio and Indiana especially, and the cause of the pressure which keeps up the flow of gas, even through mains 30 and 40 miles long.

He holds that this gas, which exists in the Trenton llmestone rock of a porous nature, is forced out of the rock by salt water which percolates through the rock, being held back by gas in its natural state until the gas pockets or cavities are tapped by wells, when, as the pressure is thus reduced, the water percolating through the rocks continues to keep up the pressure of gas through the wells and in the mains.

He finds that the salt water which is found beneath the gas usually rises in the wells to a height about corresponding with the level of Lake Superior, and his theory is that there is a connection between the water penetrating the porous rocks in which the gas ls found and that of Lake Superior, though it must at first pass over or through salt beds in order tn gain the salt qualities which it cnntains when found in connection with the gas fields. He argues that there is no danger that the great gas reservoirs of to-day will "cave ln" or "blow up" after the gas is withdrawn from them. The gas will not leave the porous rock until the salt water nbliges it to leave by driving it nut and takiog its place.

An Interesting Discovery.

Accident recently revealed to the managers of the Baltimore Copper Works a fact which may have some value in refinlng the metal there handled, says the New Ynrk *Tribune*. At this establishment the reverberating furnaces are connected with a great chimney by means of long underground passages, called "culverts," in which more or less oxidized copper, as well as sulphides, arsenides and other componnds, is carried off in the form of dust and smoke. These are deposited in the culverts, and are subsequently collected to be worked over again. Amld an accumulation of such stuff, a few days ago, there were found iridescent, moss-like masses which upon examination prnved to be pure copper. How the transformation was effected was a mystery, until it was discovered that petroleum, which saturated the soil in the vicinlty (having escaped from a neighboring refinery), had entered the culverts through a crevice. Under the influence of high heat it was volatilized, and the resulting gases had "reduced" the oxides and sulphides into pure metal. It is probable that this revelation will be turned to advantage in future operations.

Mechanical Progress.

The Campania and the Great Eastern.

In a paper nn "Fast Ocean Steamships," in *Cassier's Magazine* for December, Dr. Francis Elgar, a prominent English naval archltect, draws an interesting comparison between the famous Great Eastern and the latest type of modern ocean steamer as exemplified in the Cunard liner Campania. The Great Eastern is the most wonderful instance the world has seen of attempts to obtain high speed over long distances at sea. She was designed 40 years ago, and her name is probably associated in the minds of most people only with errors and disasters. It is universally known that she was remark- for her enormous size; but it ls often forgotten that there was anything else about her worthy of notice or admiration. Every new ship that is built of greater dimensions than her predecessors is naturally compared in size wlth the Great Eastern. The Great Eastern was remarkable, however, not only for the vastness of her proportions, but also for the extent to which problems relating to high speed upon the longest ocean voyages, some of which are at times thought to be peculiarly modern, were understood and worked out by her designer.

In the latter part of 1851, Mr. Brunel began to work out his idea of a great ship for the Indian and Australian trade. He spent two years in inquiries, investlgations and calculations relating to the numerous problems—many of them quite novel then, though more familiar now—that were raised by such a tremendous stride in advance of all former experience and ideas. The magnltude of the stride was as great as would now be involved by the construction of a ship 1200 feet long and of 30 to 35 knots speed.

The length of the Great Eastern, over all, was 692 feet, as compared with the 622 feet of the Campania, and her load draught was 30 feet, as compared wlth 27 feet of the latter. She had accommodations for 800 first-class, 2000 second-class and 1200 third-class passengers, while the Campania is able to carry 600, 300 and 700 passengers respectively. The propelling power of the Campania is fully 3½ times as great as that of the Great Eastern, and her speed is more than 50 per cent greater.

Riveting Pressures.

In a discussion by the Engineers' Club of Philadelphia, on the riveting pressures required for bridge and boller work, Mr. Wilfred Lewis referred to a number of letters received expressiog interest in the subject, and read a letter from Mr. David Townsend stating that he was prepared for the manufacture of rivets to be driven cold, a number of which were exhibited. In regard to the pressure required for driving such rivets, Mr. Lewis recalled some experiments made by William Sellers & Co., Incorporated, between the compression platforms of their testing machlne. A number of ⅞-inch rivets were subjected to pressures between 10,000 and 60,000 pounds. At 10,000 pounds the rivet swelled and filled the hole without forming a head. At 20,000 pounds the head was formed and the plates were slightly pinched. At 30,000 pounds the rivet was well set. At 40,000 pounds the metal ln the plate surrounding the rivet began to stretch, and the stretching became more and more apparent as the pressure was increased to 50,000 and 60,000 pounds. From these experiments the conclusion might be drawn that the pressure required for cold riveting was about 300,000 pounds per square inch of rivet section. In regard to the pressure for hot riveting, he said that until quite recently, within the last decade, there was never any call for a pressure exceeding 60,000 pounds, but that now pressures as high as 150,000 pounds were not uncommon, and even 300,000 pounds had been contemplated as desirable.

A Remarkable Locomotive.

On one of the Kentucky railways is a remarkable little locomotive. It is described by an exchange as having eight wheels, all drivers, but the length of the wheel base, or distance between front and rear axle, is only 16 feet. It weighs but eight tons, being designed to work on steep grades and curves, and has hauled a train of four empty cars, weighing 16,000 pounds, up a grade of 600 feet to the mile and around curves of 50 feet radius, where the grade was 450 feet to the mile, at a speed of 12 miles an hour. It has but one pair of cylinders, which are rigidly attached to the middle of the frame and the wheels are carried under two trucks, one at each end and both able to turn about a center pin like the trucks under passenger coaches. The front and rear axles—that ls the first axle on the front truck and the last axle on the second truck—are hollow, the diameter of the inside being sufficiently large to permit a second axle to run through, the connecting rods driving these interior axles by means of crank pins, and the motion is communicated to the tubular axles by universal joints at their center point. In this manner the inner and outer axles are not always parallel, but the rotation of the former forces the latter to revolve with it. The tubular axle carries an annular crank from which the other wheels on the truck are driven. As the cylinder is midway between the trucks, there is a piston rod on each face of the piston, and the forward stroke for the wheels under the front of the engine ls the back stroke for those in the rear.

Boiler Coverings and Fuel.

The influence of boiler coverings on the consumption of fuel has lately been tested on the railways of southwest Russia, says the Chicago *Journal of Commerce*, and it was found that the cooling was more rapid while working than when stationary, save when a double covering of felt was used. It is reported that the heat in 24 hours by a boiler with 30 square meters of surface containing water at a temperature of 144 degrees and exposed to an exterior temperature

of 8.5 degrees corresponded to 133 kllos. of coal if the boiler was uncovered, to 153 kilos. If there is a thin metal covering, to 130 kllos. in the case of a cork covering. The cooling of the boiler represented about 24 per cent and 8.1 per cent out of an average daily consumption of 1164 kilos. of coal.

New Smokeless Powder.

Plastomenite is the name given to a new kind of smokeless powder invented by a German, Herr W. Guettler. The solution is poured into forms, where it becomes a fairly hard substance, capable of being pressed, rolled, etc. The substance can be colored at will, and is, like celluloid, serviceable for numerous purposes. Plastomenite is used for blasting powder, powder for cannons and rifles, signal rockets, etc. The greatest advantage claimed for it is complete durability, while all other smokeless powders manufactured by the means of ether and nitroglycerine deteriorate. The combustion of plastomenite is also, it is claimed, so well balanced that it leaves no residue in barrel or cartridge, although the striking velocity of the projectile is unusually great. The initial velocity from a 6½ mm. caliber is 715 m., with a gas pressure of considerably below 3000 atmospheres. It is said that neither cold nor hot weather has any effect upon the plastomenite cartridges, whereas all powders containing nitro-glycerine suffer from changes in the temperature. Hitherto plastomenite has principally been manufactured for sporting purposes, but its good qualities have attracted the attention of the German military authorities, and will now be extensively tested in the army.

Compressed Air for Street Roads.

Compressed air is again about to be tried for street railway traction in Paris by the Compagnie des Omnibus, which will shortly run a line of cars, worked by compressed air, from the Louvre to Versailles and St. Cloud, and also upon a connecting line now under construction from the St. Augustin Church to Vincennes. Upon the first-named road the motor cars will be of 18 tons, and, being worked by air under pressure of 1000 pounds per square inch, they will be able to draw two or three trail cars, each containing 50 passengers, or even more whenever there is a rush of traffic. Upon the new line from Saint Augustin to Vincennes single cars will be run, containing at the same time the compressed air, the motor and about 50 passengers. The cars upon both lines will resemble those at present in use, except that the top will be covered in.

Extensive Pneumatic Tube System.

The most extensive pneumatic tube system in the world, probably, is that which has recently been completed at Chicago. It extends from the headquarters of one of the great press news agencies to nearly all of the daily newspaper offices, and is to be used exclusively for sending messages to and from said offices. About 17 miles of brass tubes three inches in diameter were used.

New Steel Process.

The diamond-making experiments of Moissan have suggested to M. Jules Garnier a new method of producing steel that he expects will revolutionize the steel industry. The process is claimed to have been satisfactorily tested. The steel is said to be made instantaneously by placing a bar of iron and a stick of charcoal together in an electrical firebrick furnace and subjecting them to a strong current.

A Tall Chimney.

The Brooklyn City Railroad Company has just completed at its plant a smokestack 293 feet high, 38 feet and 3 inches at the base, tapering toward the top and surmounted by a five-ton iron cap. The inner core or chimney proper contains 63,800 cubic feet of air space. The chimney will take the smoke and gases of 36 500-horse boilers using forced draught.

This stack is one of the largest in the country. It rests upon a foundation of 14 feet of stone and 9 feet of concrete supported by 1201 piles. Some 2,000,000 bricks are used in the work of construction.

New Fire Alarm.

A novel fire alarm has lately been produced in France. It consists of hollow sphere of aluminum supported at one end of an arm, with a counterpolse at the other end, the two being arranged to balance at the ordinary temperature and pressure of the air. The apparatus is not sensitive enough to record natural changes of pressure, etc., but if some unusual cause, such as fire, or even a large accumulation of coal gas in the atmosphere, disturbs the specific gravity of the air, the ball drops and rings an electric alarm in falling.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.
Daily and Weekly edition. Olves all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.

$1000 WORTH OF LAW
FOR $1.50.

"How to Be Your Own Lawyer" is the title of a book of over 600 pages, adapted for use in every State and Territory in the Union, and is by far the best and most complete work of the kind ever published. It gives instruction on all the most important law points which a Farmer, Mechanic, Merchant or anybody else would want to know about, and if carefully studied and kept at hand for consultation when needed will save any man, in the course of an ordinary business career, hundreds, if not thousands of dollars. It is a lawyer whose retaining fee (the price of the book, $1.50) has to be paid but once in a lifetime. Plain and concise directions are given and forms furnished for the transaction of all kinds of business, and the preparation of every description of legal document in common use. A copy of this valuable work, handsomely bound in extra cloth, with ink side-stamp, will be mailed to any address on receipt of $1.50.

The Explorers' and Assayers' Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Electricity.

The Trolley for Canals.

The attempt to use electricity for propelling canal boats near Rochester was a distinct success; but technical journals regard it rather as a popular exhibition than such a scientific test as would determine all the questions involved in this great enterprise. These, in view of the importance of moving great quantities of bulky freight cheaply, are now receiving careful consideration from competent persons.

The *Electrical Engineer*, for instance, calls attention to the extra resistance offered by shallow water to the passage of boats, and the increase in the reqnired power, in a geometrical ratio, for every increase attained in speed. Hence that paper urges that the canals of New York State be deepened to nine feet without delay.

In the *Engineering News* it is suggested that a flexible cord or cable should be substituted for a stiff pole, to bring the current down from the trolley wheel, to the motor in the boat. This would make it easier to maintain connection with the supply wire when the boat drifts sideways. The belief is expressed, moreover, that two wires may prove unnecessary, and that the return current can he handled by sending it into the water through a suitable "ground" plate in the bottom of the boat. Still another idea brought forward by the *Engineering News* is that the motor might be so constructed as to ride on the overhead wire (or cable), and to take hold thereof so as to tow the boat. This would involve more expensive overhead construction, but it would render a screw propeller unnecessary; and, although the latter device is already made to work fairly well by steam-power on craft of this character, there are objections to it that have not been overcome. If a screw must be used, though, a large one, moving slowly, or twin screws, which could be smaller and more easily submerged, are considered desirable. The extra cost incident to the employment of special tugs, instead of motors on each boat, is deprecated by experts.

Another point needing consideration and experiment is the feasibility of "turnonts" for boats meeting and passing each other, adds the New York *Tribune*. On street railways it is easy to have the cars meet at specified points, but whether boats can he rnn on a schedule or not is quite a different question. Whether one, two or four overhead wires are necessary is yet undecided.

Damage by Lightning.

Writing to *Industries*, Mr. A. A. Voysey gives an account of an apparently unusual cause of damage by lightning. In a room in a country honse near Nottingham stood a table "ornamented by a fringe fastened securely to it hy nails. This fringe had been almost entirely burnt on the side of the tahle facing the room, and the burning had partially extended to one other side. The wood was charred to a depth of one-eighth to one-quarter of an inch where the fringe was hurnt. If the table had heen struck hy lightning, there must have heen some marks in the room showing where the discharge had entered and where it passed to the earth. But not a mark or sign of any kind could he found, and the damage to the tahle was completely isolated. A rigid inquiry proved that no one had entered the room with a candle. The only possible explanation of the occurrence was suggested hy an examination of the fringe. It was found to consist of a fluffy material, probahly a mixture of cotton and wool, and certainly of an inflammable nature. Interspersed among the fluffy material were fine metallic threads. Now, it is in this combination of inflammahle material with the metal threads that the explanation lies. The metal threads were acted on inductively by the lightning discharges taking place near the house. This inductive action was sufficient to cause small sparks to fly between various threads, and the sparks set the inflammable material on fire. If the fire caused in thls peculiar manner had not quickly died out, the whole house might have heen destroyed, and no sign would have been left to point to the true cause. It is not unusual for fires to occur in connection with thunderstorms, and they are generally attrihuted to the direct action of a lightnlog discharge. Possibly a large percentage of such fires have been caused by induction, and the simple incident which has come to my notice is sufficient to show how easily the inductive action may cause a fire."

A Monster Engine.

The Dickson Manufacturing Company of Scranton, Pa., has just completed a monster engine for the Edison Illuminating Company of New York city. The engine weighs 400,000 pounds and is of 2500-horse power. It required ahout one year to put this great piece of mechanism together, and now employes of the company are taking it apart, marking each portion so that the machinists who set the engine up in the plant of the Edison Company in New York will know just where each piece helongs, and packiog in boxes the smaller parts of the engine. It is thought that the eogine will be ready for shipment very soon.

The engine is what is known as a quadruple-expansion engine of the Van Vleck pattern. It has two crank tandem cylinders, one of high pressure and one of low pressure. The dimensions of these cylinders are 26x37, 52 and 72x36. The engine will be capable of making 90 revolutions a minute. The gearing is what is known as Joy valve gearing, with piston valves controlled by hydraulic governors. The crank shaft is a steel forging and weighs, of itself, 30,000 pounds. Armatures are to be placed on each end of this shaft when the engine is placed in position in the electric-light works.

Rail Heating Device.

A novel method of removing snow and ice from electric railway rails, or of preventing its formation, has recently been patented by Charles S. Smith and E. E. Knowles of Spokane, Wash. It consists of electrically heating the track rails by a device adapted to be placed in the body of the rail in such a manner that the heat produced by the passage of the current will be conducted to the tread of the rail to melt any ice or snow which may be there.

The heater consists of a rod of porcelain, or some other insulating material, provided with a helical groove in which is wound with a conductor one terminal of which is connected with the line and the other with the rail or earth. This rod heater is accommodated in a circular hole in the head of the rail and running longitudinally for its entire length, or in a special heating plate adapted to be secured to the rail. The exact position of the opening is, of course, immaterial so long as the heat supplied is transmitted to the tread of the rail, though the nearer the opening is to the tread the more efficient will be the device.

Massage and Electricity.

A singular attribute of massage is noticed by Dr. A. Symons Eccles, who has discovered that it indisputahly decreases, in a marked degree, the resistance of the skin to the passage of electrical currents, says the *Electrical Review*. In this way the number of cells necessary in order to pass a given quantity through the skin, in cataphoric and other treatment, can be reduced and a great economy of electricity effected. Dr. Eccles suggests that where the alternating constant current is used for the purpose of percntaneous medication by satnrating the electrodes with a watery solntion of the substance selected for use, the effectiveness of the applicatlon will he materially increased hy preliminary massage; the drug will he more rapidly absorbed just as surely as the resistance of the tissues to the passage of the electric current will be reduced. The science of cataphoresis, or the driving into the tissues by the application of electric currents of drugs or medicines, by which many injured parts can be treated that otherwise could not be reached, is now largely brought into requisition, both in hospital and private medical practice, and. Dr. Eccles' discovery is likely to greatly increase its efficiency.

Useful Information.

How to Live a Century.

First, live as much as possible out of doors, never letting a day pass without spending at least three or four honrs in the open air, says *Medical Age*.

Second, keep all the powers of mind and body occupied in congenial work. The muscles should be developed and the mind kept active.

Third, avoid excesses of all kinds, whether of food, drink, or of whatever nature they may be. Be moderate in all things.

Fourth, never despair. Be cheerful at all times. Never give way to anger. Never let the trials of one day pass over to the next.

The period from 50 to 75 should not be passed in idleness or abandonment of all work. Here is where a great many men fall. They resign all care of interest in worldly affairs, and rest of body and mind begins. They throw up their business and retire to private life, which in too many cases proves to be a suicidal policy.

During the next period—the period from 75 to 100 years, while the powers of life are at their lowest ebh—one cannot he too careful about catching cold. Bronchitis is a most prolific cause of death in the aged. During this last period rest should be in abundance.

Anybody who can follow these directions ought to live to be 100 years old at least. There is always this comfort, however—if we cannot live up to our ideas always, we can at least try our best to do so, and the steady effort will be brioging us constantly nearer them.

Death Rate of Large Cities.

Statistics are given below compiled for the first half of this year by Secretary Carter, of the Maryland Board of Health, showing the mortality in various cities of this country and Europe having a population of more than 100,000:

	Population.	Deaths.	Death rate per 1000.
London	5,849,104	55,895	19.11
Paris	2,424,705	28,675	23.61
New York	1,801,739	23,855	26.47
Berlin	1,869,124	17,181	20.58
Chicago	1,458,000	13,590	18.95
Vienna	1,435,931	18,005	25.07
Philadelphia	1,116,562	12,249	21.95
Brooklyn	978,394	10,685	21.84
St. Louis	520,000	4,802	18.47
Brussels	488,188	4,359	17.86
Boston	457,397	5,816	23.88
Baltimore	455,427	4,806	21.10
Dublin	349,594	4,736	27.05
San Francisco	330,000	3,006	18.21
Cincinnati	305,000	3,000	19.67
Cleveland	290,000	2,688	18.19
Buffalo	290,000	2,361	16.28
Pittsburg	255,000	2,923	22.92

Louisville	227,000	1,630	14.30
Minneapolis	209,000	1,004	9.60
St. Paul	156,000	746	9.61
Christiania, Norway	166,500	1,385	17.75
Denver, Colo	150,009	871	11.61
Rochester, N. Y	144,884	1,291	17.87
Reims, France	105,408	15,03	28.62

The Human Family.

The human family living on earth to-day consists of about 1,450,000,000 persons in round numbers. Of these only ahout 500,000,000, or one-third, are even properly clothed; 250,000,000 habitually go naked; 700,000,000 have only the middle part of their hodies covered; only 500,000,000 live in houses, 700,000,000 in huts or caves, while the remainiog 250,000,000 have no home or sheiter whatever.

World's Fair Passenger Business.

Under the caption, "How They Got Here," the Chicago *Inter Ocean* prints the following as the amount of passengers carried to the city by the various roads:

Chicago, Burlington & Quincy	2,300,000
Chicago & Alton	250,000
Northwestern	2,700,000
St. Paul	622,000
Michigan Central	350,000
Chicago & Grand Trunk	367,903
Santa Fe	88,618
Baltimore & Ohio	581,500
Illinois Central	250,000
Fort Wayne	542,000
Pan Handle	186,100
Wisconsin Central	53.174
Chicago & Erie	295,000
Rock Island	600,000
Wabash	200,000
Great Western	50,000
Monon	100,000

South Side Elevated	22,248,779
World's Fair steamships	3,000,000
Total	215,750,173

How Coke Is Made.

The process of producing coke is thus described: Ovens in the shape of beehives are huilt with an opening in the top and a small door in front. After the fires have once heen started in the ovens, the hricks retain sufficient heat to ignite each subsequent charge of coal. The coal goes in through the opening at the top, the door below is sealed with firebrick and clay, and in a very short time the coal becomes heated to a liquid mass. It remains in this state two or three days. All this time a fierce flame is pouring out of the opening through which the coal entered, hut it is only the gases and other volatile matter that are passiog away, as the flame prevents the introduction of air, and the carbon—the greater suhstance of the coal—will not burn without oxygen. Thus in time all noxious gases, such as phosphorous and sulphur, which would enter into and injure the product of the ores in smelting, are lost, and only the carbon is left. About a third of the coal is consumed in this process. When it is time to draw the oven, the bnrning coal is drenched with water, and as it cools, it cakes and cracks from the contraction of the cold. It is then drawn, and is ready for use.

New Way to Fell Trees

Trees are felled by electricity in the great forests of Galicia. For cutting comparatively soft woods, the tool is the form of an auger, which is mounted on a carriage, and is moved to and fro and revolved at the same time by a small electric motor. As the cut deepens, wedges are inserted to prevent the rift from closing, and when the tree is nearly cut through, an ax or hand-saw is used to finish the work. In this way trees are felled very rapidly and with very little labor.

Comfort and Decoration.

The fact is, decoration may be good, hut comfort is always the most precious element of home life, says the New York *Recorder*. Some of the effort expended in hand-painting hroom handles would go a long way, if properly directed, toward giving people a thimbleful of hlack coffee in bed in the morning.

A jug of hot water, as a matter of course, without effort, every morning—what a neces-

sity to comfort that is, and how many families have plush hanners till they can't rest, and never see a drop of hot water outside the general hathroom, except they make violent and nnseemingly excursions after it at strange honrs and in weird costumes.

The proper receptacle for it, hy the way, is not a jug at all, hut a tin can with a spout, a handle and a cover.

Why not, if you love to do things for your honse, have as many of these cans made as there are hedrooms in your house? Have it done on the pattern of the cans that come with tin foot-haths, only ahout half the size. Have them painted to match your rooms, if you love a dainty finish to your arrangements.

All the worked mottoes and scripture texts you can hang on the walls are not so conducive to sweet piety on a hot night as a pitcher of ice water.

Every one can get and always does get it in a hotel—how sad to so often languish for it in a guest chamher! And how little comfort, while one languishes, is the cross-stitch pnrple needlework dog with head eyes on your footstool.

Guest chamher and torture chamher are too frequently synonymous terms anyhow.

To run around with a match hurning your fingers hecause there is no place to throw it—who hut a guest experiences that particular form of painful lunacy?

For, of course, he could hiow the match out, hut he's so confused hy the absence of an accustomed receptahle for it that he loses his head and a portion of his cuticle, and finally puts it in the slop jar, whence it gets into a drain pipe and hrings woe to everyhody hut the plumher.

These hints indicate a field for household decorations lying all too fallow.

A little decoration of daily life with ease-hegetting arrangements is more needed than all the rihhons that ever tied up kindling wood or floated from enameled wooden spoons.

Tobacco Displacing Cotton.

The president of the National Cigar Leaf Growers' Association (at Lake City, Florida) expresses the opinion that tohacco culture is the coming industry of South Georgia and Florida. In his opinion there will he 5000 farms in the localities indicated planted in tohacco next year that are now planted in cotton. They are growing fine grades of cigar tohacco, equal or similar to the Havana article, in the sandy lands of South Georgia and the hordering counties in Florida, and the profits have proven attractive so far, causing wide-spread interest and a rapid extension of the acreage. With more experience and care in curing the crop and its more general cnlture in the district referred to, the competition among the tohacco huyers resulting will make the returns to the growers very profitahle. Prominent citizens of Lexington, Kentucky, are among the large investors in tohacco planting ahout Chipley, Florida.

Alnminnm Paint.

A recent issue of the *Revue de Chime Industrielle* contains an article on aluminum paints. Aluminum, when reduced to powder, and mixed with a solution in water of gum-lac, gives a metallic paint which covers well, and may he shaded with aniline colors dissolved in water. The solution of gum-lac is made hy hringing to hoiling polnt a mixture of gum-lac and horax and an alkall such as soda or ammoniac. The solntion must contain at least from 15 to 20 per cent of gum-lac. Aniline colors are added to produce the shade desired, and aluminum is added in sufficient quantity to produce a paint sufficiently fluid for application with a hrush. The color is hrilliant, very durahle and impermeahle, and may he applied to metals, paper, wood and woven materials. It may he rendered supple hy the additlon of a small quantity of glycerine.

Books on Working Ores.
By GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition an the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.
This rare book on the treatment of gold and silver ore without quicksilver is berally illustrated and crammed fullof facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Itis a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco
By C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. I will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—PRICE $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion; Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

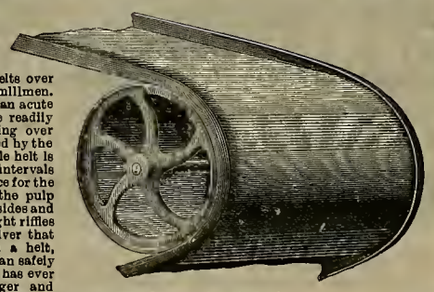
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

FRANCIS SMITH & CO.,

MANUFACTURER OF

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

NO. 130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x86 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Coast Industrial Notes.

—The Montana National Bank at Helena has reopened.

—An electric railway is to be built between Pomona and Claremont.

—Richard Gird, the Chino capitalist, is about to build a fine brick school-house for Chino.

—Government surveyors are surveying public lands between San Bernardino base line and the Mojave desert.

—The merchants of San Francisco have subscribed $73,000 of a $100,000 guaranty fund for the North American Navigation Co. The remainder will be raised.

—There is an immense deposit of beautiful gray sandstone about ten miles southwest of Kingman, near the line of the Atlantic & Pacific Railroad that will some day be used for building purposes.

—The Washington (State) capitol Building Commission has received plans for the building to the number of 173. The Commission has concluded to place the plans in convenient form for examination.

—Healdsburg and Petaluma capitalists are agitating the question of connecting the two places by means of a wide, shallow canal, which will float lighters. It is designed by this means to get cheaper transportation for freight.

—"Wheat driers" are being erected at Oakesdale, Wash., where the cereal damaged by rain and floods can be restored to a commercial condition. It is claimed that damaged grain thus treated can be converted into No. 1 shipping wheat.

—The receivers of the Northern Pacific Railroad have taken steps to secure terminals for that road at Seattle. They have an option on the property of the Seattle Transfer Company, and notice of the purchase was recently served on that company.

—A company has been organized in Washington State to compete with the present telephone company. They will use the new system, which does away with the central office, as each subscriber can make his own switches. The price for the rental of boxes will be $2 50 per month.

—James L. Flood denies that either he or Mr. Mackay proposes to spend any money in developing coal beds in Mendocino county. It is understood that Mr. Flood's objection to working the mines owned by himself and Mr. Mackay is that the nearest points from which shipments could be made, Ukiah, is 60 miles away.

—Articles of incorporation have been filed by the Oakland Water Company. It purposes furnishing Alameda county with water. The capital stock is $3 000,000; of this $32-000 has been subscribed. The directors for the first year are: Alvinza Hayward, A. W. Rose, Jr., William J. Dingee, H. G. Stevenson and W. E. Snell.

—The next steamer that sails for Honolulu will have in her cargo a steam-plow plant, which is expected to revolutionize the present method of cultivating the great sugar plantations on the islands. The plant is for the plantation of R. Wilcox, on the island of Oahu, and consists of boiler and engine, cables, etc., and a 12-plow machine capable of plowing 50 acres a day. The machinery is in charge of George Carter, an expert machinist from Leeds, England, who will put the plant in working order on Mr. Wilcox's plantation. The steam plows will take the place of the horses now used to perform the same work, and are expected to go far toward cheapening the cost of production.

—The bankrupt Oregon Pacific road was bought last week, under the hammer, for $200,000 by representatives of the Blair faction of stockholders. The employes and other creditors of the Oregon Pacific have sent protests to Judge Fullerton asking him not to confirm the sale. They have legitimate claims against the property for about $350,000, and when the expenses of the courts, receiver and advertising, which lawyers claim must be paid first, are taken out of the price for which the property was sold, the laborers fear that they will receive but a small percentage of their claims. It is claimed that at the lowest reasonable estimate the property is worth $500,000. It is thought that Judge Fullerton will refuse to confirm the sale.

—The New City Hall Commissioners have adopted Architect Shea's plans and specifications for the completion of the great central rotunda, which will cost about $340,000 and give employment to several hundred skilled workmen and laborers for fully a year. Owing to the complexity and magnitude of the work, the secretary of the commission has been instructed to formulate advertisements calling for bids upon a part or whole of the work. Preference is to be given to materials of domestic manufacture. The commissioners will hold a special meeting in order to pass upon the terms of the invitations for proposals, and the steel, iron, terra-cotta, copper and other dealers in tower material will have a chance to inspect the specifications and submit figures for furnishing the crowning piece to the great gray hall.

—The big Coos Bay cigar-shaped raft went to sea Saturday afternoon without a hitch in any way. Captain Magee was placed in charge of the raft about ten days ago. He immediately went to San Francisco and procured the steamer National City for a tow boat. He took on 250 tons of coal from Newport, made a few necessary repairs to the raft, and with her in tow at flood tide took her safely out. This starts a new industry at Coos Bay, as this county abounds in piles and other kinds of timber that can be taken to San Francisco quickly and cheaply. There has been a good depth of water on the bar all winter, and the National City found 22 feet when she crossed. The raft contains 3315 piles of an average length of 70 feet. The raft is 620 feet long. It is thought it will reach San Francisco in a week if the weather is favorable.

—The joint irrigation dam of the Modesto and Turlock irrigation districts, across the Tuolumne river, near La Grange, was completed Dec. 13th after two and one-half years' work. It is claimed to be the highest overflow dam in the world, being 127 feet high. At the base it is 117 feet thick, and at the top 15 feet. It is in the shape of an arch, and is 236 feet across at the top. The cost was about $550,000. It contains 38,700 cubic yards of masonry, and 31,000 barrels of cement were used. The dam will supply water to 276,000 acres of fertile, level land in the two irrigation districts in Stanislaus county. The canals upon both sides have been partially finished, the total work so far costing $1,800,000. The dam is also intended to furnish power by electricity for manufacturing purposes. Two million dollars in bonds have been voted for the enterprise.

—The continuation of the cable line from the present terminus of the Sacramento-street line, in this city, is nearing completion. This is to run from the intersection of Sacramento and Walnut streets to Lake street, thence to Sixth avenue, and along Sixth avenue to D street, a distance of about four miles. This leads directly to the Midwinter Fair grounds. Manager Stein thinks this is the quickest job of cable-road building ever attempted in this city, the time occupied in the operations being only about six weeks. An army of men is still at work, 60 scrapers with four horses each being engaged in one fill. It is expected that the road will be open for business soon after the first of the year. The cause of haste in putting in the road was that the company's franchise was about to expire, and it became necessary for them to have the line completed by Christmas, which they say will be practically accomplished, though no passengers will be carried until a fortnight later.

—In the near future the Southern Pacific Company will make an important extension of its coast division line. One branch of this division at present terminates at Tres Pinos, in San Benito county. The proposed extension will carry the road south through the mountains and several large fertile valleys to a point opposite Alcalde, Fresno county, and thence east into Alcalde, where it will be joined to the Goshen branch of the Southern Pacific. Another short road will be run easterly through the hills from Kings City, thus uniting the Paso Robles branch with the proposed road. One of the most beautiful sections in southern California will be tapped and have an outlet to the east over the Goshen route and two outlets to San Francisco by the way of Hollister and by Kings City. The survey has already been made, and it will not require an immense amount of work to complete the construction of the proposed branch. The opening of this road will be of great importance to the building trades in this section.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

The importance of this powerful agent—public opinion—for the prevention of injurious acts is too obvious to need to be illustrated. If sufficiently at command it would almost supersede the use of other means.—James Mill.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

A NEW FOREMAN.—Amador *Ledger*, Dec. 15: At the Gover mine, S. H. Hoskins has resigned his position as foreman, and has been succeeded by Wales Palmer, who has been duly installed to fill the responsible position. Wales is a Native Son, and has been identified with mines and mining ever since he was 12 years of age. He is the oldest son of John Palmer, the pioneer mining man who has been superintendent of several mines in this State and the Treadwell mine in Alaska. The shaft at the Gover is now down nearly 1400 feet, the vertical depth of the lower level being 1000 feet. The last clean-up proved the best during the history of the mine, all the rock crushed being taken from the lower levels which are being fully developed at present, and which proves as in all paying mines in Amador county that from the lower levels comes the sought-for metal. A new electric pump capable of throwing 20 miners' inches of water is expected to arrive in about three weeks, which will be placed at the 700 level, and the one now at that station will be put at the 1000 dam. As soon as they are in good running order, they intend to run the shaft 200 feet deeper. Between 50 and 60 names are on the pay-roll at present. The timbers are already framed for the sawmill and the timber framer. Enough timbers, poles, lumber, wood, etc., are now on hand to last until late in the next summer, and all the contracts have been filled.

M. A. Hurley, president of the Horley Gold Mining Company, which owns and works the Lone Star mine near West Point, came up from the city on Monday in company with A. V. Oliver and Mr. Webster. Mr. Oliver is going to take charge of the Lone Star mine as superintendent. Mr. Webster, the present foreman of the mine, is soon going to leave, and the vacancy will be filled by Wm. Watt.

M. Hultaddo and J. Bales, who have been mining near Middle Bar, took out on Thursday 100 pounds of black metal which is spiked with gold. The quantity of the metal in the pocket which they struck is unknown.

J. B. Francis, superintendent of the Alma, who has been in San Francisco for several weeks on business connected with that property, returned to Jackson a few days ago.

The middle bar shaft of the Albany property has been thoroughly cleaned out, and sinking will now be continued.

Everything seems to be quiet at the La Jolla at Drytown.

LEASED THE SPANISH.—Enterprise Cor. *Record*: Messrs. Miller and Aden have leased the old Spanish mine on the Ballard & Martin tract, and are taking out some fine ore, which they intend to have crushed in Mr. Heald's mill at Nashville. This mine was worked in early days by Mexicans, who used the primitive style of the arrastra, and reports are that some of the ore was of fabulous richness. In prospecting in this old mine, Mr. Aden thinks he has struck the original chute of ore that the Mexicans were working, and, from what I can learn, the ore they are taking out is of very high grade, and the boys are confident they have a small bonanza in sight.

Mr. Holbrook, a San Francisco broker, was here yesterday looking over the locations on the mother lode, but more particularly the Montezuma mine, which is situated on the great foothill lead of the mother lode, north of the Havilla mine.

Everything is working satisfactorily at the Bay State mine. Their concrete bulkhead is keeping the water back from the shaft in good shape, and the sinking will be comparatively dry. The surface water coming down the shaft is caught in a temporary dam on the station and raised from there in tubs. Superintendent Jones and his foreman have accomplished a difficult job, and they may well feel proud of their success when it is taken into consideration that there is a pressure of 110 pounds to the square inch to work against.

Calaveras.

A HYDRAULIC MINE.—*Chronicle*, Dec. 16: The work of fitting up the North Star mine for hydraulicking purposes is progressing rapidly. A two-foot flume 28000 feet in length has been put in, 700 feet of 11-inch pipe laid, and a fine building 16x30 erected. The water will be taken from the Mokelumne & Campo Seco canal, under a 200-foot pressure, and the supply used will be about 400 inches per day. The work is being done under the supervision of Mr. C. M. Burleson of this place, a practical miner and an experienced man in this kind of work.

THE SANCHO.—*Chronicle*: Some samples of rock from the Sancho mine are very rich. This mine, which is owned by John Sancho and James Garavanti, is situated in the Gwin mine district, about 1½ miles from the Mokelumne river. A tunnel has been run in a distance of 80 feet on the ledge, which taps the vein at about 100 feet from the surface. The vein at this point is 12 feet wide, and the rock taken from it assayed $4.50 in free gold, while the sulphurets went as high as $70 per ton. The vein is undoubtedly the mother lode, as the rock is of the same character as that found in the famous Utica mine at Angels and the Kennedy mine in Amador county.

Kern.

NEW FIELDS.—Los Angeles *Herald*, Dec. 19: The recent gold discoveries in the Goler and Red Rock districts northeast of Mojave, have caused great excitement throughout southern California, and the emigration to those places is so large that it looks as if a big town would be developed in short order.

This morning a *Herald* reporter feasted his eyes upon a $1000 worth of gold nuggets which had been brought from the new "diggings" in the Goler and Red Rock districts, 28 or 30 miles north of Mojave. If the present indications hold out according to expectations, that region will soon become a second El Dorado. It is now assuming the character of an old-time California mining camp. The new "finds" are now paying from $6 to $20 per man, while many of the older claims are panning out many times that amount. As is the case in all new mining camps, claims are becoming scarce but prospecting more plentiful.

Considerable excitement marked the discovery of gold in the Goler region eight or nine months ago, and many people flocked to the new camp. A party of San Bernardino prospectors stole a march on many of the gold-seekers. To avoid giving out the object of their mission, the party passed through Mojave at night, and began work at the mines before it became generally known that gold existed in large quantities. The Goler mines have been almost continually worked since last August with good results. Over $25,000 has been taken from the diggings at Goler.

W. C. Wilson of Mojave has bought and sold over $6000 worth of nuggets from that district. The rest has been shipped direct to the mint at San Francisco.

One of the best paying mines at Goler is the Bald Eagle, No 1, owned by Gus. Hagg and A. Johnson of San Bernardino. A shaft 35 feet in depth has been sunk, and over $2000 worth of coarse gold and nuggets has been taken out. The "drift" is excellent. Another shaft is being sunk. Mr. Johnson declined to say what was being taken out each day, but it was evident that he and his partner have a bonanza.

The Beeson Bros.' claim is panning out well. It is in shallow diggings from six to ten feet. A nugget from this claim in the the possession of W. C. Wilson at Mojave weighs $280, another $145 and another $66.50. The larger one was picked up in Nugget Gulch.

Charles Sherman, a newspaper man who went into the camp Sunday, purchased a large nugget for $147. From the looks of things such finds are of frequent occurrence.

Three bottles of fine gold and nuggets were exhibited by Mr. Wilson. The yellow stuff came from Goler and amounted to over $400. Besides the claims mentioned numerous others are being worked successfully. A large number of certificates from the San Francisco Mint show the gold to pay $17.77 net per ounce, which is considered big money.

The Red Rock district is turning out considerable gold. A miner who has been working the district since it was opened six weeks ago claims that no less than an ounce of gold is taken out by each man. Three men took out 15 ounces or nearly $300 in one day, but this was the luckiest day encountered. The gold here is coarse, some of the nuggets weighing as high as $8 and $10. These valuable chunks of gold are growing scarcer as the days wear on, but pay dirt is found all the time. Dry washers are largely used in taking the gold out.

Red Rock is a very flourishing camp and is on the road to Globe and the Summit district.

The Sommit claims were located only four or five days ago and are situated on the elevation dividing the Mojave country from the region opening into Death valley. The south end of the famous Valley of Death can be seen from the last discovered diggings called Summit.

The new find was located by Mr. Van Slack and three other prospectors from San Bernardino. The locators sold a claim to sink a shaft to bedrock. The prospects are decidedly flattering, as pay dirt was found at the outset. Summit is 65 miles from Mojave and about 30 miles from Red Rock.

While at the camp on Sunday, three boys drove from another location and exhibited some rich dirt but refused to give the location. In fact, the whole country is being prospected and more or less gold found.

Will Robinson, an experienced coast miner, is of the opinion that the value of the Goler and Red Rock districts is limited, while he expresses great confidence in the newly-discovered region where his claim is located. This diversity of opinion is only typical of the real miner and cannot be of great value to the prospector in times of mining excitement.

A San Jose prospecting party is now engaged in the old deserted El Paso district in trying to develop water. It is thought that good water can be secured. Lack of water is a drawback to the new Summit diggings. The gold found in these parts is very fine, unlike that taken from Goler and Red Rock. Several washes at Summit appeared to be very extensive.

A San Bernardino prospector claims that he has discovered auriferous rock in paying quantities in Mesquite canyon, seven miles from Kane Springs, on the road to Goler and beyond Red Rock. The quartz lead is of recent discovery. It is the first ledge to be found that presents bright prospects. Quartz mining has as yet been almost unheard of in these gold fields.

In the Goler district miners, who prefer it, are getting $2.50 a day and board. None but good miners are employed. Meals are 35 cents in this camp and other necessaries in proportion. The prospectors are all supplied with their own outfits, both as to provisions and bedding. The weather up there is cool. Feed for horses, such as grain, is scarce, while the burros do not suffer owing to their peculiar taste for vegetation that the horse cannot touch.

In going to Summit the prospectors secure water from the Mesquite springs, where the water is unusually good. Water can also be secured at the last station on the road to the borax works in Death valley.

The Red Rock district is about 27 miles from Mojave. The road is good the entire distance.

When the forks of the road are reached this eide of Red Rock the prospector going to Goler takes the road leading to the north. The other road leads into Red Rock canyon, where there is a mining camp of no mean dimensions, in fact, all the region is beginning to assume the characteristics of early mining daye, when gold was found easily and spent lavishly. Men and teams are constantly going in and out of ths new gold fields.

Nevada.

THE EVENINO STAR.—*Telegraph*: The Evening Star Mining Company is now engaged in paying their last installmsnt on the purchase price at the Citizens' Bank. It is understood that there will soon be some very active operations started. A new shaft will be sunk and the ledge will bs tapped at a place where a great deal of labor can be saved in the working of the mine. There will be eeveral changes in the huildings, and in fact the whole outfit will he rearranged.

FOR A NEW ROAD.—*Herald*: The people of Washington and vicinity want a road from Washington to the California mine, and with that end in view have raised some $1400 or $1500 by private subscription. The road will be about seven miles long, and will open up God's Country.

AT THE SEBASTOPOL.—*Union*, Dec. 19: A mine that will come to the front soon is the old Sebastopol, eituated on Oshorne Hill, worked by ths Watt Bros. in the early '50s, and which paid very well at that time. Considerable work is being done on the ground in the way of prospecting. The Sebastopol is situated in a good locality, being joined on the eouth by the Green mountain, on the southwest by the Osborne Hill, and on the north by the Orleans. These mines are all working and doing splendidly. In fact, all along the lode, from the old Empire to the Oshorne Hill, considerable work in the way of developing and repairing old mining propsrties is under way.

A STEIKE IN BELLEFONTAINE.—The Bellefontaine Company, at Willow valley, have struck what they believe to he the old Beach shoot, which paid so well in 1858, says the *Herald*. It is thought the rock will go as high as $75 psr ton, and there are 600 feet of backs. It is splendid looking ore, heavily sulphuretted, and free gold may be seen all tbrough it.

BAD BLASTINO ACCIDENT.—*Transcript*, Dec. 14: Two men arrived here from Washington last evening to go to the Eagle Bird mine to attend two men who had been blowu up by a blast. It seems that the night shift working in the upper tunnel has set off four or five blasts just hefore quitting work. One of the blasts failed to go. They notified the two msn on the day shift, Frank Means and Staples. These men drew the charge, and supposing everything was all right, began drilling the hole deepsr, when the explosion occurred. It is thought that a portion of nitro-glycsrin from the giant powder had lsaked out into the hole. Both men were terribly mangled about the face and head. Means had both eyes hlown out, his hands nearly torn off, and was badly hruised about tbe body. Staples' eyes were badly injured, and it is doubtful if he can escape without ths loss of his sight. He was terribly torn abont the hody. How elther escapsd instant death is a miracle. Both the injured men will probably live.

THE MANZANITA.—*Transcript*: The prospects of the Manzanita gravel mine are better now than thsy have heen for some time. In about two weeks we may expect to hear some good news from that quarter.

THE ONIN.—*Transcript*: The work at the Odin is progressing finely. They have some fine gravel now.

RICH LEDOR.—*Telegraph*, Dec. 15: The big formation which extends from the junction of the north and middle Yuba rivers to the south Yuba river at a point near Jones Bar, promises to be another Comstock, with gold in place of silver. It varies iu width from 40 to 100 feet and is composed of talc, porphyry and ochre, and pays its entire length, a distauce of five miles.

Tbe ore can be mined aud milled for 75 cents per tou. The lowest mill test yet made returne $3 per ton and the highest $18, with an average of ahout $10 per ton.

Upon the Boss location, which has beeu bonded by Messrs. Crall, Trood, Deneca and Godfrey of North Sau Juan, for a period of six months, for $8000, to Messrs. H. M. Morris, T. Dilion and T. C. Howell of San Francisco, a five-foot Huntiugton mill has been erected and a thorough test has been made, which is said (exact amount they will uot say) to have yielded $12 per ton.

A number of Sau Francisco capitalists are negotiatiug for the entire ledge. Locations are now held as high as $30,000, and it is quite likely that a number of big eales will soou be recorded. Excitement rune high.

The principal owners are: H. V. Crane and Frank Wright of San Juan, L. P. Schmidt and J. J. Ott of Nevada City, Sheriff Douglass and R. I. Thomas. The entire ledge is takeu.

It was about 12 yeare ago that this ledge was first known to contain gold. In 1881 a Forbes mill was erected and the owuers, who were inexperienced quartz miners, used hut eight square feet of plates with coarse screens. Under these conditions $3.50 per ton was saved; disagreement among the owners resulted and in consequence nothing has heen done toward practical development till the preseut time.

NEW HOISTING WORKS.—*Transcript*: William Veal and W. Mosby, who are workiug the Graut mine at Canada Hill, will shortly begin erecting uew hoisting works. Part of the lumber is on the ground. In the spring a mill will be put up. This mine is owned principally by Colorado parties.

BY THE "ELEVATOR" PROCESE. — *Herald*: Jerry Goodwiu is preparing to work his miue at You Bst by elevator process. He is now digging about a mile of ditch for that purpose, and will operate on a larger ecale wheu everything is iu readiness.

Plumas.

NEW GRAVEL MINE.—Plumas *National Bulletin*, Dec. 14: Messrs. Nevill, Rosi aud others have located a drift gravel mine at the hsad of Red Ravine, uear the headwaters of Nelsou creek. The locations cover 200 acres ou the line of the channel, which runs iuto Bluenose mountain. The company will begin development work next spring. The indications are that they have a fine property. In an adjoining drift and hydraulic mine, Mr. Bevalaqua and two other men are taking out from $6 to $7 per day to the man. The gold seems to exist in a deposit of blue gravel, very much resembling that found some years ago in the Buffington mine on the North Fork. The owners of the new location are confident that it is on the line of an extensive and rich channel.

B. A. Ivanisevich and esociates are running a tunnel into Bluenose mountaiu from east to west and expect to cross a channel running north and south. After driving their tunnel ahead from 300 to 400 feet, they will sink a shaft to the bottom and prospect the channel. If results prove satisfactory, a deeper tunnel will be run into the mountain. Six men are uow employed, working two shifts. When the work of sinking the shaft begins, three shifts of men will be employed.

Wm. Roche, L. Dolly and John Simpson have a very fine vein of quartz at the head of Squirrel creek. Its average width is 30 inches. The croppings prospect very rich. the result of about a dozen assays made in San Francisco and Oakland bsing $57 per ton. With a 500-foot tunnel, the vein can be tapped at a depth of 200 feet. Tbey are now pushing the tunnel ahead and expect to reach the ore body within 70 feet of the present face.

There seems to be grsater confidence in the future of the Plumas Eureka mine. Quite a development is understood to have besn made near the top of the peak and in an entirely new country. The extent of the new find ie not known.

Messrs. White, Smith and R. M. Dunn have a contract for running a tunnel in the Jamison mine, and tbey are making good progress. The hoisting works are equipped with machinery that works to perfection. It is driven by water power—one of the best in the county. Supt. Obeyney, lately on a visit to his old home in Philadelphia, returned last week, and after spending a few days at the mine, departed for Shasta to visit another important property which his company owns.

AT GIBSONVILLE.—Cor. *National Bulletin*, Dec. 11: The recent storms increased the supply of water to such an extent that the mines hereabout commenced operating.

The Schofield boys are busily engaged repairing their tunnel, prsparatory to taking out some good pay gravel.

The Nsvada mine had a few days water and were enabled to make a start for the season.

The rock in the Tabor mine is becoming softer each day. Three shifts are heing worked, and the entirs community is anxiously awaiting and hoping for a "rich strike."

The Thistle shaft continues to employ about the usual number of men.

San Bernardino.

THE GOLBE DISTRICT.—Los Angeles press dispatch, Dec. 15: Most favorable reports continue to come in hsre regarding the richness of the new mining district called Golee, about 25 miles northwest of Mojave. Frank Budd and W. Zimmerman, of Lancaster, returned today from the camp and at once went back after getting supplies. They are greatly elated over the prospect, and rsport great excitement iu that region and many men striking it rich. Mr. Budd says that big sacks of nuggets are common things thereabouts, and positively stated that a numbsr of miners in Red Rock canyon are takiug out $100 a day on an average, all hy dry washers. Tbe custom is to have a glass far at the side of the washer, aud after the cleanup the nuggets are placed in this, making a stirring sight. The gold ie of excellent grade and is sold at the camp to dealers at $18.50 per ounce. A little farther up the main road to Indepeudeuce a new and equally rich camp is drawing a multitude of prospectors. Mr. Budd states tbat G. W. Hamilton of Lancaster, with his partner, has a very rich claim, and are working iu dirt that pays from $1 to $1,25 per pan, although they were not yet down to bedrock. The news has occasioued great iuterest iu the new camp, and an exodus of mining men has already commenced.

GOOD STRIKE.—Vanderbilt *Shaft*, Dec. 15: A ledge that, at eight feet below the surface, shows well defined walls, a solid veiu five feet wide and one that avereges about $30 from one side to the other, in a camp where as yet no prospect has failed, is what the Gold Bar Mining Company can show iu its new find. It is showing up hetter than was expected, and work on it will be pushed.

Shasta.

FOR THE GLADSTONE.—*Democrat*, Dec. 13: Joe Porter of the Gladstone mine, who has been absent in Idaho for about a year, returned home Sunday. While in Idaho he was engaged in tearing down and putting up mining machinery, and shipped the 40-stamp mill to the Gladstone, a portion of which uow lies ou the platform at the depot. Ten of these stamps will be put up on the Gladstone, and ten will be put up iu Siskiyou county ou a mine the Gladstone Company owns there.

NEW CUSTOM MILL.—*Free Press*: E. Markwick, the mechanical engineer, is about to form a company to erect a custom quartz mill ou Clear creek which will he centrally located for Muletown mountain. Water rights and millsites have already been secured, and three miles of ditch to carry water for power. Thirty-five hundred dollars have already been invested in machinery. Mr. Markwick has prepared all the working plans and is uow confident they will be carried out. He says there is more free-gold quartz in that mountain than any other in Shasta county, and the time is near at hand when there will be 500 men at work in Muletowu mountain.

Siskiyou.

TO RESUME.—Ashland *Tidings*: The Siskiyou Coal Co. is preparing to resume operations at its mine near Montague. An engine has been purchased to operate the pumps and lifts, and a considerable quantity of coal will be taken out. The mine is within a mile of the S. P. R. R. track, and, if the coal ie of as good quality as reported and in quantity large enough to pay for mining, the property will be a valuable one. The vein averages about three feet, and the coal is said to be a far more economical fuel in furnace uss than that generally used on this coast. Roadmaster Buckhalter, Dave Horn, J. C. Coyle and others of Hornbrook are among the principal stockholders.

READY TO BEOIN.—Yreka *Journal*, Dec. 20: The Spangler Brothers are almost ready to commence work again in Humbug creek, above the mouth of the stream, where thsy left good paying gravel over a year ago. The hoisting machinery, pumps and other apparatus are all in place, and when work is started up will be continued right along, with prospects of realizing a fine yield of gold dust.

The Greenhorn blue gravel mine, about a mile south of Yrska, still continues to yield its usual average, but is worked short-handed just uow, owing to a numher of men being afflicted with la grippe.

The Summerville hydraulic claims, in the Salmon river section, are now being worked with energy, the water snpply being abundant to keep a full force employed. The ground in ths Summerville section always yields rich returns, and the company, consisting of Geo. Smith, Geo. C. Spooner, Parker Bros., R. H. Campbell and others, expects to take out considerable gold dust during tbe present winter and next spring until midsummer, or as long as the water holds out.

Quite a large number of miners have taken advantage of the amended relief section of the U. S. Statutes, granting temporary suspension of assessment work for 1893.

The mill at the Sbroeder quartz mine on Deadwood mountain is kept constantly in operation day and night, with a large force quarrying out the quartz. There is only about 16 incbes of snow at the mine, which does not interfsre with work on tbe ground surface to any extent of consequence.

Placer.

NEW MILL.—Colfax *Sentinel*: The new ten-stamp mill of the Gold Ring mine at Green valley will be ready for work about January 10th. Cement gravel taken out of the mine is full of gold. About 16 men are at work at present in making preparations.

About eight men are at work opening up the Golden Eagle mine at Shady Run. A new tunnel, lower than the old one, will be run in ordsr to secure more grade for working.

The Polar Star mine at Dutch Flat will begin operations in a few days, as soon as the works are all in order. This mine was once a famous gold producer by the hydraulic process.

Yuba.

THE BLUE GEAVEL MINE.—*Democrat:* Congressman Caminetti and State Debris Commissioner Kidder visited the Blue Gravel mine, of the Excelsior Company, at Smartsville Monday and inspected the impounding dam which they have constructed. The work has been done in accordance with plans furuished by tbs U. S. Commissioners and was inspected by them after completiou, wheu a permit was issued under which the mine is now being operated.

The dam and settling reservoir covers a large area of ground wbich was mined out by hydraulic process years ago, leaving high hanks on either eide, tbe front opening being filled, which forms a large, deep reservoir. The gentlemeu who have visited the works say it effectually restraius the debris and will coutiuue to do so until filled.

NEVADA.

Eureka District.

DIAMOND AND EXCELSIOE.—Eureka *Sentinel*: Last week the anuouncement was made that the Diamond and Excelsior Mining Companies had filed articles of incorporation in Utah, with their principal place of business at Salt Lake City, to operate two groups of mines and claims in this district. The Diamond Company was organized with Richard Mackintosh, R. C. Chambers, C. L. Rohertson, J. E. Dooley and Charlee Read as directors. The officers for the first term are: Richard Mackintosh, president; R. C. Chambers, vice-president, and C. L. Robertsou, secretary. The Excelsior Company was organized with the same gentleman as directors as those named in the Diamond Company, and with Charles Read, president; R. C. Chambers, vice-president, and O. L. Robertsou, eecretary.

The properties of the respective companies cousist of two groups of mines situated on the eastern elope of Prospect mountain and comprise some of the oldest locations in that part of the district. The plans of the companies are not vet fully matured, but we are apprissd of the following facts: The Excelsior mine will remain for the present comparatively inactive, and the Diamond mine will be worked with less thau one-half the force of meu that were employed iu it before silver dropped away down to the lower figures. It is the intention of the company to conduct their operations in the same conservative manner that governed the businese of the owners prior to their iucorporation. Owing to the unfavorable condition of the silver market the mine at present will not be worked for profit, but for development, and ore will be extracted only in such quantities as will substantially pay the running expenses of the company. A fine, new double-acting engine, with reels for flat wire ropes and capacity and equipments to sink to a depth of 1500 feet, was set up in the lower Diamond tunnel several weeks ago. The main shaft is now down 473 feet, and will be continued to a depth of 1000 feet, and levels will be opensd for the purpose of exploring the mine to that dspth for still more extsnsive opsrations and to be prepared for a better market for the product when the time comes. At a depth of 1000 feet the bottom of the shaft will be about 1700 feet below the surface workings and 500 feet deeper than any otber workings in Eureka district.

The yield of the Diamond mine for ths present year, notwithstanding that no ore was extracted during the months of July, August, Ssptember and October, and a part of November, will sggregate not much lees than 7000 tons, with an average gross value of about $30 per tou in gold, silver, lead and iron. The mine nsver looked as well as it does now.

Ferguson District.

MINE RESUMES. — Pioche *Record*, Dec. 7: Operations at the Magnolia are resumed and promise to be permanent. A small force only is now employed and ore is being shipped to the mill at Hiko, ten teams being engaged in the work since Saturday last. About 800 tons of ore are already out, which is expected to average $100 a ton in gold, and on this grade of material milling will be commenced. Seven men are employed about the mill, and it ie expecteu to be running in about ten days. The mill is in excellent condition considering the lsngth of time it has remained unnsed. As soon as milling begine about 15 men will be put on at the mine, and this force is expected to supply ore enough to keep the mill running steadily. The ore is brought down on the Golden, or north side of the gulch, and a grade is constrncted from the divide on tbe Helene road through Golden. The Ferguson brothers and Jerry Manning have ths work in hand.

White Horse District.

PEOMISINO PROSPECTS.—Tbe Jim Blaine location in Wbite Horse district, Washoe county bas been bonded for $12,000. The shaft is down 90 feet and tbe bottom is in high grade gold-bearing qoartz.

In tbe Royal claim ore assaying from $6 to $100 a ton has been developed.

From ths Emma L. claim samples of quartz are shown specked with coarse gold.

A controlling interest has been sold in ths Black Point, another promising location.

Ths Wadsworth *Dispatch* says that a prominsnt mining expert has offered to hond any one of a dozen locations in the district, hut as the owners have pay ore in sight they are not in the market.

OREGON.

TO TRY AOAIN.—Ashland *Tidings*, Dec. 15: Jas. E. Smith & Co. have concluded to build anotber wheel to run their mill hy the current in ths Klamath river. The unexpected rise in the river last month took out their wheel and they thought of putting in an engine, but finally decided to risk another wheel, which they will hnild so that it may hs lifted higher than the one that was lost. L. E. Payne went over to Anderson's Fsrry from Ashland on Wednesday to construct the wheel for them.

The Sborty, a short extension of tbe Hope mining claim, is now owned by Messrs. Alonzo Edwards, E. K. Anderson and Geo. C. Sanford. They are preparing to work the mine, and have men at work clearing out the old shafts and putting them in safe working condition.

At Cottage Grove, the other day, Dr. Hamsll, secretary of ths Annie Mining Company, said, as the road to Bohemia was impassabls during the winter ssason, the company had placed provisions and 20 good men at the miue for au all winter's run, and, as soon as they could get out in the spring, wonld have a large influx of hullion; also that there would be two uew mills placed in that district as soou as packers could get in.

RECEIVER FOE A MINE.—Jacksonville *Times*: T. J. Obapman of Gold Hill has takeu charge of the Hammersly mine, having been appointed receiver by the circuit court. A large quantity of quartz has been crushed by the small mill on the ground, and it is supposed that it paid well. It is likely that operations will he coutiuued.

The T. P. M. & M. Co. of Leland have five men at work ou their property laying pipe, digging ditches and getting ready to commence active operations at an early day. The water used to operate this mine will be forced by pump pressure to an elevation of 400 feet. Dan Greer, an experienced California miner, is superintendent.

RESUMED OPEEATIONS. — The Taylor Placer Mining and Milling Company of Chicago, says the Grant'e Pass *Observer*, has again resumed operations. Representatives of the company from Cbicago have beeu in the county for a few weeks fixing up its business, which had got into bad shape owing to bad manegement. They have paid off several thousand dollars of its obligations, and now, with a clear record to commence anew with, the work will be pushed to completion. Undoubtedly this company owne some of the richeet placers fouud in southern Oregon. Much of the ground ehows very rich, as high as 50 cents to the pan having heen washed out by prospectors, while it is eaid to he impossible to wash a pan without getting several particles of gold. The company have ou the ground a complete set of powerfol pumps, shipped from the East for the purpose of raising water onto their claim. The pumps will be run by steam power aud are being placed in positiou uow.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 21, 1893.

The course of the silver market during the week has shown little change. There has, however, been a slight advance both in London and New York. The situation with reference to Congressional legislation seems to be slightly better. Senator Voorhees has introduced his silver bill, which, though unsatisfactory both to silver and anti-silver men, seems to give indication that an effort will be made to enact some sort of legislation.

Copper.

James Lewis & Sons' (Liverpool) monthly report says:

A much more hopeful view as to the future value of copper now prevails. It is thought that as the excessive American export of 30,000 tons during the past four months has been so readily absorbed by European consumers and dealers, as soon as the supplies from thence materially fall off, which they will probably shortly do, in view of the great improvement in the home trade of the U. S., further European consumptive demand will considerably diminish the very moderate public stocks held in England and France. Several parcels of matte and cake copper have been repurchased by the original American sellers.

Lead.

The lead market is suffering from great depression in view of the probable reduction of the duty. One week ago the price was down to $3.10 per hundred. It has since then slightly advanced.

Silver and the Metals.

NEW YORK, Dec. 21.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.	Copper.	Lead.	Tin.

Mining Share Market.

SAN FRANCISCO, Dec. 21, 1893.

The Comstock market has been uneven during the week just passed, but has, on the whole, suffered a decline. The trend during last week was wholly downward. At times there were small rallies in certain stocks, but the buyers of one day would become sellers the next day, and there was no stability in the situation, so far as sustaining influences were concerned. Friday afternoon the leading stocks closed at a sharp little advance, but Saturday morning they went down just as sharply.

The market opened at a sharp decline in the Pacific Board-room Monday morning; went still lower at the first session of the San Francisco Board; had a further decline during the subsequent informal session, and closed weak. Business was active among the brokers owing to the increased sales.

Tuesday was the most active morning the mining stock brokers had for over a week. The transactions in Comstock shares were large at all the sessions of the Boards, and the amount of money gained through the commissions was correspondingly great. The market opened at lower prices and continued weak up to the closing. Wednesday there was a reaction, during which many shorts were filled, and purchases were made for account of dealers who thought there was "a turn in 'em." Through such influences the market for a time advanced. Business was also quite lively at the opening. Soon afterward a selling movement began which continued until noon, and prices declined until the leading stocks fell below the lowest points of Tuesday.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DECEMBER 5, 1893.

510,227—BICYCLE—A. Murray, Angel Island, Cal.
510,152—SHAVING BRUSH—G. L. Belcher, Oakland, Cal.
510,317—BRACKET—C. M. Berry, S. F.
510,319—COMPUTING SCALE—Blair & Griffin, Sacramento, Cal.
509,870—NUT LOCK—J. C. Brown, Santa Barbara, Cal.
509,937—TIDE POWER—G. H. Carlson, Hogmom, Wash.
510,250—EASEL—C. E. Fount-in, Port Townsend, Wash.
510,251—SMELTING FURNACE—J. L. Giroux, Jerome, A. T.
510,250—PAVEMENT—W. F. Higgins, Portland, Or.
510,140—GAS ENGINE—G. E. Hoyt, S. F.
509,912—AMALGAMATING SLUICE—J. H. Jory, S. F.
510,143—HARROW—Kelsey, Wallace & Thompson, Lebanon, Or.
510,268—RAILWAY RAIL JOINT—L. W. Kennedy, Oakland, Cal.
509,922—SASH FASTENER—D. C. Livermore, Los Gatos, Cal.
509,925—TIRE PROTECTOR—M. H. Lothrop, Jacinto, Cal.
509,926—FAN FOR ROCKING CHAIRS—J. H. Macartney, S. F.
510,355—BAGGAGE CARRIAGE—F. P. Monn, S. F.
510,079—FUMIGATOR—J. M. Miller, Riverside, Cal.
510,357—HAY KNIFE—A. Moeier, John Day, Or.
510,360—CAR COUPLING—W. C. Nelson, Santa Rosa, Cal.
510,048—ELECTRIC APPARATUS—O. H. Pieper, Santa Rosa, Cal.
510,290—BOOMERANG—C. W. Reneor, Stockton, Cal.
510,200—CAR BRAKE—H. J. Small, Sacramento, Cal.
509,961—TICKET—C. S Smith, Spokane, Wash.
510,055—FRUIT PICKER—Stodder & Eastman, S. F.
510,216—PICTURE BLOCK—C. Walbel, S. F.
510,056—WAGON REACH COUPLING—E. S. Weddle, Traver, Cal.
509,990—FRUIT CLIPPER—F. E. Wood, Pomona, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC SAFETY GUARD FOR CARS.—Ira P. Clarke of Alameda, assignor of one-third to John H. Knstar of Oakland, Cal. No. 510,675. Dated Dec. 12, 1893. The nbject of this guard is to automatically pick up the obstructing body and depnsit it upnn itself, holding it there safely and with as little injury as possible, said guard conforming to all the requirements of travel. The guard consists of a frame or receptacle of a general C shape, suspended from the truck and movable backward by yielding at its upper end, its lower edge forwardly projecting over the rnad hed, and a backwardly yielding flap suspended from ahnve and in front of the upper portion of the main frame or receptacle.

CASH REGISTER AND INDICATOR.—Edward T. Taylor, Oakland, Cal. No. 510,622. Dated Dec. 12, 1893. This invention relates to a register by which the amnunt nf cash received is indicated, and by which the cnnsecutive amounts are added up so that the total may be observed at any time. It consists essentially nf cylinders jnurnaled within an enclnsing casing, having figures arranged spirally around the peripheries, one cylinder showing cents and the other indicating dnllars. Alnng the frnnt nf the machine are indicating buttons or keys having marked upon them figures rspresenting these subdivisinns, which are indicated upon each of the cylinders. These indicating keys are so connected with a pawl and ratchet mechanism that when either of the levers are depressed the ratchet wheel will be turned and with it the corresponding drum. Upon the back of the apparatus is an upwardly projecting portion nf the case having openings alnng the front and back, and within these openings are pivoted plates which carry figures correspnnding with those indicated upon the cylinders and with those marked upon the keys, and which are moved in unison with the keys. The cash drawer, which is situated in the front of the lower part of the register, is stationary, and opened nr closed by means of a rotating shell which surrounds it and which is slotted upon one side.

AIR BRAKE.—Joseph Erdody, San Francisco, Cal., assignor of one-half to John H. Cardoza. No. 510,594. This invention relates to improvements in air-brake mechanism. It consists of a supplemental air reservoir, a brake cylinder having one end in open connection with the reservoir, a pipe supplying air from the main reservoir to the opposite end of the brake cylinder, a piston movable in the cylinder, a valve chamber in the piston and a valve through which air is admitted from the supply pipe to the supplemental reservoir, and means for normally holding the piston at the end of the cylinder adjacent to the reservoir until the pressure in the reservoir is greater than the combined pressure of the spring and the air upon the opposite side of the piston, and pipes and valves whereby the pressure of the air is varied so as to actuate the piston and apply the brake or to relieve the brake by moving the piston in the opposite direction.

TURN-TABLE.—M. A. Edwards, administratrix of E. W. Edwards, San Francisco, Cal. No. 510,592. This invention relates to turn-tables which are specially applicable for use on cable roads. It consists of a mechanism whereby the endless traveling cable which propels the cars may be thrown into contact with a drum fixed upon a shaft carrying a gear-wheel, and through intermediate gearing this gear acts to rotate the table as long as the cable is in contact with its driving pulley. A lever mechanism is so arranged that the cable is thrown into or out of contact with this pulley at the will of the operator, and when a car has been received upon the table, the table may be turned around until it is in position to allow the car to again pass out.

SIGNAL FOR CABLE ROADS.—M. A. Edwards, administratrix of E. W. Edwards, San Francisco, Cal. This invention relates to a signal to be used upon railways. It is especially applicable for use upon railways at the point where the cars arriving upon one track are delivered upon a turn-table having a single track across it upon which the car rests until the table has been turned around, after which the car passes out upon another track parallel to the one by which it entered. The signal is a vertical rotatable shaft carrying targets for day signals and colored lanterns for night signals. An arrangement of levers, cords and pulleys is so stationed that when a car passes in upon the table, it will actuate one of the levers so as to turn the signal and indicate to the next approaching car that the way is not clear. When a car passes out and leaves the table it strikes a corresponding lever upon the other track and again turns the signal into position to show the approaching car that the table is in readiness to receive it.

ENDLESS SELF-LAYING TRACK FOR VEHICLES.—A. P. Anderson, Oriental, Nev. No. 510,668. This inventinn is designed to provide a continuous track for soft or sandy soil upon which vehicles may travel. It consists of a series of track plates of sufficient width and length so that each will form a suitable bearing surface for the wheel when beneath it. These plates have inwardly projecting flanges correspnnding with channels made in the peripheries of the wheels and so tapered as to conform to said periphery. These flanges serve to maintain an endless belt and plates in proper position with relatinn to the wheels of the vehicle. The plates are hinged together or attached to a continuous belt, and have shoes of suitable size and material to form ground bearings, being shod with iron or broad-headed steel nails to prevent wear upon rough ground. The vehicle may be a traction engine and constructed in any suitable or desired way. I employ a jointed frame, one portinn of which supports the engine and the other carries the steering apparatus. In this case, there are three pairs of wheels. The rear or engine wheel is connected with the central axle by a king bolt which allows of movement at this pnint, and the frnnt wheel axle is cnnnected with the front frame of a king bolt, so that the front wheels may be turned to steer the machine by means of a suitable hand wheel upon a vertical pinion shaft, and a curved rack connected with the front axle, with which the pininn engages so as to turn it. As fast as the vehicle passes over a length of the track it is taken up behind the rearmost wheel and carried forward over the front wheels and again placed upon the ground so that the wheels are cnnstantly traveling over it.

REVERBERATORY SMELTING AND REFINING FURNACE—Joseph L. Giroux, Jerome, Arizona. No. 510,251. This invention relates to hnrizontal furnaces of the reverheratory type. It consists in making the furnace in sections which are continuations hnrizontally in line with the fire-box. The latter is made of brick, having the usual grates, a bridge wall over which the heat and flame pass into the first section of the furnace, and another section situated just behind and across the bridge wall which forms a part thereof. These sections are all made of hnllow metal having an outside of boiler iron and the inside of heavy copper plate. The jackets thus formed contain water, which is admitted through a suitable opening into the first section, discharging thence into the next, and so on, in a manner to keep up a constant circulation and prevent undue heating of furnace walls. The furnace tapers or cnnverges toward the end most distant from the fire-place and has an end dnor which is adapted tn he opened at any time for the purpnse of skimming of the slag. Tuyeres open into the furnace at any suitable or desired points to admit an air blast, and these tuyeres cnnnect with wind-boxes which extend along upon each side of the furnace. Openings are made through the outer sides of the wind-boxes in line with the tuyeres to allow metal rods to he introduced to clear the inner end and prevent the tuyeres from being stopped with metal or slag.

PAVEMENT.—W. F. Higgins, Portland, Or. No. 510,259. This invention relates to pavements, and consists in the combination of interlocking prismoidal blocks in conjunction with a concrete supporting foundation and boundary curbs of the roadway and a grating of cement, asphaltum or other suitable material, whereby the blocks are firmly interlocked and are interdependent upon each other for support, thus relieving the foundation of the street from the pressure of any one block independently. As every block is supported in one direction between two others which have diverging bases while in a direction at right angles with these, it, in turn, serves to support the abutting ends of two other blocks which fit against it. This construction leaves spaces between the blncks and also spaces between those at the sides of the curbing, which is filled with the material before described for binding the blocks together. The whole surface may then be coated with asphaltum or any suitable or desired material.

DIVIDEND NOTICE.

San Francisco Savings Union.

326 California Street, Corner Sansome. Branch, 1700 Market Street, Corner Polk.

For the half year ending with the 31st of December, 1893, a dividend has been declared, at the rate of five (5) per cent per annum on Term Deposits, and four and one-sixth (4 1-6) per cent per annum on Ordinary Deposits, free of taxes, payable on and after Tuesday, the 2d of January, 1894.

LOVELL WHITE, Cashier.

Cal. Debris Commission Notices.

THE CALIFORNIA DEBRIS COMMISSION having received petitions to mine, by the hydraulic process, from W. R. Stewart, in the Badger mine near Ono, Shasta Co., and to deposit tailings on adjacent flats; from Olonzo Engle, in the Walker mine, near Igo, Shasta Co., to deposit tailings behind dam in Pomeroy Gulch; from McKinstry & Gilbert, in the Christmas Hill Secon diggings, near Butcher Ranch, Placer Co., to deposit tailings on the banks of a fork of the American river; from W. R. Read, in the Tannery Ravine mine, near Challenge Mills, Yuba Co., to deposit tailings behind dams in Tannery Ravine; from Manuel Mateos, in the Mateos mine, near Sierra City, to deposit tailings in Howard creek; from Jos. Davis, in the Davis mine, near Sierra City, to deposit tailings in Howard creek; from Frank Barbero, in the First Chance mine, near Sierra City, to deposit tailings behind dams in Howard creek; from Philip McGuire, in the North Star mine, near Mokelumne Hill, Calaveras Co., to deposit tailings behind dams in Buckeye Gulch, and from J. W. Smith, in the Green Mountain mine, near Mokelumne Hill, to deposit tailings behind dams in Chile Gulch, and from the 54 Flat Placer Mining Co., in the 54 Flat mine, near Volcano, Amador Co., Cal., to deposit tailings behind dams in a dry ravine—gives notice that a meeting will be held at Room 92, Flood Building, San Francisco, on January 2, 1894, at 1:30 P. M.

Assessment Notices.

STANDARD GOLD AND SILVER MINING COMpany. Location of principal place of business, San Francisco, Cal. Location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of December, 1893, an assessment, No. 1, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 4, No. 330 Pine Street, San Francisco, Cal., or to the President, Tyler Beach, St. James Hotel, San Jose, Cal. Any stock upon which the assessment shall remain unpaid on the 26th day of January, 1894, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 17th day of February, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. T. E. JEWELL, Secretary.

Office—Room 4, 330 Pine Street, San Francisco, Cal.

DELINQUENT SALE NOTICE.

CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

NOTICE.—There is delinquent upon the following described stock, on account of assessments levied on the 22d day of November, 1893, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
H. P. Brown	2	330	$660 00
Morgan Backus	3	330	660 00
Geo. W. Craddock	6	50	100 00
C. L. Walcott	8	280	560 00
T. P. Robinson (not issued)	9	330	660 00

And in accordance with law and an order of the Board of Directors made on the 22d day of November, 1893, so many shares of each parcel of such stock as may be necessary, will be sold, at the office of the Company, 408 Sacramento St., S. F., Cal., on the 8th day of January, 1894, at 12 o'clock noon of such day, to pay delinquent assessments thereon, together with the costs of advertising and expenses of the sale.

MORGAN BACKUS, Secretary.

408 Sacramento St., S. F., Cal.

NOTICE TO MINE OWNERS!

The undersigned will have in operation at the Midwinter Fair a complete free gold and concentrating plant, where they will work, free of charge, any lots of ore from one to five tons.

For further information address them at 213 First Street, San Francisco.

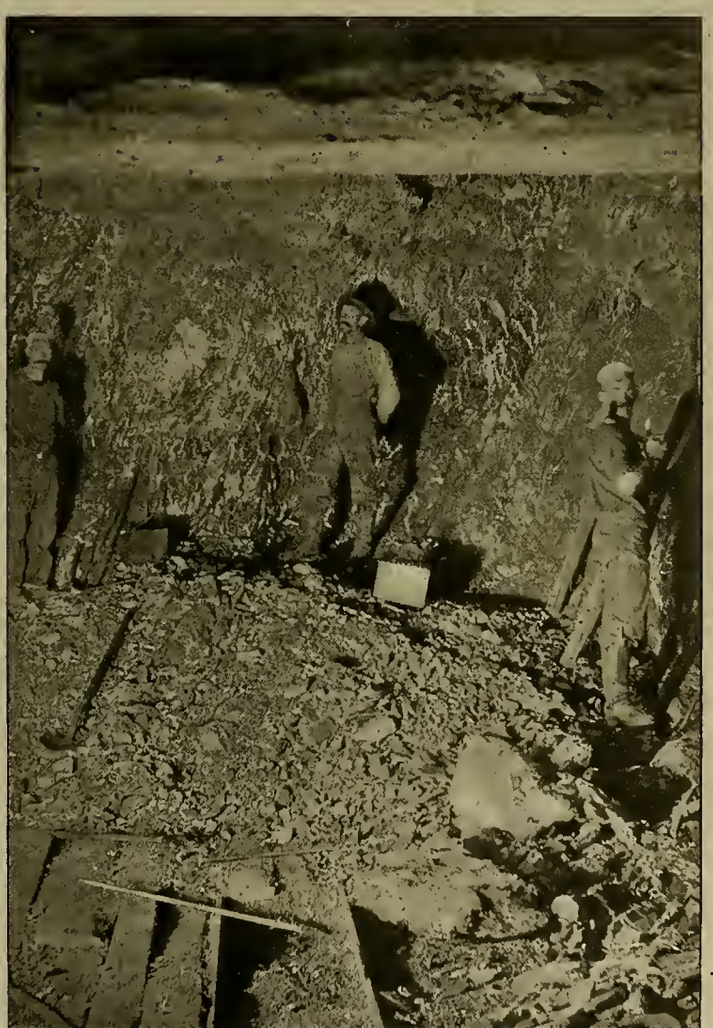
The Duty on Lead.

The address of several leading lead and mining companies to the miners of the United States, published in the MINING AND SCIENTIFIC PRESS, December 23, states succinctly the probable effect of a reduction of lead duties by the proposed new tariff law. The mining interest is practically a unit in opposition to the measure, being fully convinced that it contains a grave menace to the life of the industry. Without doubt the clause will be bitterly fought in Congress, but with what success of course remains to be seen.

The favorite argument of advocates of a low tariff is that the smelters are obliged to import a large amount of Mexican and British Columbia ores for a flux. But let us see into what consequences, in the judgment of many, the American industry will be involved if the gates are thrown open to all the world, and Spanish and all foreign ores are allowed to be brought in under a nominal duty. The price of lead in America depends upon the price in London, and is theoretically the same plus the ocean freight and the tariff. Actually, the New York price is less, being forced down to bedrock in the United States by competition between American companies. To illustrate: The quotation in London December 1st for soft Spanish lead was a trifle over 2 cents per pound (£9 10s per ton, to be exact). In New York the same day the quotation was 3.3 cents, a difference of 1.3 cents. If the duty on metallic lead is reduced to one cent per pound it is safe to say that the same Spanish lead will be laid down in New York for substantially the same price as in London, plus the one cent duty. It is claimed that ships will carry lead in ballast from Spain to New York for $1 per ton. The highest quotation for Spanish lead in New York would then be three cents per pound, and the probability is that it would be lower. There is only one way in which American mines can enter into competition, under these conditions, with the Spanish product, at New York, and that is by reduction of wages, smelting charges, and railroad freights both to the smelter and to New York. There are good reasons why the first named should not be done. There is no prospect that the second can be done, for the reason that the smelters are running now on a small margin of profit; and there is little hope of the third. There seems to be no alternative for many mines which are operating but to shut down, and for many which are idle to stay idle.

During the past few years several large smelters have been established in Mexico—started, many claim, because of the American lead tariff and the necessity in Mexico of economical reduction at home. However that may be, these smelters are in operation and they will be fostered by the Mexican Government; so that it is among things possible that an export duty will be placed on lead ore (if the Wilson bill goes into effect), that the product of the mines may be retained for the Mexican smelters. The purpose of the American tariff measure, so far as Mexico is concerned, would thus be defeated, and one foreign competitor for this market would be taken out of the way of Spain.

AT the recent annual meeting of the Geographical Society of California Fred W. d'Evelyn, first vice-president, read the report for the past year. He said the number of members is growing satisfactorily, and there are now 438 names on the roll, of which five are honorary, thirty life, and 403 contributing members. The position of secretary, vacated by the resignation of J. Studdy Leigh last July, has since been filled by Peter McEwen. During the year several valuable works were added to the library, which now has 1000 volumes. The society has also a valuable collection of lantern slides, most of them having been made for the purpose of illustrating comparatively unknown types of tribes and races in Africa, Sumatra, Borneo and other distant countries. These slides will be found particularly useful for illustrating ethnological lectures, and will add very considerably to the educational features of the organization. Exchanges are made with scientific institutions in almost every civilized country of the globe. Directors for the ensuing year were elected as follows: A. L. Bancroft; George W. Davis, M. D.; F. W. d'Evelyn; Edwin Fretwell, Dorville Libby; Rev. Frederic Masters, D. D.; Dr. G. A. Moore, Cyril W. Newall, Hon. W. H. Pratt, Frank Shay, S. H. Strite.



CAUNTER VEIN IN MAYFLOWER MINE.—*See page 419.*

THE proposition to place coal on the free list is generally regarded with favor by California manufacturers, for the very important reason that it means cheaper fuel, with all its attendant benefits. But, in the State of Washington, it is looked upon quite differently. The largest market for British Columbia and Washington coals is San Francisco. Is is well known that the foreign coal is superior to the Washington product; but its advantage does not end there. Many Chinese and Japanese are employed in the former, cheapening the cost of production. The veins are nearly horizontal, while the Washington pitch at angles from 45 to 60, making mining naturally more expensive. The British mines are nearer tide water, making transportation cheaper. All in all, the advantage is estimated to be about $1.50 per ton in favor of the outside article, in which the 75 cent duty only partly offsets. The Southern Pacific Railroad owns the Carbon Hill mine in Washington, and the Como on Vancouver Island. If the duty is removed, it is believed that it will shut down the latter, and operate the former only. All of which goes to show that protection of coal is strictly a local question, so far as it concerns Pacific Coast states.

THE hard times have driven the principal Colorado smelters into a pool, whose purpose has not been publicly announced, but which is understood to have ultimately in view divisions of territory as well as uniform smelting charges. It is said also that, taking the hint from methods in vogue among the railroad companies, it is proposed to plan a higher charge in all of the paying properties so as to equalize higher losses on others. It is the opinion of smelting men that the charge for crude ores should be $14 per ton. The charge for siliceous ores is now $13, having been recently advanced from $12. The companies represented at the conference were the Omaha and Grant, the Globe, Philadelphia, Pueblo and Colorado.

A RECEPTION of unusual interest took place at the Mechanics' Pavilion last Friday night, December 22d. It was tendered by the Mechanics' Institute to the workingmen who were engaged in the construction of the warship Olympia. The attendance was very large. A. S. Hallidie made a happy welcoming speech, and, in the course of the evening, addresses were made by A. W. Stahl, naval constructor, and G. W. Dickie, general manager, of the Union Iron Works, and Major C. A. Woodruff of the United States Army. He denominated the Union Iron Works as "America's greatest ship-building institution." The whole affair was a worthy tribute to the intelligence of the men who were actively engaged in the construction of the vessel.

THE executive committee of the Sacramento River Convention has chosen the following delegates to represent the convention at Washington in the efforts to secure Government aid for the improvement of the Sacramento and San Joaquin rivers: J. M. Gleaves, Redding; George Obleyer, Sutter; William Johnston, Sacramento; S. D. Woods, San Joaquin; Ed McGettigan, Vallejo; Mr. Edwards, Petaluma. Commissioners of the river counties will be asked to contribute $300 each, for expenses.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 431.

THE International Exhibit of Mining and Metallurgical Machinery, announced to take place in Santiago, Chili, in April 1894, has been postponed until September. The object of the Chilian Government is to introduce the most modern and best mining machinery and appliances which scientific discovery and invention have developed as practical factors in her great mining industry, which represents $60,000,000 of annual exports of ores, minerals and metals. The liberality of the Cbilian Government toward exhibitors will remove all reasonable objections on the part of our machinery manufacturers, so far as they are based upon the distance to Chili; while the annual importation of machinery into Chili, aggregating $8,000,000 a year, would seem to offer for their consideration a valuable foreign market for their machinery.

GOVERNOR WAITE has issued the long-talked-of call for a special session of the Legislature of Colorado, to meet January 10th. The call consists of about 5000 words, and mentions over 30 subjects on which legislative action should be taken. The first business for the Legislature suggested in the call is to provide that all silver dollars, domestic and foreign, containing not less than 351¼ grains of fine silver, shall be legal tender for all debts collectible in Colorado. So much opposition has arisen to the extra session in Colorado that it is seriously doubted if it will accomplish anything.

SUPERINTENDENT DAGGETT of the Mint has announced a batch of new appointments. They are as follows: Abraham Norton, Los Angeles, Assayer's computing clerk; Henry B. Renn, Siskiyou, foreman annealing room; Samuel Ward, Tehama county, workman; James H. McGinnis, San Francisco, workman; Frank M. Luttrell, helper; A. W. Mariscb, San Francisco, blacksmith; Frank C. Eichelroth, Tuolumne, workman; William P. Cahill, watchman; Andrew J. Moulder, San Francisco, clerk. The appointments are to take effect Jannary 1st.

THE Hartford Consolidated Mining Company, with offices at 1012 Fourth street, Sacramento, has issued a very attractive prospectus. The company has purchased and will develop the Hartford, Red Deer, Cnrtis, Brown, Ida, Sacramento, Gold Crown, Red Cloud, Golden Gate and Cupper King mining claims, in Shasta county. The owners were M. J. Curtis and A. D. Bowley.

THE gold crushings at Witwatersrandt for month of October, were 138,599 ozs. This is 2,530 ozs. in excess of the output in August last, the previous largest.

SECRETARY CARLISLE does not recommend the coinage of the seigniorage of silver in the Treasury, although he has put the mints in readiness for it.

THE American Bimetallic League proposes to open headquarters in Chicago, with Editor W. H. Harvey, of *Coin*, in charge.

Low-Grade Ores Pay.

It is claimed that the Empire mine, in Montana, produces $3 ore at a profit; and the Penobscot, which was once shut down because $25 ore could not be handled, now works $5 ore successfully. These things illustrate very forcibly the improvement in modern mining and milling machinery. There are many mines on this coast which were once unprofitable because of expensive mining or milling—particularly the latter—but which may now be regarded as certain to yield remuneratively if judicious methods are applied to their re-development. Cases are now exceptional where the ore may not be reduced with very small loss. Between the various efficient types of milling machinery and the process of sulphuret treatment, ore that is very low grade and of steady quality may now be regarded as certain to pay well. It is not possible, for many reasons, to fix an invariable figure representing the minimum of profitable low-grade ore. Conditions vary at different mines and mills; but there are many of these conditions which can be determined with reasonable precision before a stamp is dropped.

Under average conditions, from $3.50 to $4 represents the minimum figure in California quartz mines. There are numerous separate instances where this record has been beaten. They are useful as examples of the application of high skill in conduct of mine and mill, as well as judicious business administration; but they are not criterions. They show what may be done under favoring circumstances, and, in many instances, they likewise show how adverse circumstances may be overcome. The Alaska-Treadwell is the best instance of a gold mine operated on a large scale yielding profitable returns on low-grade ore; and the Spanish mine, in California, on a small scale.

Comparatively speaking, gold-mining is now a low-grade proposition. Instances where a mine produces steadily $30 to $50 per ton, as in early days are rare; and one may fairly think he has a bonanza if he strikes a $10 proposition, with available water power or fuel, accessible supplies, and other conditions which are indispensable to the economical development of a claim. Other things being favorable, $10 ore means $5 profit, and if the ore deposits are sufficiently extensive, $5 profit means a fortune. From $10 to $12 is the average of ore worked in California. It is difficult to estimate what is the average cost of mining and milling; but, including business administration, interest on investment, and all charges that properly enter into expense and are in any way connected with mining operations, probably the average is not above $8. Where a mine has its own mill and chlorination or similar works (where needed), the cost should be less. The cost of mining and milling in the Nevada City district is, on an average, less than $5 in the principal mines. The ore carries a very high percentage of sulphurets, which have perhaps 15 ounces of silver to the ton. It is estimated that the silver alone pays the expense of chlorination. The concentrates are worth perhaps $200 per ton.

There are many idle mines in California which ought to be producers, and which, if operated prudently, could be. It cannot be disguised that in recent years an undue share of sloth and neglect characterized the operations of quartz mines in the State. In the past two years, the aspect of things has been materially changed, and a great deal of attention has been paid to gold properties. The result is that many prospects have been turned into mines, many idle mines re-opened, much done toward giving new life and health to the industry. New confidence has been inspired in the permanent valne of California mines. Gold-mining is now a science. It was, in its early days, pnre speculation. Study and experience have added vastly to the fund of geological and mineralogical knowledge possessed by Californians; inventive genins and experience have rendered the mechanical reduction of ores a comparatively perfect process; and what mechanics lack, chemistry has largely supplied. All this knowledge is put to its highest and best use in California; but it ought to be much more widely applied. It is not possible for every one to strike a Utica, or a Brown Bear, or a Kennedy, or a North Star; but it is possible to get hold of mines that will pay good returns on a reasonable investment. Gold-mining in California has a glorious past; but it has in store an even more splendid future—a future wherein pluck, technical skill and good common sense learned from experience, will achieve all that was in the past due to pluck, imperfect appliances, and, in some degree, at least, to luck.

WHEN lead recently reached 3.0 cents per pound in New York, it broke all previous records by .2 of a cent. The lowest previous figure was 3.31, in June, 1878.

IN the January *Overland*, Mr. A. S. Hallidie pays a fine tribute to the worth an character of the late William Tell Coleman.

Drift Mining on McRea Ridge.

Drift mining in California is a growing industry. It received a very great stimnlus when hydraulic mining ceased, and there has at no time been diminution of activity. Drift mining, properly conducted, is, as a rule, very remunerative. In early days, large fortunes were sunk in search for gravel channels—often nnavailing—but better luck has attended recent efforts, for the simple reason that better methods have been applied; and better methods have prevailed because of increase of knowledge on the subject. Literally, millions of dollars yet remain uncovered in these ancient river beds, offering an alluring prospect to mining men.

A big scheme in drift mining has recently been inaugurated by Messrs. A. N. Towne, J. B. Wright, J. J. Crawford, F. S. Chadbourne, M. R. Higgins, and T. H. Williams Jr., gentlemen all very well known in California. They have made several locations along the McRea Ridge in Plumas and Sierra counties. Besides, they have (or are supposed to have) bonded the adjoining properties of the Beckwith Consolidated Mining Company, and the Franklin Consolidated Mining Company, for $75,000 each.

It is declared to be the intention of these capitalists to drift into the McRea Ridge, which no doubt covers an ancient gravel channel. This is the country from which large nuggets of gold were taken a few years ago—one valued at over $3000. These were taken from what is snpposed to have been a break from the ancient channel in McRea Ridge. One company realized over $50,000 in four years, though working in a small way only.

It takes money to prosecute drift mining, and the names of the gentlemen interested is a guaranty that it will be furnished in sufficient quantities, if it is once decided to develop the claims.

THERE are prospects that those persons opposing free raw materials in the Wilson bill, iron and lead ore, lnmber, etc., will concentrate their efforts to secure changes in the bill in the Senate. Delegations representing these various interests will be in Washington during the coming week to begin the work, Democrats, as far as possible, being delegated to make the protests. John M. Burke of Idaho, the advance guard of the lead men, is there and will be joined in a few days by others representing the States of Montana, Wyoming, Nevada and the Territory of Utah. Burke says free lead ore will absolutely paralyze the mining industry of the States and the Territories named. If the duty on lead ore cannot be retained, in part at least, by the Wilson bill, the lead miners will ask for the retention of the duty of 2 cents on pig lead, reduced by the Wilson bill to 1 cent. An effort will be made on the part of the representatives of the several interests to the combine so as to secure concerted action, but whether the combination can be effected is uncertain.

ADVICES from South Africa are that serious rioting took place at Johannesburg, Tuesday, December 26th, among the natives at Witwaterstrandt. The natives who were engaged in the disturbance were mostly employed in the mines and numbered about 2000. About 100 men are said to have been wounded, of which six are seriously injured. The rioters also sacked and tried to destroy one of the pnblic buildings, but were eventually dispersed by special police. These are simply meager details which may be greatly exaggerated, bnt they seem to indicate the continuance of serious differences between the whites and natives, which will eventually end in the displacement of the native labor. There has been a large influx of miners into the Transvaal, and it was and is inevitable that there should be a conflict between them and the natives for work in the mines. In such a contest the weaker nation invariably goes to the wall.

E. C. ENGLEHARDT of Deadwood, Tobias Gaster of Lincoln, Nebraska, and Dr. J. A. Paddock of Deadwood, have established metallnrgical works and a laboratory at Denver for the testing of gold and silver ores and investigation of leaching processes, such as the Russell, cyanide and improved chlorination process discovered and patented by Mr. Englehardt. To coin a word, bromineation is to be the method. Chlorine is not used in any manner. Several propositions for the use of the procees are said to be under consideration by the owners. The proposals come from Montana, Colorado, Utah, the Black Hills, and from every mining district in America letters of inquiry as to its adaptability to ores are received. At the works, tests of 100 to 1,000 pounds of ore will be made and the owners informed of the cost of treatment.

CHARLES F. HOFFMAN will read a paper, entitled "Notes on the Golden River Drift Mine, Better Known as the Red Point Mine," at the meeting of the Technical Society of the Pacific coast on January 5th.

The Mother Lode.*

By Dr. Stephen H. Emmens.

Traversing the lower portion of the foothills in a line parallel to the main chain of the Sierra Nevada is an east-dipping belt of slates and eruptive rocks, which continues without intermission for more than 100 miles across the counties of El Dorado, Amador, Calaveras, Tuolumne and Mariposa. Chief among the members of this belt is a graphitic slate seamed with veins of quartz and bordered by walls of greenstone. This quartz-seamed and greenstone-bounded band of slates is the great "Mother Lode" of California, and is deservedly famous as the richest gold-bearing formation of equal magnitude that has ever been discovered in the whole history of mining. Owing to the softness of the slate, as compared with the quartz and greenstone, the outcrop of the mother lode is conspicuously marked from place to place by huge white or green rocks rising boldly from the surface of the ground.

The quartz bodies of the mother lode occupy fissures in the slate and greenstone. These fissures are irregular, and sometimes cross the slate in both dip and strike; but for most part they are conformable. I regard the veins thus formed as being distinguishable into the following four classes, viz.:

1. The hanging-wall veins. These are mainly contact deposits between the slate and eastern greenstone, and are almost always regarded as the principal veins in Amador county.

2. The foot-wall veins. These are discontinuous bodies of limited extension, both longitudinally and vertically, and are found at various distances west of the hanging wall.

3. Caunter-veins. These are bodies that cut across the slates in dip and strike, and are usually of minor importance except as stringers and feeders, which, if followed, frequently lead to large masses of ore at their lines of junction with the other veins.

4. Greenstone veins. These are quartz-filled fissures in the greenstone walls. In bygone years they were almost completely ignored or disbelieved in; but modern developments have shown that they are of a very great value.

An inspection of plates I and III published in this paper last week and plate I in this issue will enable an accurate idea to be formed of the ore bodies in the mother lode.

Plate III is a view taken at the end or "breast" of the level now being driven south on the hanging-wall vein of the Mayflower mine at a depth of about 300 feet from surface. In the upper left-hand corner the smooth and regular hanging wall itself may be observed, and under this is seen the huge mass of slate and quartz forming the vein, while on the right hand are timbers that serve to keep the level open.

Plate I shows the breast of a greenstone vein lately discovered in the 800-foot level of the Gover mine. The walls are not seen, as the vein is some 50 feet in width. It consists of an almost solid body of rich gold-bearing quartz, and is found continuous down to the 1000-foot level, which at present is the deepest working. This magnificent bonanza, when first met with, consisted of a mere seam in the greenstone, and in the early years of mining on the mother lode would have passed without notice. But Mr. A. B. Call, the superintendent, and Mr. Robert McF. Doble, one of the directors of the Gover mine, very judiciously determined to drive north on the seam, and were rewarded by finding it widen out into one of the finest ore bodies ever discovered.

The plate in this issue shows a large caunter-vein at the 300 level in the Mayflower. It has no well-defined walls, and is virtually an interlaced network of veinlets and patches of gold quartz disseminated through the main body of graphitic slate for a width of about 14 feet. A comparison of this with plate I will enable the laminated character of the slate breast to be distinguished from the massive appearance of a solid body of quartz. At the top of plate III is seen one of the cross timbers supporting the roof of the drift, and at the bottom is some flooring for facilitating the work of shoveling up the ore.

Experience in all parts of the world has shown that the metalliferous veins of each mining district have local characteristics; and a knowledge of these distinctive features is required for the efficient development of the mines. The history of mining on the mother lode in Amador county is an excellent case in point. For many years the gold deposits were believed to be more or less superficial and pockety, and immediately a vein became poor in depth or longitudinal extension it was abandoned. At a later date the wisdom of driving levels along poor veins until they opened out and became rich again was recognized; but the idea still prevailed that it was hopeless to pursue them in depth. Finally, a few adventurous spirits were enterprising enough to take up some of the abandoned shallow mines and sink the shafts a few hundred feet deeper. They then discovered that the barren zone was of no great magnitude, and that a second series of rich ore bodies existed below. It is now recognized by every mining or geological expert who has examined the mines of Amador county that there are two zones of gold ore in the mother lode—one extending from the surface to a depth of usually 600 or 700 feet, and the other commencing at about the 1100-foot level, and extending to a depth at present unlimited. The Eureka mine, for example, at Sutter Creek, about two miles south of Amador City, has rich ore in the bottom level at 2200 feet from surface. This rule of the two zones is so general that as yet no exception is known. *Every* mine on the mother lode that has had rich ore at surface or in shallow levels, and has been sunk a few hundred feet below the line at which the shallow ore "petered out," has proved richer in depth; and as there is no claim on the whole course of the mother lode which has failed to yield rich ore in its upper portion, so it may be said with literal accuracy that there is no claim on the mother lode which will not prove successful if properly developed. I have never yet heard of or met with any other mining district of equal extent of which the same assertion could truthfully be made, and in this respect the mother lode stands unique as a field for the *certain* and *profitable* investment of capital. In saying this I of course allude to mines which *really* are situate on the mother lode. Claims are often located on side veins and deposits, and are boldly dignified by the title of mother-lode mines; but no competent expert need have any difficulty in distinguishing their true character.

It must not, however, be understood that the two gold zones are marked out in a precise and unvarying fashion. This would be impossible in any large geological area where the forces producing fissures and vein-matter have operated over many miles of country and through rock masses of diversified character. In some places the upper and lower zones approach each other very closely, and the intervening barren ground is correspondingly decreased; while in others there are found "chutes" or "chimneys" of rich ore which descend without a break from the upper to the lower zone. These chimneys are generally of comparatively limited length in a horizontal direction, and have a northerly dip. Their values are always large, and sometimes reach into the millions.

But while the methods and notions of the early miners have thus been advanced upon, and properties which they abandoned have been re-opened and made highly productive, the progress achieved still leaves untouched some important elements of value. Exploration on the mother lode has been confined too much to the hanging-wall and foot-wall veins, and as yet no mine can be cited in which there has occurred any systematic development of the "caunter" and "greenstone" veins. The importance of these is only now beginning to be recognized in spite of many chance discoveries which ought to have opened the eyes of the miners. For example, I was told by one of the old miners in Amador City, who was one of the men concerned, that in the early days of Bunker Hill—now the "South Mayflower"—a drift on the hanging-wall vein was inadvertently carried on into the greenstone and there struck a body of ore which was so rich that it yielded $2000 in gold for every barrel full. Yet this was looked upon as a mere "pocket," and when it was worked out no attempt was made to drive on the vein that led from it into the greenstone north and south.

Again, in the same Bunker Hill mine, a small caunter vein was accidentally encountered in the 400-foot level. It was driven on for a few feet, and then widened out into a body of fine milling ore, 40 feet in width and yielding $14 per ton in free gold. This bonanza lasted down to below the 500-foot level and yielded enormous profits. It was found to split up into stringers and to thus "peter out" into the surrounding slates above and below and at its two extremities, but its lesson was not learned. No systematic driving on caunter veins was undertaken, and such other bonanzas of a like character as may exist are still remaining untouched for the present owners to discover.

The discovery of the greenstone vein in the Gover mine, shown in plate I, is another instance of neglected opportunities. I was, by the courtesy of Mr. Call and Mr. Doble, allowed to personally inspect the mine, and trace the vein from the point where it was first cut to the present workings. I found the vein in question to be a striking protest against the notion, so cherished of miners, that exploration should cease when a well-defined wall is reached. On the mother lode, in particular, this theory has been rampant and delusive. Immediately a fine, smooth hanging-wall of hard greenish rock is met with, the crosscut is suspended and drifting commences along the wall. And yet, on close scrutiny, it is frequently possible to observe a distinct slaty structure in this greenstone—a structure quite distinct from that of the massive, granular, crystal-filled diabase that forms the true boundary of the lode. Where such slaty structure exists, a path of low resistance is provided for the occurrence of fissures, and it becomes highly probable that the same forces that fissured the slates simultaneously rent the slaty greenstone. But the driving of a crosscut through a solid hanging-wall into the greenstone behind has been too pestilently heretical a proceeding to have found favor in the eyes of "practical miners;" and there is not a mine on the mother lode that has ever been thoroughly prospected in the eastern or hanging greenstone. The new bonanza at the Gover may be expected to change this state of things; and the stock-holders of the Mayflower gold mine and the Chicago Gold Mining Syndicate need not regret the past neglect, seeing that the eastern ground has thus been allowed to remain untouched for their benefit.

*Dr. Stephen H. Emmens, the chemist and consulting engineer, who is now in this city as manager of the Mayflower gold mine, Amador county, and Chicago Gold Mining Syndicate, has just issued a report to the stockholders of the Mayflower and South Mayflower gold mines. It is in neat pamphlet form, embellished with numerous half-tone engravings from photographs by N. W. Emmens, showing several interesting geological features of the mother lode in the vicinity of the mines; the underground workings of the Mayflower and adjacent Gover mine; the surface works; water power ditches; Amador City; and other scenes likely to be of interest and value to the stock-holders. The matter of the report has been presented in most excellent style. It is finely classified, and carefully prepared. The situation is first described. It embraces a hasty sketch of the topographical features of the Sierra Nevada mountains. Then come the geological features of the mother lode; then the history of the two mines; their present condition and prospects; their workings; mill and chlorination works; and concluding remarks. The above are, slightly abridged, Dr. Emmens' views of the mother lode.

Senator Chandler, of New Hampshire, proposes to introduce in Congress a resolution asking the United States to invite all the countries of the world—Eastern, Western and Southern—to attend a monetary conference. The new feature of the proposed conference is that it shall not be restricted to European gold-standard countries, but shall include South American and Oriental silver-standard countries. Moreover, the invitations to the conference are to contain the declaration of the United States that the purpose of the conference shall be the establishment and maintenance of an international ratio, with a specific declaration added that, if such a ratio cannot be agreed upon, it will be the purpose of the United States to adopt a single standard, and that standard not gold, but silver. By taking this extreme position, not as yet advocated in Congress even by radical silver men, Chandler thinks the hands of the gold-standard countries not now trading extensively with the Western world can be forced.

The Denver plant of the Omaha and Grant Smelting Company has completed a statement of the ore receipts and production of metals for 1893. The total production of silver was 7,591,425 ounces, an increase of 116,148 ounces over 1892. The production of gold for the year amounted to 82,404½ ounces, an increase of 19,202 ounces. These figures, however, are not an indication of the growth of gold or silver mining; they are simply a statement of the business of one large smelter. Other smelters have been shut down.

Foundry Notes.

The Union Iron Works has launched the new pilot boat Gracie S. The new "No. 3" is to take the place of pilot boat George Peabody, which was lately sold, and is considered the crack boat of the pilot fleet. Her cost was $17,000, and when launched she was fully ballasted, equipped and ready for sea. She is named after the eldest daughter of John D. Spreckels.

A representative of the Electric Storage Battery Company of Philadelphia recently held an interview with Vice-President Huntington of the Market Street Railroad Company and presented the merits claimed for his system. During the course of his remarks the representative stated that his company would guarantee its system to do the work at the expense of 3½ cents a mile. Mr. Huntington asked the gentleman if he would enter into a contract to supply the Metropolitan line with power, but the storage-battery man said his proposition only applied to roads on a level. In discussing the storage-battery question Mr. Huntington said that he believed the system would be perfected at some time in the future so that it would be available for roads with at least moderately heavy grades.

The first heavy piece of armor was placed on board the Monadnock, at the Mare Island yard, last Saturday morning by the aid of the large shears under which the monitor had been hauled the day before. The piece is what is known as the conning tower, a circular structure some 5 feet in diameter and 7 feet high, weighing 45,000 pounds. The next piece of armor to be hoisted on board will be the smoke-pipe armor, an oval piece of metal weighing 45,000 pounds. Twenty-one pieces of armor for the sides, weighing over 500,000 pounds, have already arrived, and more are on the way from the East. It is expected that about the middle of next week the monitor will be floated in the drydock, and five of the stern pieces of armor will be set in place. A derrick has already been erected on the deck of the vessel for use in this purpose. When the large crane now under construction at the East is completed, it will be sent out to the yard and used for all such heavy work as this. A track will be especially laid for holding the jib-crane. It will be a year before it arrives and becomes ready for operating. In the meantime wooden shears will be used, of the same style as that now seen on the stern of the Monadnock.

The Miners and the Farmers.

TO THE EDITOR:—If there are any of the hydraulic miners who are credulous enough for one moment to suppose that the strenuous opposition of part of the people of Sacramento valley to the resumption of the hydraulic mining has subsided, let them carefully peruse the report of the convention held in Sacramento last week, for the purpose of devising ways and means for the improvement of the rivers. Here are some extracts from speeches delivered by gentlemen who have been prominent in the crusade against this system of mining. W. S. Green of the Colusa *Sun* said: "Placer had put up money two years ago, but that was on the occasion of a grand handshaking business between the miners and the farmers. The valley is not going to throw down the glove to the miners now at all." Doctor Dixon remarked, "that he did not favor hydraulic mining, which destroys the rivers, but if the miners will assist us, for God's sake let them do it." Good Grove L. Johnson, the Blackstone of Sacramento, complacently remarked that he "looked upon the miners as natural enemies, but he was in favor of letting them in if they will give any money. The miners will get all the chestnuts and the valley all the fire." The miners, he said, "have no interest in this plan, except as individuals of California." He was convinced "that the best way would be to stand alone." Senator Rose of Colusa, said "that Placer had failed to send a representative; and besides, she was not interested in navigation." And it was decided to leave poor Placer out in the cold. These quotations were culled from the *Bee* of the 16th inst, and like the proverbial "straw," indicate the course of the anti-debris wind. They give unmistakable evidence of the deadly antagonism which still lurks in the breasts of the miners' ancient foes.

As already stated, the vigorous opposition arose over the attempt to place Placer county upon the executive committee of this body. The object of Placer in being represented upon this committee I fail to comprehend, but the attempt to make Judge Fulweiler an executive member has proved the real *status quo* of the controversy. The sentiments expressed are indicative of the course to be pursued by the Anti-Debris Association. We are clearly given to understand that in the great fight for supremacy—in our efforts to secure the rehabilitation of a legitimate industry that was suppressed through the efforts of a few professional agitators of the Sacramento valley—we must expect little sympathy or assistance from the hands of the farmers.

Two years ago, at a convention held in San Francisco, the miners extended to their opponents the right hand of fellowship in *prisca fides*. They were prepared to bridge the chasm which had separated them so long and were willing to accept any measure that proved satisfactory to both parties. They informed the representatives of the valley interests that they would abide by the judicial decisions affecting their interests pending legislation by the National Government.

That the miners have "kept the faith" is a matter of history. That the farmers, or their representatives, have been as unfaithful as the miners have been faithful, is also a matter of history. Their action in Washington and also in Sacramento, is conclusive proof of this statement. They have done more to injure mining—hydraulic and quartz mining both—than any other agency or influence in this State. Because of the agitation which they have conducted against hydraulic mining, the impression prevails in the East, and in Europe, that all kinds of mining are illegal in this State, and millions of dollars of capital have no doubt been perverted as a consequence. They have succeeded in suppressing an industry that was capable of producing at least $10,000,000 annually. They carried matters with a high hand for a while. They dictated to the hydraulickers just what they should and what they should not do. But there is an end to all things. And time brought an end to the rule of the Anti-Debris Association. The unjustness of their position was apparent to every fair-minded person. The appeal of the miners to Congress and the State Legislature was successful, despite the determined opposition of the paid agitators of the valley. They were given ten years in which to make good their promise to compensate the commerce of the State, to the amount of the loss sustained through the suppression of hydraulic mining. Have they done so? Have their products increased to the amount of $10,000,000 annually? Commercial statistics fail to reveal the fact, and the miners challenge them to produce any evidence that will show increased production in their industries other than in proportion to the increased production caused through the march of modern progress.

Is it not only just and logical, then, in view of the circumstances, to revert to the system of hydraulic mining? It is imperatively demanded. Commerce demands it. The people of the whole State demand it. And it is the height of presumption to think that the Sacramento valley is greater than the State of California. But they cap the climax by their audacity in asking the miners to contribute money to defray the expenses of their campaign.

SAMUEL BUTLER.

Grass Valley, Cal., Dec. 18, 1893.

The Mining Exhibit.

The Midwinter Fair management has delayed the formal opening for a short time, though the gates will be open January 1st. The reason is that the exhibits are not in place and the buildings are not all finished, though very near completion. The delay will be only for a few days. The time of opening will be announced later.

The mining exhibit is making excellent progress, and it will undoubtedly be one of the great features of the exposition. Supt. Benjamin has shown himself to be possessed of great energy and administrative capacity, while the executive committee has discharged its task faithfully. The oft-repeated statement that the exhibit of minerals in bulk and quality will be the finest ever made will be fully verified. It is the purpose of this paper to give a complete review of this part of the fair.

The stamp-mill will be placed in a building by itself. It was feared that the incessant pounding of the stamps would interfere with some of the electrical apparatus and connections, so it was determined to erect a building just outside of the Mechanic Arts building on the south. The structure will be 26x50 feet in its dimensions, and it will contain a complete quartz-mill outfit with the latest appliances for working all kinds of gold-bearing ores. It is also the intention to show the different processes for treating and saving the gold. Large quantities of ore are being shipped from the mining districts to be worked in the mill during the Fair.

Nevada county has adopted a handsome design for the individual exhibit, Architect Swain having made the plans. The prominent feature will be a large gilded sphere, supposed to represent a solid lump of gold of the value of $250,000,000, this being the amount of the total gold output of the county since mining began there.

Appeals have been made to the principal mines of the State to donate three tons of ore each, to be crushed in the five-stamp mills which will be operated as a portion of the mining exhibit. As each lot is being crushed an announcement will be posted indicating the mine from which it comes and the result of the milling. The product of the ore will go to the mining exhibit fund.

Tuesday, May 22d, is to be "Miners' Day," and the committee in charge of the mining exhibit is already arranging for the occasion. One of the entertainments will be the great contest in rock-drilling, to determine the championship of the coast.

Alameda county is to make a showing of some of its mineral resources. M. H. Mendenhall of Livermore has promised to send large quantities of chromium manganese, building marble and magnesia from the vicinity of Agua de Vida Springs, and the Treadwell gold mines will also make an interesting showing.

The foundations for the machinery operating plant of the exposition are now complete, and the engines are being placed as rapidly as possible. Work on the boiler plant is well under way. The shed which is to cover these boilers will not be erected until they are in place, but if it is found necessary to have power some of the boilers and engines will be utilized before the building is erected, by the adjustment of a temporary trestle on which to hang the piping.

THE annual meeting of the Ophir Mining Company was held recently, when 81,652 shares of the 100,800 were represented. Directors were chosen as follows: Charles H. Fish (President), Nat. T. Messer, William S. Lyle, C. O'Connor, Herman Zadig, George R. Wells and A. W. Havens. E. B. Holmes was retained as Secretary, D. B. Lyman as Superintendent and the Nevada Bank as Treasurer. A cash balance of $3302 was reported. Only 49 tons of $19 ore was crushed during the year. Two assessments of $75,600 were collected in the last fiscal year. Another of 25c. per share has been levied.

THE Clayton Air Compressor Works has issued, in pamphlet form, a very useful pamphlet on the "Widening use of Compressed Air," written by Whitfield Price Pressenger, and published in the *Engineering Magazine* for November, 1893. It is a review of the many purposes to which compressed air can be applied, and especially for power purposes.

THE Altura Gold Mining Company, capital stock $250,000, and the Vanderbilt Mining and Milling Company, capital stock $1,000,000, have filed articles of incorporation; both at San Bernardino.

The Grass Valley District.

EDITORIAL CORRESPONDENCE.

GRASS VALLEY, Dec. 15th.

A large share of the activity which has marked mining operations during the past two years in the Grass Valley district has been on Oshorne Hill. The history of the various mines on the hill has been a record of profit up to a certain point, and then for various reasons, some sufficient and others not, they have been shut down. In early days Osborne Hill was the scene of immense activity and general prosperity, the various properties being as a rule highly remunerative; but it seems that after a depth of a few hundred feet the rock became hard and seemed to be growing more rebellious as sinking was pushed. It had not been demonstrated in Grass Valley that deep mining was profitable, and no effort appears to have been made on Osborne Hill to reach great depths. About 25 years ago there began to be a cessation of operations on the hill. One by one shafts were allowed to be filled in and water to possess the workings; there seemed to be no future for Osborne Hill, and for years it was little more than a golden memory. Not more than two years ago L. P. Goldstone, a well-known mining man, obtained possession of the Osborne Hill mine and started to re-open it. New steam hoisting works and pumps were erected and preparations made on a sufficient scale to demonstrate the value of the property. After a careful study of the Grass Valley district Mr. Goldstone had become fully convinced that no mine which discovered a good pay shoot within a few hundred feet from the surface would fail to disclose another at lower depths. The experience of other miners amply demonstrates this theory, and the Osborne Hill is now fairly on the way to be added to the list of rich mines. At the time I visited the Empire mine the mill of the latter was engaged in crushing rock from the Osborne Hill, and it was stated that the rock was very rich and returns of gold heavy. The surface works at the Osborne Hill mines are run by steam, and it is likely that the expense of mining was one of the factors in their closing down in early days. Other mines on the hill which have undergone much the same experience as the Osborne Hill may be mentioned. They are:

The Green Mountain, which has been shut down about 12 years. The shaft is now down about 400 feet and there is no doubt of the value of the property.

The Centennial mine, near the summit of the hill, and adjoining the Osborne Hill on the same ledge, has a record as a producer of about $500,000, and has paid $200,000 in dividends. In early times the mine was especially profitable—under another name, however—but, when in 1876 it was consolidated with adjoining properties, it was appropriately called the Centennial. In 1882 the mine became involved in litigation and operations were suspended. Within a few months past the property has passed into the hands of a Sacramento company, and active development is now being made. John N. Larkin is president of the company and A. W. Stoddart superintendent.

The Conlin mine, west of the Osborne Hill, has a new ten-stamp mill, and is a very promising property. The capital for development has been furnished largely by New York and San Francisco people.

The Orleans is a very large property, comprising a number of locations. The new hoisting works have just been finished. Sinking is now going forward on the Madison Hill location. The mine has been idle many years, but the owners are firmly convinced that it will develop into one of the best properties in Grass Valley district. The history furnishes ample ground for their faith.

The foregoing do not include all the mines now in course of active development, or rather redevelopment, on Osborne Hill; but they are sufficient evidence of the awakening which has taken place in this portion of the Grass Valley district. Considerable outlays of capital have been necessary in each instance, and employment given to many men. There is sound reason now to anticipate that the mines will prove steady and profitable producers and play a prominent part in the future history of Grass Valley.

A great deal of speculation has recently been directed toward the old Alison Ranch mine, on Wolf creek. This property was once one of the famous mines of California, if not the most famous; but many years ago, from causes not very well understood, operations were suddenly ceased and the workings allowed to fill up. It is said now that the mine has fallen into the hands of J. B. Haggin, A. E. Davis and others, and that they will in the early spring begin active work. The value of this property is not at all a matter of uncertainty; it is well known, and it is necessary only to put in the requisite works and reopen the mine in order that it may yield certain returns.

James D. Hague, Esq., principal owner of the North Star, has recently acquired possession of the Rocky Bar mine, on Massachusetts Hill, and it is stated also that he now owns the Stockbridge, Great Britain and New York Hill, and will work them all. Like other properties which have been mentioned, these have records as producers, and will doubtless contribute much in future to the material growth of the district.

E. B. P.

At the Midwinter Fair.

The time is at hand for the opening of the Midwinter Fair, and preparations are going forward with surprising speed. Things have been accomplished in the art of construction which seem almost incredible considering the days involved. Fortunately for the enterprise, we have had a season of exceptional salubrity, and each day finds some new building roofed from the floods which in the nature of things must soon come.

Our engravings are in part a demonstration to distant readers of the actuality of the enterprise. The upper plate of pictures is made from photographs of the buildings themselves, taken about December 1st, and not from architects' perspectives, so the views are real. One thing, however, is lacking in these reduced views, and that is that they do not carry the impression of size which the buildings themselves convey to the beholder. The buildings represented in the small pictures occupy the same correlative positions that the pictures hold, and the general view, including the three, is such as the beholder would get by looking from the Administration building the length of the central court upon the distant Manufactures and Liberal Arts building, which is the greatest structure on the grounds. It is probably a quarter of a mile distant from the camera. On right and left, in nearer view, are the two buildings next in size, that for machinery and the one for agriculture, while beyond the latter is the Egyptian style of building devoted to the fine arts.

The second plate on this page shows the building constructed by joint subscription of northern and central counties for the special display of their productions and resources. The southern California counties are also erecting a building of their own.

Much cannot be said of the beauty of the building in construction by the northern and central parts of the State. It will serve, however, as a neat and commodious pavilion, in the interior of which it is hoped the visitor will find greater interest than in its exterior. It will be 180 feet in greatest length by 150 feet in greatest width. The different counties participating in its construction have been awarded space as follows: Yuba, 950 square feet; Napa, 1400; Solano, 1400; Sacramento, 1400; Placer, 900; Butte, 900; Colusa, 900; Shasta, 250; Siskiyou, 250. This will not, of course, include all the counties exhibiting, for county exhibits will doubtless form a leading feature of the main exposition building devoted to agriculture. Our engravings are reproduced from the *Midwinter Exposition Illustrated.*

Placer County Quartz Mines.

TO THE EDITOR:—Although quartz exists in nearly every portion of Placer county, the majority of the located quartz claims are situated in the Ophir mining district, three miles south of Auburn, the county seat.

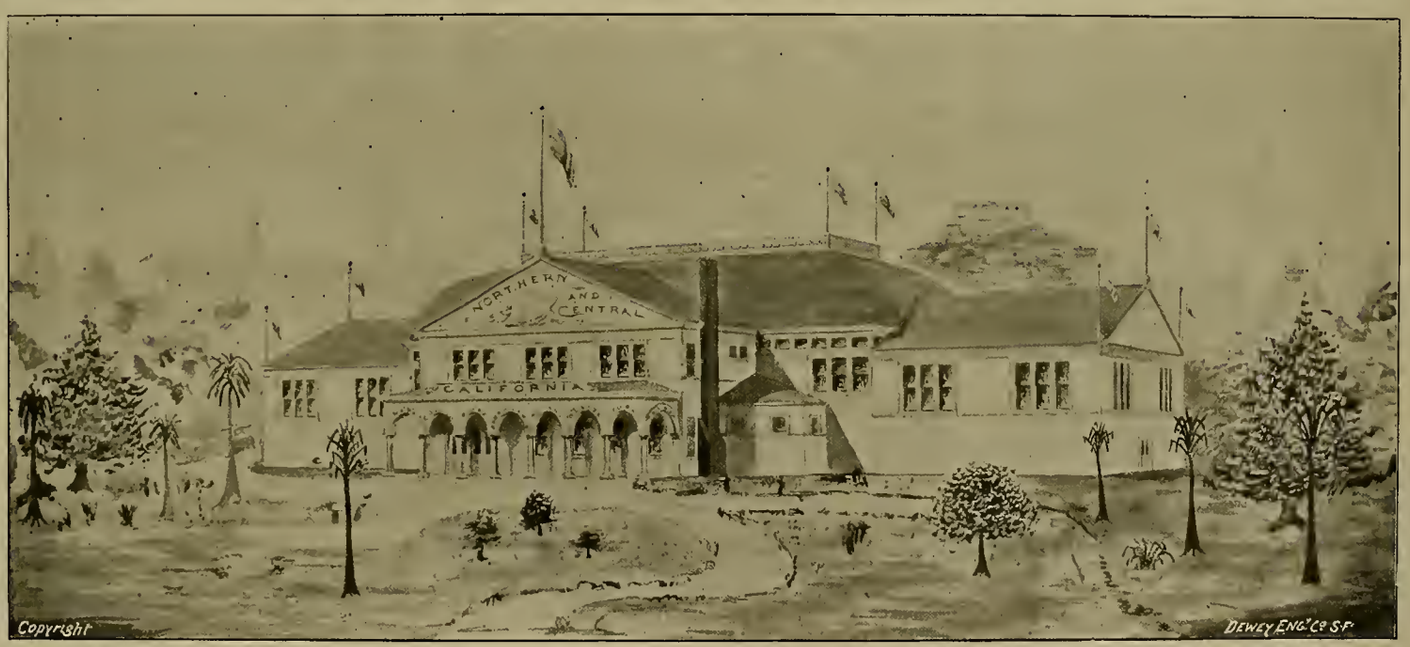
Ophir abounds with many claims that have produced gold in large quantities, the majority of which are not at present operated. But few claims in the district have been worked to a 300-foot level. Good paying rock was to be found in many of the mines when they closed down, but, with the increased cost of taking it out, under the directions of kid-gloved superintendents, the returns were not large enough to pay large salaries and heavy running expenses.

The section has often been called a specimen camp. The term hardly does the district justice. While it is true the richest ore runs in chutes depending upon the character of the granite formation, nearly all of the rock will pay a small profit when milled. It would seem as though the fact that the camp is but a mile from a railway station, and therefore easy of access, serves to work against it. Mint receipts show that a vast amount of gold has been taken from the mines of the district. "Distance lends enchantment," and it is the opinion of the writer that if the section was difficult to reach capital would be freely invested. However, the camp shows a change for the better, as is evidenced by the fact that work has recently been resumed at several mines.

Arrangements for work on an extensive scale are being made at the Three Stars mine, recently sold by B. F. Hartley to the Gold and Silver Mining Company of Colorado. Mr. Hartley has been chosen as superintendent. The ledge is one of the most prominent of its kind in the county, from four to eight feet in thickness, and stands in some places as high as 15 feet above the natural surface of the ground Pipe has been laid for a distance of 5000 feet to convey 60 inches of water, with a fall of over 300 feet, to furnish power to run the machinery. Shafts 1, 2, and 3 are being sunk. When the main shaft has reached a depth of 200 feet, drifts will be run the entire length of the lead, a distance of 3200 feet. The mine will have four Huntington mills of 100 tons capacity, Burleigh drills and an electric plant.

Work on the Hathaway mine has recently been resumed with Wm. Irwin as superintendent. He is working the mine on a lease in company with Martin Jones. They are now at work on the 200-foot level and 16 men are employed. Ten stamps of the 20-stamp mill are working an average of 18 hours per day. The ore averages $8 per ton exclusive of the sulphurets and the outlook is encouraging.

At the Boulder mine, which will be operated by D. H. Hutcheson and Luke Ferguson, the machinery for the hoisting works has just been put in place. The machinery will be run by water-power and they have just finished laying 2000 feet of nine-inch pipe with a pressure of 270 feet. An eight-stamp mill will be operated with two concentrators. Hundreds of tons of rich ore is in plain view. The present working force of twelve men will soon be increasing.



NORTHERN AND CENTRAL CALIFORNIA BUILDING AT THE MIDWINTER EXPOSITION.

At the Eclipse mine the mill is running on custom rock. This mine was purchased by Daniel Buck in 1890, who died two months later. He willed it to Dr. Wm. Blankman of San Francisco, the present owner. A superintendent under Mr. Buck took out 100 tons of ore that he estimated would go about $3 per ton, which remained in the mill. The estate is still in probate, but an order of court was secured by the present superintendent, Ben Hawkins, to crush the 100 tons, which averaged $27 per ton. W. R. Monahan and Ben Hawkins cleaned up $1176 in February, 1892, from 30 tons of waste rock which was thrown over the dump. Monahan is still working the waste rock on a percentage.

Adjoining the Eclipse is the Morning Star. The ledge runs from six inches to four feet, but the prevailing width is two feet. The main shaft is down 92 feet, with a drift running west 50 feet. A second shaft 70 feet east has reached a depth of 75 feet. The mine is at present worked by a

lease. Mint receipts show results from several crushings as follows: 128 tons, $7387; 34 tons, $382.33; 6 tons, Nov. 1, 1893, $582. The ore on the chute has run from $6 to $166 per ton, and has averaged $57.50. A portion of this mine is situated on land listed by the railroad company as agricultural lands.

Also inside the surface lines of the Morning Star is a part of the famous Good Easter mine, which was a large producer twenty years ago, but it is idle at present. A spur of the lead runs parallel with the Eclipse, and two years ago a connection was made from an Eclipse shaft to a perpendicular shaft on the Good Easter. It was very rich, but neither the owners of the Eclipse or Good Easter were gainers, as the honest miners retained it. The waste dump afterward paid $100 per ton. This mine is now filled with water.

J. Holbrook has four men at work at his June Bug quartz mine, and the main shaft has reached a depth of 108 feet. The ore looks very promising. About $75,000 was taken from a shaft 50 feet west some years agn.

J. W. McCullough, superintendent of the Mina Rica quartz mine, is running their ten-stamp mill on custom ore. The mine, whlch ls at present idle, has a 250-foot shaft, with 500-foot tunnel; also levels at 100 and 150 feet.

Wm. Pellow, who now owns the California mine, is working the waste rock on the dump by the arrastra process. The ore yields a steady average of $6 per ton.

The Bellevue extension on the east, owned by Edward Tremmelling, is being worked only by the owner. The main shaft is 180 feet, with drifts 70 and 80 feet east and west.

The Moore mine, owned by J. W. White, T. M. Tharpe & Son, is being worked by the owners. The ledge runs from 4 to 10 inches in thickness. They have reached a depth of 300 feet on the incline. At the 200-foot level an 80-foot drift is stoped to within 100 feet of the surface. Specimens of the ore are so rich that the owners crush them in a hand mortar, and they have pounded out during the summer more than $4000. While your correspondent was on the ground they were eogaged pounding specimens which wielded 108 ounces. All quartz aside from specimens has milled about $100 per ton. In sinking to the present depth the present owners have taken out over $40,000. Mrs. T. M. Tharpe has a cabinet of specimens taken from thls mine which is vaiued at $15 000.

Parallel with the Moore mine may be found the Centennial, Hope and the Conrad, all idle properties, but I understand that San Francisco parties will back mining superintendent Fred Dependener, who will soon have a force of men at work on the Conrad.

The Green mine owned by F. X. Lavalee, which has produced well ln early days, is not being operated at present.

J. Malmberg, who owns the Baltimore quartz mine on Baltimore ravine, has recently sunk a 20-foot shaft. The ore shows free gold and looks very encouraging.

Tharpe & White are opening an old tunnel on the Cox & Denton mine, owned by Mrs. Dr. Crandall, and will work it on a bond. The ledge runs from 18 inches tn three feet, and has paid some $40,000 at former workings.

George J. Morgan, owner of the New Year, Argonaut, Flat Lead and The Wilson, is doing no work on tbem at present.

N. Maring & Son, who own the Bullion, have a shaft that has reached a depth of 100 feet with a 50-foot drift. The ore has milled from $13 to $40 per ton, with sulphurets at $100 to $300 per ton. They are doing no work on the mine. IVAN H. PARKER.

Penryn, Cal., Dec. 23, 1893.

A New Road to the Yosemite Proposed.

Our readers in Stanislaus and Merced counties will be interested in tbe statement which is currently made that the Southern Pacific is considering the construction of a new branch road into the Yosemite valley, starting from a little south of Modesto and crossing the Oakdale branch near the town of Montpelier and thence up the valley of the Merced river to the Yosemite valley. This branch will be about 90 miles long. It will traverse a most important agricultural district, as well as unlock vast stores of lumber, building stone and minerals. It will also be a great boon to the traveling public, as it would allow one to reach the Yosemite valley in about 12 hours from San Francisco, so that a city man could leave town Saturday evening, pass Sunday in the valley and be back again at his work Monday morning. Something of this kind would be of vast public benefit. The present routes to the valley are too costly both of time and money.

THE DeLamar mines produced between March 1st and November 30th of this year 349,785 ounces of fine silver, amounting at par to $402,237. It has been sold, say at an average of 70 cents, amounting to $243,849 50, making a difference of $158,387.50 to the stockholders of the mine.

Hydraulic Mining.*

A REVIEW OF THE INDUSTRY BY DR. HENRY DEGROOT.

In Eight Parts—Part I.

Hydraulic mining consists of that method of handling auriferous gravel whereby the deposits in place are broken down and carried into the gold-saving apparatus by mean of water discharged upon them through iron pipes and under great pressure.

This system of gravel washing, which had its orlgin in California, was the result of fortuitous circumstances rather than foresight or design, its basic idea having been suggested by the merest incident. So obscure was its genesis that we cannot at this date determine just where or by whom it was first brought into use, several different persons and places laying claim to this distinction—so many, ln fact, and each with snch apparent good showing as to justify the suspicion that its lntroduction in these various localities might have been concurrent events.

As the discovery of this method was due to accident; so has its subsequent growth been the creature of evolution. From the smallest beginnings it grew little by little every year, bringing with it some lmprovement and adding something to lts efficiency, until it reached vast capabilities and gigantic proportions. Gradually the canvas hose has been developed into the giant nozzle, a single set capable of doing the work of a thousand men.

Among the many notable exploits for which our mechanics and engineers have been distinguished, the planning and perfecting of this process of gravel washing, with its attendant system of reservoirs, ditches and equipments, stands conspicuous, both as regards inventive ingenuity, daring engioeering, and the many novel expedients to which recourse has been had for overcoming seeming impossibillties.

Nothing appears to have been too vast for these men to undertake or too difficult for them tn perform. Great flumes bracketed to the face of tremendous cliffs, immense water flows transmitted by depressed iron pipes across yawning chasms, and trestle works lifted high in the air like the arc of the rainbow spanning deep gorges, stand monuments of their skill, eoergy and daring. So new and astounding have been some of these feats, we might almost fancy that nature, were she a sentient and conscious entity, shocked by their audacity, would eodeavor to administer a suitable reproof to the presumption of man. We pride ourselves, and justly, on these achievements, many of which have inured tn the benefits of the world at large no less than to the glory of California.

Few persons know—hardly any of those best informed understand—how great a destiny awaits the industry. It has a mission as wide as the world. It is going out to glean, or rather harvest anew, the ancient placers and even the gold fields of prehistoric times. It may be put to death here where it was born; here where it was cradled it may die.† Mankind have a habit of crucifying their saviors, and the prophet is not without honor save in hls own country—sayings fated perhaps to illustrate what is here in reserve for this method of gold mining. Be this as it may, though interdicted in the land of its nativity, other nations will have need for it; nations whose placer deposits were impoverished long ago to a degree that prevented their being worked by the crude and primitive methods then in vogue, hut which can now be rehabiiitated and made to pay worked by this better plan.

Europe, Africa and India were great gold-producing countries from 2000 to 4000 years ago, incredible quantities of the yellow metal having been gathered there by the more enlightened nations of those days; so, also, were Mexico, Central and South America, prior to the discovery nf the new world. Such having been the case, it is reasonable to infer that there exists in those countries deep gold-bearing gravel banks, similar to those found in this and other of the Pacific States. That no mention has been made of thelr occurrence is explained by the fact that in the absence of any means by which they could be profitably utilized they were supposed to possess no value, just as this class of deposits would have been considered valueless had never water under pressure been substituted for manual labor, and thus an amazing economy been worked in the manner of handling them.

In the early times alluded to, whole armies of men, usually slaves or prisoners of war, were employed in tbese mines, which, worked in this manner, yielded bountifully and witb large profit to the owners, or those who farmed them for the government. Sn far as the several last named countries are concerned, they are known to abound with these deep placers, some of which are now being exploited by the hydraulic process.

Only the past summer the announcement was made that a party of mining experts and engineers, sent by a New York syndicate to examine the foothill region of the Andes, in the Republic of Ecuador, found there an extensive district of auriferous gravel well adapted for this style of mining, these experts giving it as their opinion that there can be made by a single ooe of the several of the properties they have secured an annual output nf ten million dollars in gold-dust, and that at a cost of less than one million dollars, interest on capital included. These placers have worked from time immemorial, it being from this westerly slope of the Andes that the Incas of Peru obtained their great store of gold, afterward wrested from them by the Spaniards. These deposits are believed to stretch along the Piedmont region of the great South American Cordillera for hundreds of miles, constituting by this continuity one of the most extensive gold fields in the world. They have the same relative position to the Andes that our main gold belt has to the Sierra Nevada.

Nor are these hydraulic gravel banks confined to the countries mentioned. To whatever quarter of the globe we direct our attention, we fiod there this class of deposits of greater or iess magnitude. They reach with interruptions from equatorial Africa to Arctic Russia. They are present in Australia and probably also in that other great island continent, New Guloea. They are known to exist in Siberia, China and Japan, to say nothing of British Columbia, Alaska and other localities nearer home. What is left to these older countries of their former placers is now remuneratively worked by the contrivances and methods heretofore employed. Introduce there our California apparatus, and the output of gold would soon be greater there than ever before, and that this will be done in the early future admits of no doubt. In such wide distribution of the royal metal, there is lnsured for this industry a life as long, and a production as large, as await any other form of gold mining extant; and if hereafter, when in the new and distant fields into which his enterprise may carry or his fortunes cast him, the hydraulic miner shall find this article very helpful in the planning and construction of his plant, then will this writing have served its purpose, at least in part, and another of the aims of the Mining Bureau have been accomplished.

Some of the tabulated statistics including also certain other data contained ln this article have been taken from Bowie's Treatise on Hydraulic Miniog, a wnrk recognized by both the engineering profession and the practical miner as standard and authorative.

Terms and Phrases Used in Hydraulic Mining.—The business of hydraulic mining having during its formative stages been largely in the hands of men non-professional and little conversant wlth scientific nomenciature the names given to many of the structures, impiements and operations connected therewith were so lackiog in technical exactness as to require a little explanation. Some of them were unheard of, having been original in their conception or suggested by some mere incident—more often perhaps by the exigencies of the occasion. Though generally appropriate and nften highly expressive, certain of these terms to the unfamiliar ear may seem little better than barbarisms, which they really were at the time of their inception, though now, through long usage, they have come to be recognized as bnth legitimate and useful. The most of them have, in fact, been naturalized and admitted to the great republiic of letters, through their introduction into all modern dictionaries. And thus do ianguages grow, nur own having been much enlarged and somewhat enriched through the introduction of new or foreign words incident to the discovery and subsequent history of gold mining in California, these foreign wnrds having been mostly derived from the Spanish, from wbich tongue we have the terms bonanza, borrasca, stamped, batea, arrastra, etc. Besides these, which pertain to mining, our vocabulary has been much augmented by other words taken from the Spanish, some Welsh and German words of like purport having been engrafted on our Mother tongue. "Prospect," "prospector," "color," "show" and the like, though good English, are used by the miners in a sense different from that usually attached to them.

The "prospector" is one who goes out to search for mineral deposits of whatever kind. If successful in finding what he is after, the quantity so obtained is denominated a "prospect" or "show," meaning the showing such mineral substance makes. If the "prospect" consists of particles of free gold, small and few in number, the find ls styled a "color." Auriferous gravel in the parlance of the prospector is "dirt," and if rich enough to warrant being worked, "pay dirt." The term "grade," as understood on the Pacific coast, signifies usually a fall of 12 inches in 12 feet, the

*This article was prepared by the late Dr. De Groot for the Eleveoth Report of the State Mioeralogist, just issued; hut its publicatioo with that of much other valuable matter was prevented by the necessity of revisioo and omissioo, so that the volume might be reduced to reasooable limits. It covers familiar ground, hut is, on the whole, a complete and careful review of the iodustry aod hydraulic-mining methods. The article has heeo furoished this paper by State Mineralogist J. J. Crawford.

†It seems unoecessary to say that Dr. De Groot's article was writteo before the Camioetti act was put in practical operatioo.

latter being the length of the sinice box first here in use, hence this measnrement of grade. Terms pertaining specially to hydraulic mining will be explained hereafter, as they occnr in the text; though, while on this subject, it may be observed that the retention of the letter *k* in spelling the word *hydraulicing*, after the manner of most writers is not to be commended, snch use of this letter being wholly superfluous and contrary to modern nsage, it having ln all analogous cases been dropped by the American, if not also by most English lexicographers. Formerly the words hydranlick, mnsick, publick, etc., were all spelled after the manner here given, nor can we see any good reason why this letter should be dropped from the word in its verbal and be retained in its participial form, as this change alters it neither in sense nor sound.

To the washed gravel discharged from the miner's sluice or other gold-saving apparatus has been applied the term "tailings," hydraulic tailings being further distinguished as debris or detritns, the name "slickens" having also been sometimes given to this waste matter. This name being, however, both snperfluous and ontlandlsh, has come to be generally discarded.

How widely in meaning some of the words above alluded to differ, as employed by the miner and the man of science, is shown in the inch of water, which, as understood by the schooled hydraulic engineer, represents the quantity of that fluid which escapes per minute from a circular aperture one inch in dlameter, its center being 1½ lnches below a constant surface; whereas, the miner's inch of water, measured by the rule most in use in California, means the quantity of water that flows from an opening one inch square through a two-inch plank with a head six inches above the center of the orifice, the water being at rest. Different methods of measurement obtain, however, among the several water companies throughout the State, the quantity represented by a miner's lnch varying from 1800 to 2600 cubic feet per 24 hours' flow. These companles, acting in the start without concert or much theoretical knowledge on the subject, adopted each such system of measurement as seemed most convenient or as fancy might suggest, and, although efforts have been made to establish a uniform rule either by general consent or legislative enactment, this has not yet been effected.

The "duty" of the miner's inch, being the quantity of gravel it ls capable of breaking down and carrying off in the course of 24 hours, varies according to the character and condition of the material to be handled, grade of sluice, style of riffles, etc., ranging all the way from two to twenty cnbic yards, the average being about four.

The average in seven different localities in this State as estimated by the State Engineer, amounted to 3.6, as shown in the table appended:

Name of Stream.	Inches of Water Used in 24 hours.	Duty per Inch—Cubic yards.	Amount Moved—Cubic yards.
Table Monntain	833,250	3½	2,916,375
Butte Creek	24,000	3	84,000
Feather River	1,259,363	3½	4,407,770
Ynba River	5,468,171	3½	19,103,598
Bear River	1,117,082	3	3,351,246
Dry Creek	44,229	3	132,687
American River	1,914,500	4½	8,615,250
	10,650,596	3.6	38,610,926

The above result, 3.6, is somewhat below the general average in California, rendering it probable that the gravel run off in maklng these tests was coarse and heavy, if not cemented.

At the Hobson mine, Iowa Hill, Placer county, piping a bank of light gravel using 500 inches water, on usual sluice grade, and under a pressure of 360 feet, the duty of a mlners' lnch was found to be 24 cubic yards, elevatlng here the grade to 18 lnches and substituting iron riffles for the rock pavement. The duty was raised to 36 cubic yards, this experiment illustrating the gains due to the introduction of these new factors, the average result of the two trials being 30 cubic yards. Running on coarse bottom gravel, thls company under same conditions was able to move only ten cublc yards.

At the North Bloomfield mlne, Nevada county, handling 1,500,000 cublc yards top gravel, the duty of the inch was 5.39 cnbic yards, while running on the lower and more lndurated stratum, extending to a height of 65 feet above bedrock, the duty of the inch was reduced to 2.34 cubic yards, the miners' inch here being equal to 2.230 cubic feet.

THE work of preparation for the State mining exhibit is progressing eatisfactorily, though funds are eomewhat slow in coming in. But it is safe to eay that the exhibit will be altogether the best and most complete ever made. Space hae been assigned to counties in the mining exhibit as follows: Nevada county, 840 square feet; Amador, 464; Calaverae, 464; El Dorado, 420; Butte, 367½; Sierra, 348; Shaeta, 348; Plumas, 304½; Kern, 210; Tuolumne, 288; Siekiyou, 171; Contra Costa, 176; Inyo, 216; Mariposa 130; Merced, 75; Santa Cruz, 95; Santa Barbara, 95: San Diego, 90; Mono, 180; Mendocino, 22½; Lake, 57.

Cost and Profits of Good Roads.

Now that there ls an agitation throughout the State for better roads, and as at least one connty (Sacramento) has taken steps to carry through a bonding proposition for road buildlng, the following, which we glean from Eastern jonrnals, will show that similar ideas are being orged in the older States: It seems that in Monroe county, New York, road supervisors, connty commissioners and citizens were called together, and it was found that they could build an arterial system of county roads, radiating from the city in all directions to the bounds of the county, and connecting all considerable villages and towns with each other and with Rochester; that such a system could be built for just about one per cent of our valuation, which was then one hundred and thirty millions and is now one hundred and fifty, and for that amount—now one million, five hundred thousand—we could build a first-class telford road costing ten thousand a mile, to the extent of 150 miles. My idea was, said Mr. J. A. C. Wright of Rochester, that a board, composed by the supervisors, could, by filing a map in the county clerk's office, thereby make any road a county road; that they should secure a competent county engineer and should direct him to map out a system of county roads, which should include all the main roads of the county—first, for purposes of general care and repair; and, secondly, with a purpose of building these up into new-made telford roads, or as many of them as advisable, so soon as one such road was a success and approved. Such an idea was a revolution of our present system, and was a bold scheme, perhaps, in that we were unaccustomed to it, but one which would be found the most satisfactory and cheapest in the end. It showed that the cost of this system, 150 mlles even of good telford road, if carried at four per cent would be a charge of 40 cents per thousand of assessed valuation, being $2 per year upon a farm assessed as high as $5000, and only 40 cents per year upon the owner of a small house assessed at $1000 in the city.

Mr. Wright further stated that in hls opinion every county should build permanent roadways at an initial cost, bonded, but for the present merely to carry the indebtedness, and the increased valuation and wealth brought in would be sufficient to establish a sinking fund, which would ultimately wipe out the principal. When built these roads should be put in immediate, single systematic supervislon; divided into sections slmilar to railroad care and repair, but, unlike railroads, more elastic in the employment of local material and help. For example, the farmers could use the stone from their fields, their teams and their labor in the building, and when the roads were built an intelligent farmer could be selected as roadmaster of contiguous sections, his work telling when under the direction of an expert road-maker. In other words, the money raised by the community would be reimbursed to the community.

Major M. H. Crump of Bowling Green, Ky., speaks of the roads of that commonwealth, and he gives figures that are of the greatest interest and importance. I quote direct from him: "Kentucky, whlle it has some good roads, has many of the worst in the world, largely due to its miserable system of working them. Warren county, the seventh in the State in point of wealth, spends from $12,000 to $15,000 per year in labor and money on its roads and bridges. At least $10,000 of this is absolutely thrown away. There are mud holes with 500 yards of rock in them, now two feet under the mud. A road convention met in Lexington, December 20, 1892, which considered the Sims road bill, now before the Legislature, and which radlcally changed the old and inadequate system, as it permits the counties to levy a tax not exceeding 25 cents on $100, to be expended by a competent engineer, under the supervision of the fiscal court of the county.

"All roads are divided into three classes, and all work must be done by contract to the lowest and best bidder, and will be carefully inspected by the engineer in charge; all able-bodied delinquent tax-payers will be compelled to work out their taxes on the roads. By this law, and with the $15,000 now expended, seven and one-half miles of superior telford road can be built, at a cost not exceediog $2000 per mile, or 15 miles of good road at $1000 per mile

"In the last ten years I have constructed over $200,000 worth of telford and gravel roads, at the above fignres; and when good limestone can be had within one mile of the road, a sixteen-foot road with an elght-inch pavement and four inches of metal can be built easily. This includes everything, grading and all, on old roads, when the grades cannot be greatly chaoged.

"I usually estimate the cost of grading and shaping the roadbed (22 feet wide for a 16-foot roadway, and 24 for an 18-foot bed) at $200 to $500 per mile.

Telford paving costs per square rod:	
Stone paving eight inches deep, eight cubic yards put down at 50c	$4 00
Metal paving four inches deep, four cubic yards put down at 50c	2 00
	$6 00
18-foot roadbed:	
340 square rods per mile at $6	$2,040 00
Grading and shaping roadbed	200 00
	$2,240 00
(Laborers usually negroes, at $1 per day.)	
16-foot roadbed:	
310 square rods per mile at $6	$1,860 00
Grading, etc	200 00
	$2,060 00
Gravel roads, 16 feet, 2 inches ground	$1,000 00
Grading, etc	200 00
	$1,200 00

"Many miles of 18-foot stone roads have cost less than $2000 per mile. Many miles of 16-foot stone roads have cost less than $1600 per mile. These macadamized roads were constructed by county aid, $1000 per mile being allowed on each complete mile, when not less than three miles were assured. Bonds, thirty year, five per cent, sold at par and were taken by citizens of the county, so that not a dollar went beyond the limits of the county. Warren county has expended $60,000 in this way, and the county levy has been decreased every year since the roads were completed."

Sliokens.

THE Gold Poiot Gold and Silver Mining Company, at Grass Valley, bas selected the following Directors: Samoel Granger, James Watt, James Bennallack, F. S. Richards, A. B. Brady. The board organized by electing Samuel Granger, president; A. B. Brady, secretary; James Watt, treasurer; James Bennalack, snperintendent. The company has received a patent for the Helphine gronnd, and before loog work may be commenced on the Gold Point claim.

AT the aonual meeting of the Monnt Diablo Mining Company 38,626 shares of the capital stock of 50,000 shares were represented. The old Board of Directors was elected, consisting of George W. Grayson, J. M. Sbotwell, Captain J. N. Koowles, Lewis Teese, Jr., and R. W. Heath. J. M. Shotwell was elected president, Captain J. N. Knowles vice-president, R. W. Heath secretary, and Bank of California treasurer. The company has a cash balance of $6481.27 on haod.

THROUGHOUT Leadville, Colo., district there is quite a noticeable display of activity despite the nnfavorable conditions that confront the mining industry. This is to be accounted for in a very large measore to the stimolus exerted by the resnlt of the development of the gold properties in the district. In the vicinity of the American smelter a mill is in process of erection for the treatment of gold ore by the cyanide process, the intention being to make a specialty of Cripple Creek ore.

THE principal mines of the State are asked to dooate not less than three tons of ore eacb, to be crushed in the five-stamp mills which are to be operated in the mining exhibit during the continuance to the Midwioter Fair. As each lot of ore is being croshed and redoced an annonncement will be conspicnously posted, informing visitors whose rock is being operated npon and the result of the milling. The product of the operations will be added, as has been previously annonoced, to the mining exbibit fond.

THE following were elected trnstees at the receot annoal meeting of the Kennedy Mining Compaoy: John Barton (president), D. E. Hayes (vice-president), John Taylor, F. Reichling, and W. W. Belshaw; L. F. Reicbling was chosen secretary and J. F. Parks snperintendent. For the fiscal year eoding November 30, 1893, the mine yielded 35,668 tons of ore. The face valne of the gold bullion after paying cost of assay and express charges to San Francisco was $645,552. Dividends of $460,000 were paid. The company has a 40-stamp mill, and the mine is in Amador connty, California.

HAMILTON SMITH, mining engineer, has recsotly sobmitted a report of his operation of the Alaska-Treadwell mioe for the first five months of the cnrrent fiscal year, say from April 1st to October 31st, doring which intsrval 100,502 tons ore was crushed, yielding $356,227. The expenses for that period were $122,227, leaving a profit of $234,000, against $168,477 for the corresponding period last year and $180,708 in 1891. On May 15th the soperintendent estimated that there was 1,768,000 toos of average ore in sight above the 110-foot level, besides a large quantity of poorer ore. In the coming year, it is proposed to open a level at 220 feet, when a furtber large body of ore is expected to be exposed.

SUIT has been begun at Pbœnix, Arizons, to contest the ownership of the Mammoth mioe on the ground of priority of location. The plaintiffs are A. B. Coosor and otbers, local mining men. The defendants are the present owners, C. L. Hall of Denver, Dennis Sullivan of Leadville and Henry McCrea of Washington, D. C. The location was made by the plaintiffs of the Big Four mining claim in September, 1892, and the location of the Mammotb is alleged by the plaintiffs to be the same as the Big Four, made two months later. The present owners of the Mammoth bought the claim from the original locators last Jnne for $30,000, and within the past month are said to have refused an offer of $750,000. The result of the suit is awaited with great interest, as nomerous other claims in the same district are likely to come into litigation.

REPORTS from the Integral qnicksilver mine, Trinity county (recently described at length in this paper) are that the preparations for more extensive development are practically completed, and the main shaft is being sunk at a rapid rate. The surface works are in operation, the pomps going and the new furnace will be started about Febroary 1st. Among other things a track has been laid from the lower tonnel to the bunkers, about 400 feet, and it has been completely covered over, so that operations will not be interrupted by snow. The Integral Company has provided comfortable qnarters for its men, and a postoffice has been established at Integral. Ample snpplies are on hand for the winter. It is expected that the fornace capacity will be increased to keep np with the most speedy development of the mine consistent with circnmstances. A fine specimen of ore from this mine is to be seen at the store of Miller, Sloss & Scott, 12-14 Pioe street, San Francisco.

Scientific Progress.

Man's Place in Nature.

President David Starr Jordan of the Stanford University lectured last week at Golden Gate hall in this city on "Man's Place in Nature." "Huxley's essay, published 15 years ago, really tells all that the scientists of to-day know," said the speaker. "No positive new light has been thrown on the subject since then. The study of heredity has been taken up to a great extent, scientists preferring to work upon something which will give results, of which the study of man's origin has not been particularly productive. Homology is the stamp of heredity, and the nearness of blood relationship is proportioned to the closeness of homology.

"At one time, when teaching in an Eastern medical college, an alligator from Florida was given me to dissect for the students. They crowded around, all expectant as I dissected the beast, anticipating the sight of some unusual internal organs. But none of any marked prominence were found. The students had to look most carefully to notice a slight difference in the heart and diaphragm of the alligator to those of a human being. Homology has but one explanation. We believe we are all descended from the common stock, and have but one reason for believing so. By the law of continuity, if in 19,999,999 species of life homology means blood relationship, it must indicate the same in all other cases.

"Darwin concluded that if each species arises through natural law by processes of orderly change, then man must have thus arisen. The homology of man with the ape family indicates common heredity. Hence both man and apes are from some simian stock; not the same as any apes now living, for all show marks of divergence, but from some stock that we could call monkeys; a stock, according to Darwin, that were arboreal, hairy, long-armed and had moving, pointed ears. On this latter peculiarity there exist at this day men who can move their ears in a like manner to Darwin's prehistoric man-ape. Darwin thought also that man at one time had a tail, and the latter-day theory is that human beings still have tails, which have shrunk away so as not to project beyond the skin. The question as to what has become of the tail is one of later development, but as many monkeys were and are tailless, argument is productive of nothing.

"A group of man primates may be said to be composed of lemurs or semi-apes, new world monkeys, old world monkeys and man. In general structures man goes with the old world monkeys. One great authority so grouped the higher order of mammals, and took the stand that the orang-outang was more akin to man than the common monkey. The lemurs or semi-apes were monkeys without any of the mischievous or cunning habits of the latter-day monkey. In special development lies the great hiatus between lemurs and apes. Another division apparent is the low or high brain capacity of the lemurs as against that of man and the new world monkeys. In the lemurs it was wholly undeveloped. Man goes with higher forms, as an old world ape. If we were not a prejudiced party, and not our own classifiers, we would not hesitate in acknowledging our brotherhood to these creatures.

"Now touching upon an attempt to separate man as a group from other primates: The difference in structural distinctions is slight. In the embryo man and all animals the tail is just alike. The hair—extremely specialized in higher races. Some are well covered, all monkeys are so, and the hair cells on our bodies are the same as those of monkeys. Toes—monkeys have used their great toe as a finger for climbing, and that member has always showed out prominently. In an Asiatic race at this day the great toes stand out larger than the others. Attitude—that of man becomes more erect, but the apes still shamble and shuffle along. The jaw—that of the larger apes is greater than the human jaw, but in the smaller monkeys there is not so great a difference. The prominence of the eyebrows goes with the development of the jaw, and skulls of the larger apes have been obtained the eyebrows on which were plainly visible looking on the back of the skull. The brain in normal man is much larger than in the normal ape. The brain of man is growing. Admitedly so. Then on that admission we must allow that original man's brain was no bigger than an ape's. A big monkey's brain of this age will compare very favorably with that of some pigmy men of Africa.

"Mental differences, speech—All races of man have some forms of speech. The higher animals sing, roar, growl or emit noise. As to a monkey's speech, we must wait till the result of Professor Garner's investigations are all known. Garner insists that apes can talk and that he can follow their speech, and until evidence to the contrary is forthcoming his statement must stand.

"The use of tools—The most primitive man knew the use at least of flints for producing fire; monkeys have not been known to use flints or any tools to prepare anything. They may sometimes use an article for some visible purpose, such as to throw a tool, but no more. Affection—The possession of it by man needs no reference to. Apes show affection by jealousy, and Rudyard Kipling, in a true story, describes the exhibition of a tragic power in a monkey's affection. The intelligence shown by an ape is that of a narrow-minded, short-sighted old man.

"My own belief is that man was a nomadic ape, but not hairy-tailed. That man's body came from the lower ape forms is likely, but the intellect had an introduction quite separate." The professor concluded his lecture by quoting the closing paragraphs of Darwin's well-known "Descent of Man."

Whence the Water of the Great Lakes.

Where do the waters of Lake Michigan come from? is an old question, and it is a question as old as the artesian wells, says the Chicago *Herald*. Where do their waters come from? Colonel Foster, an eminent civil engineer, for many years in charge of Government interests on the lake, was fond of talking on the first subject. "Every drop of those waters," he was often heard to declare, "came from the Rocky mountains." His theory was that they were brought here subterraneously, but he never, to our knowledge, marked out the course of the subterranean stream.

He announced that as his conviction long before—indeed, he died before—the sinking of artesian wells in Chicago, and the consequent discovery of the now undoubted fact.

William B. Ogden held the same view, and used at times to make himself very interesting in expatiating upon it. With him, as well as with Colonel Foster, it was no more than a theory, but he adhered to it firmly.

Mr. Cregier, who is scientific before he is a politician, is wont to talk approvingly of the theory in a manner to convince any man.

The phenomenon is the running out of this lake through the others of the easterly chain and over Niagara Falls of an incalculable quantity of water, and this continually every minute in the hour, every hour in the day, every day in the year, and every year in progressive time!

The lake has no visible inlets; where, then, does it get its replenishment? From the Rocky mountains.

Through rents and crevices, down into caverns at the roots of these mountains, pour ever the waters from melting snow. Four thousand feet they sink to strike a gravity incline that levels with their floor under Chicago.

Under this city and elsewhere on the west side of Lake Michigan this is the proved theory, theory as good as proved—the snow-covered Rocky mountains are constantly sending their waters to supply flowage and evaporation that is ever going forward in the watery expanse.

Ocular Aperture.

It has been remarked by an authority on the use of the rifle that persons whose eyes have small pupils usually make the best shots, says the *Optician*. And in riflemen's "orthoptics," as is well known, we meet with a practical recognition of the same idea. It leads to the inference that, owing to the automatic adjustment of the iris, there must be more certainty in aiming at a small dark object against a light background than *vice versa*. Passing for a moment to the matter of telescopic gunsights, we may observe with what facility the advantages of such could be obtained by means of the compound spectacles or eyeglasses. There is one point worth noticing here, which is the greater perfection with which glasses for looking at distant objects only can be corrected—the angle of view being so small that, for the front lenses, the rays are practically parallel. Of course vision is always best in the optical axis of a spectacle lens, and this must be borne in mind in the case of riflemen who wear spectacles habitually. Their orthoptic discs should be so constructed as to be fixed rigidly to the spectacle frame, between the glass lens and the eye.

Mechanical Progress.

Effect of Temperature on Iron.

An official report of the tests recently made at the arsenal at Springfield to ascertain the effect of temperature on the strength of iron has appeared, says the *Manufacturers' Gazette*. The specimens were heated by rows of Bunsen burners, which were arranged in a muffle, and the temperature of the test specimens were judged by their observed expansions. Each piece was heated to the temperature of the test before being strained, and its expansion determined by a micrometer, and the coefficient of each grade of metal having been determined before the tests began the temperature could be inferred with considerable precision.

An abstract of five of these tests—the temperatures being all on the Fahrenheit scale—is in evidence that the strength of steel is greater at about 500° than it is at 70°. These five series of tests were made with five different qualities of steel, containing respectively .09, .20, .31, .37 and .51 per cent of carbon, and the percentage of strength was obtained by dividing the tensile strength of a sample of steel at the given temperature by the strength of the same quality of steel at 70°. The result presents the interesting fact that the specimens in question were all stronger in the neighborhood of zero than they were at ordinary temperatures—all of them, in fact, showing a minimum of strength at 210° or thereabouts, and a maximum of strength at about 550°.

To Save Rails.

The latest practice in the economy of rolling stock on railways is to turn the cars at the end of each trip, whereby a large percentage of extra wear and tear is saved, says *Iron Age*. Some years ago a portion of the Wabash railroad was laid with old English iron rails and a small part with steel rails from the Carnegie mills. It became necessary after a time to remove some of the main line rails to another part of the road, and it was observed that after relaying them many gave out immediately, while others manifested no signs of wear. To determine the reason of this apparently unaccountable condition, an investigation was ordered, which showed that the road from which the rails had been removed was built in a northwest-southeast direction, and that, in relaying, a large number had been turned end for end. Those that had not been so placed exhibited no additional loss by attrition, while the turned rails succumbed in from 30 to 90 days. The conclusion arrived at was that the metal had become polarized from long use, when first laid, and that the fiber was broken up by the traffic in the opposite direction. It was further proved that cast-iron wheels generally yielded twice the mileage when the cars were turned at each end of the journey than when they were run backward and forward without reversing. Notwithstanding the value of this discovery, it was not universally utilized, and it is only recently that some of the American railroads have begun to recogoize its importance.

Smoke Combustion.

In operation in the power plant of the Laocashire (England) *Evening Post* there is a new system of smoke combustion. The apparatus is fitted in a furnace having bars four feet long. The height from the bars to the top of the furnace is 15 inches. About seven inches from the far ends of the bars an arch is placed five inches deep. By means of this arch the smoke is turned downward, upon and through the fire. Below the bars a door is placed about three feet from the front, whereby the amount of draught allowed at the back of the furnace is regulated, and a more equal proportion forced up the front. By this door the bars are kept cool, owing to the additional quantity of air, and thus preserved, and the air is thoroughly mixed with the smoke as it passes through the fire, thereby assisting in its combustion. It is estimated that by the use of this system a saving of over 25 per cent has been effected. The quantity of smoke has been greatly reduced, and the residue from the furnace in the shape of clinkers has been reduced 50 per cent. While this does not wholly dispense with the smoke difficulty it is a long step in the right direction.

A New Self-Oiling Box.

Something new in a self-oiling box has been brought out by a Pawtucket inventor. The device prevents the oil from running out on the shaft, and in this feature would prove valuable in weaving mills where the dropping oil is liable to spoil goods.

Another feature of this box is the manner in which the oil is transferred from the reservoir to the shaft, making it impossible for the felt or wicking to glaze over and become useless, as is often the case after a few months' run. Then, too, the box is a labor saver, in that it runs a long time without refilling; all dust is kept out, and the oil continually in motion does not thicken.

The oiler does not have to keep climbing up to the shaft to see how nearly empty the box is, or to put in more oil, which may run over and down on the floor, for the oil reservoir has a chamber in which is an indicator plainly visible from the floor, so that the oiler may pass along the line at a fast walk and tell exactly in what condition all the boxes are.

New Use for Bronze.

It is well known that the bronze made of nine parts of copper and one of aluminum is of the color of gold and will not tarnish. It is of tensile strength equal to steel. At this time this metal can be produced in castings for about the same price that crucible steel costs, and the castings can be made very true to pattern. Why do we not use it and save the expense of working to shape? asks the *Journal of Commerce*. And why do we not use it for the improved artistic effect its color will give?

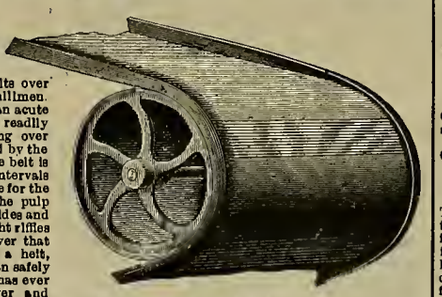
Perforated Sheet Metals, Steel, Russia Iron, American Planish, Zinc, Copper and Brass Screens for all uses.
MINING SCREENS A SPECIALTY.
221 & 223 First St., San Francisco.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.
H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

The Explorers' and Assayers' Companion.
A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

PLACER AMALGAMATORS

Useful Information.

Treatment of the Foot of the Horse.

The importance of the frog should be known to every horseman, says the *Rider and Driver*. It should never be touched with a knife, as it breaks the jar to the coffin joint in coming in contact with the ground, and from its elasticity it allows natural expansion—this being the great function of the frog when the horse is in motion. But if the shoe is so constructed that it closely fits each side of the frog, then the iron shoe controls the elasticity of the foot, and so induces the first step in contraction. So the shoe, properly applied, should follow the gradual curvature of the wall of the foot, taking care to give the frog plenty of room to perform the functions already indicated.

The horse should be shod once a month, and when shod very little alteration is necessary on the foot. The rasp is the only tool necessary to be used. The scooping out of the sole of the foot with the knife, or mutilating the frog in any form, should be carefully avoided; and owners and blacksmiths, if they observe these hints, will find in consequence less lameness connected with the horse.

When horses first become feverish, the simple remedy is just to stand them in mud—yellow clay—up to the fetlocks. This reduces all local inflammation.

The treatment for thrush in the frog of the foot is quite simple. The foot should be poulticed with flaxseed meal for twenty-four hours. This treatment softens the parts and reduces the inflammation. A dressing of fine tar and oakum should be applied. This is all that is necessary to complete the cure.

The remedy for scratches I give for the benefit of the horse. It is to apply simple white lead with a painter's brush—and nothing else. No surer remedy has ever been suggested. All that is necessary is to continue the treatment till cure is effected, which will occur in from six to seven days.

Corns in the foot of the horse should never be cut out, as by this means support is taken away from the wall of the foot and a receptacle is created for the lodgment of dust and gravel, which are very penetrating and may cause separation to take place between the wall and the sole. The part of the heel affected with the corn should be lowered and a side-calk put on the shoe, thus relieving the part from pressure and keeping the foot soft. The attainment of this result is all that is required. It may be accomplished more readily by using a wet swab or by poulticing.

Horses foraging should be shod light in front and never behind.

Horses that interfere should be thoroughly examined in regard to position of the foot on the ground. If low on the inside, they should be raised from the point of the toe to the heel, thus widening their gait. This mode of treatment will effect a cure, except in cases of abnormal construction or bulld.

The Cure of Colds.

The season of colds is here. People are always complaining about sore throats, about colds in the head which are started from the throat, or live in constant dread of specific throat affections, such as quinsy or diphtheria. It is due to the unnatural habit of eating most forms of food and drinking many sorts of drinks in an excessively hot state. Many men would get in a towering passion if the soup at dinner was anything below scalding heat, and many women would feel that their tea was not worth drinking if it had got down to anything like the heat of the body, says the New York *Commercial Advertiser*.

It is quite easy to illustrate the sensitive nature of the back of the throat. If a soft cloth be dipped in cold water and applied to the abdomen for a short time it will at once be seen that the delicate rosy tint of the lining at the back of the throat has changed to a deeper red, and if the cold application be retained sufficiently long in its position by dropping on iced water this red color will still further deepen, till distinct inflammatory symptoms will appear; these can be removed by substituting a warm poultice for the cold application, and the throat will regain its normal color if a definite inflammatory stage has not been reached.

This illustrates very well the mode of treatment which should be used in cases of inflammation of the throat—that is to say, that warm applications, such as poultices or fomentations, should be applied to other parts of the body and especially to the abdominal region. When the throat has been weakened by the use of bot foods, inflammatory symptoms are very often caused by a chill to the front of the body. Ulcerations of the throat are very often caused by drinking impure water. The utmost care should be taken to see that all water be boiled before it is used, or that it be taken in that peculiarly valuable state, namely, the juice of fresh ripe fruit.

Another cause of throat trouble is the presence of carious teeth, for we not infrequently find that some of the diseased matter proceeding from them lodges in the folds of the membrane lying in the throat, and there sets up an irritation which may develop into a serious sore throat.

The last point to mention is the value of oils and fats for the throat. Their effect is not wholly understood, but that they have a very soothing one in case of irritation, and a strengthening one in case of illness, is beyond a doubt.

One of the best forms to take oil is to drop a little fine olive oil on the back of the throat when the head is held back, and then allow it to find its way down by repeated swallowings. Half a spoonful taken in this way three times a day has often a most wonderful effect in strengthening the throat, in putting an end to that rough tickling which is so distressing a cause of cough and in generally soothing the organs with which it comes in contact.

Increasing Use of Spectacles.

A writer in the *Atlantic Monthly* for November argues very clearly that eyesight is not steadily tending to the bad. This writer on spectacles tells us that the present-day common use of spectacles is entirely due to modern science. In former times young people with defective eyesight were not aided simply because they were young. Spectacles were for aging or elderly people. The consequence was that many young people received permanent injury or loss of eyesight because it was assumed that tender years and wearing of glasses were incompatible. There is no doubt that the great advances made during recent years in sight-testing, and the reduced price at which good spectacles can be vended, have done much to popularize the use of aids to vision.

To Cut Stone.

A circular saw which is claimed to cut stone with remarkable efficiency has been invented in France. Its edge is set with black diamonds in the same way as the straight blades; but as the strain on the diamonds is all in one direction, the setting may be made much firmer. This is a good invention, says the Chicago *Journal of Commerce*, but, before it was devised in France, a similar saw was invented in America, as far back as 1865, by E. S. Drake, who, in the March of that year, patented "a stone-cutting circular saw with black diamond teeth."

Inequality of Vision.

According to a German doctor, who has just published the results of a long course of experiments on this subject, the sight is rarely alike in both eyes. He finds that only in one case out of fifteen are both eyes in good condition. In seven cases out of ten one eye is stronger than the other. In two cases out of five, patients are affected with astigmatism, which may be defined as an imperfect focusing of the light rays entering the eyes. This usually arises from a difference in the curvature of the cornea, or transparent portion of the front of the eye. Nearly 50 per cent possess only imperfect appreciation of colors.

Electricity.

An Interesting Experiment.

M. Blondlot has been experimenting in an interesting line of electrics. He describes some experiments which he undertook to determine the rapidity of propagation of an electric disturbance along a copper wire by means of a method independent of theory. With lines of unequal length he found that the results were so nearly alike as to show that the propagation movement is tolerable uniform. In two lines, of 1115 and 1973 yards, respectively, he discovered speeds of 183⅛ and 183¾ miles per second. Unfortunately M. Blondlot's method of arriving at these results is not given, adds the Chicago *Journal of Commerce*, but it is interesting to know that they correspond perfectly with those be had previously obtained by another method. It is also stated that these experiments have had the advantage of being independent not only of theory, but also even of the existence of electromagnetic oscillations and undulations.

Artificial Sunlight.

In a dark room with alternating currents of 800,000 voltage, Nicola Tesla, by means of atmospheric vibrations, caused a faint glow of light to appear. Explaining the phenomena, he said: "If I can increase the atmospheric vibrations, say one million or ten thousand millions, I can produce sunlight in this room. Of course I can increase the vibrations by increasing the voltage. I can make the voltage 8,000,000 as easily as 800,000, but I am not ready to handle 8,000,000 volts of electricity. Currents of such strength would kill everybody in the room. I expect, however, to learn how to control a large voltage. When I have increased the atmospheric vibrations, perhaps a thousand times, the phenomena will be no longer electricity. It will be light. I am satisfied that sunlight can be made from electricity without doing harm to anybody, and I expect to discover how it is done."

Oil vs. Electricity.

It is stated that in foggy weather the electric light is not nearly so effective as a lighthouse illuminant as gas or oil. The commissioners of Irish lights are seeking the statutory sanction of the Board of Trade for the adoption of the electric light as a fixed light at the Old Head of Kinsale, says *Invention*. Local feeling, however, is opposed to the proposal, and a quantity of evidence has been obtained, chiefly from shipmasters, including Captain J. T. Bragg, adviser to the Liverpool Steamship Owners' Association, all of which, we are informed, condemns the electric light as of little or no use under hazy conditions of the weather. The most powerful light of the kind is that of St. Catherine's Point, Isle of Wight, and the stranding of the Eider well within the zone of this light is regarded as a lamentable proof of its efficiency in fog.

A New Mining Lamp.

A newly-invented electric mining lamp is called the Sussman lamp for its battery. The affair is 2¾ inches square by eight inches high, and weighs less than four pounds. One charging of the battery assures a clear and brilliant light for 14 or 15 hours. The cost of maintaining the lamp does not exceed that of a kerosene lamp. The battery is of the dry type, and thus there are no fluids to overflow and destroy the connections, as is sometimes the case with portable electric lamps.

To Measure Lightning.

A novel apparatus has been devised by Messrs. Siemens & Halske for registering the number of times that lightning has passed through a circuit. It consists of an iron bar placed near but slightly oblique to the line, and pivoted like a compass needle, so as to allow it to turn through a small angle; an abnormal current in the wire will tend to place this iron bar perpendicular to the wire; this motion is limited to a small amount by two stops, and, by means of a pawl and rachet, operates an indicator hand, which, for each motion of the bar, advances one mark on a circular dial. The iron bar returns to its original position on the cessation of the abnormal current.

Too Loud a "Ticker."

It was recently reported in the London *Daily Telegraph* that the parish church at Chesterfield has a telephone with 40 or 50 subscribers. The pulpit transmitter was at one time placed underneath a cushion covering the stone top, a circular piece being cut out of the cushion for the purpose. A strange preacher, not being aware of its existence, put his watch in the circular aperture, thinking it to be a receptacle designed for such use. Next day persons who listened to him through the telephone said they had heard him very well, but thought he must have been wearing a very loud "ticker," as it made quite as much sound as he did himself.

It Helps Germination.

Prof. R. Chodat describes an investigation into the action of electric light on vegetation, in which he demonstrated that electric illumination exercises a favorable influence on the germination of seeds. He confirms G. Bonnier's statements that the effect of this kind of light on herbaceous plants promotes the lengthening of the stems and leaves. Under glass the light greatly accelerates growth and causes the green parts of the plants to assume a more intensely green tint. The structure is at first strongly differentiated, but prolonged exposure acts in this direction with a deleterious effect.

A New Look.

A novel electric lock has been invented especially for use on windows, which, by means of this device, may be left open one or two inches for ventilation, and be quite as secure as when completely closed. The lock operates with ease by simply pressing a button, and can readily be connected with the fire or police alarm service, so that any unwarranted tampering with the window or mechanism will be immediately followed by a report at the fire or police station.

FOR SALE!

A Three-Fourths Interest in a Group of Gold Quartz Mines,

Partly developed. Price low. Cash payment required, $1000; balance on 100 days option. Address "CALIFORNIA," Mining and Scientific Press.

J. F. CROSETT,
628 Sacramento St., San Francisco, Cal.
Gold Mines Bought and Sold on Commission. Five first class meritorious mines now for sale at from $25,000 to $300,000. Correspondence solicited.

LIGHTNING LARGEST **WELL MACHINERY** Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

INVENTORS, TAKE NOTICE!
L. PETERSON, MODEL MAKER,
226 Market St., N. E. cor. Front (up stairs) San Francisco. Experimental machinery and all kinds of models. Tin. and brasswork. All communications STRICTLY CONFIDENTIAL.

THE GRIFFIN MILL.

A perfect pulverizer of all refractory substancee by either the wet or dry proceee. It worke better and at leee expenee than any other Mill, and ie conceded to be the only perfect pulverizing Mill Manufactured.

THE McGLEW ORE CONCENTRATOR COMPANY.

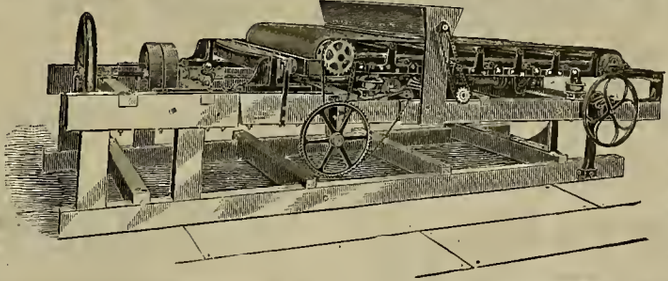
{ PATENTED Sept. 19, 1893. } CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. { FRANK BARRERE, Secretary and Manager. }

CAN BE SEEN IN OPERATION AT THE PACIFIC BRANCH UNION IRON WORKS, 127 FIRST STREET, SAN FRANCISCO.....OFFICE, 116 DAVIS STREET

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt. SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION. CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE (at present).....$350 EACH,
Including Prepared Canvas Belt.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent.

The concentrator runs very easy and requires but slight attention. One man attends to rock-breaker, crusher and concentrator. You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

MINE BELL SIGNALS

ADOPTED, USED AND IN FORCE IN ACCORDANCE WITH STATE LAW.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12x36 INCHES, THE MINE BELL SIGNALS AND RULES provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used In All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth, so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Coast Industrial Notes.

—Cove, Or., is shipping quantities of apples East.

—The Pacific Union Club, San Francisco, may erect a new building to cost $300,000.

—Judge Fulleton of the Oregon Circuit Court has set aside the recent sale of the Oregon Pacific.

—The San Francisco Bridge Company of this city has assigned, with liabilities of $200,000; assets, $500,000.

—Seamen for coasting vessels in the coal trade must be content with $25 a month. The cut was announced last week.

—All efforts to save the steamer City of New York, wrecked off San Francisco harbor, have been abandoned.

—The Southern Pacific Railroad Company is shipping from about Castle Crags a rock that forms a fine cement pavement. Carloads are left daily at Lincoln.

—The steamer Leader, which collided with the steamer J. D. Peters about two weeks ago, has been raised successfully from the San Joaquin river, the barges Atlas and Victor being used as a pontoon.

—A number of new men have been put to work learning the trade of gripman within the past month on the Market street system, and not a few of the older hands have been dismissed for one cause or another.

—Wheat charters to Great Britain are quoted in Portland, Or., and Puget sound ports at 33s to 33s 9d., while here charters range 1os lower. The difference in the rates has led the owners of one or two idle vessels to charter up north and send the ships in ballast where they could load grain.

—Captain Cox of the Sealer's Association, who was recently in England, says the question now is as to how rigidly will the Paris regulations be enforced, as there is no movement to modify them. The prospects for the higher-priced skins is very blue indeed. Vessel owners, though fitting out, scarcely know what to do with their vessels.

—Mayor Ellert has filed a petition for an injunction against the Market-street Railway Company, operating the Mission-street line. The prayer of the complaint is based upon the knowledge that the defendant company is about to construct an overhead wire (trolley) system for the purpose of operating the Mission-street line.

—Since Rogue river, in Oregon, has regained its normal stage of water, a deep channel is being cut straight out to sea, while the north spit has moved out to sea fully half a mile. At low tide a low spit can be seen reaching out from the McCormack rock in a semicircle to the mouth of the river, half a mile farther out than the former spit, and where the mouth of the river formerly was is now dead water.

—McPhee & Grallere were lowest among the list of bids opened recently by the supervising architect at the Treasurer's office for constructing the mail platform, inclosure and approaches to the new postoffice building at Sacramento. Their bid was $3974. The other bids were: Kreusberger & Harvie, Sacramento, $4363; Silas Carle, Sacramento, $5079; Carlin Bros., Sacramento, $4078; McKay & McCann, San Francisco, $5240.

—The trustees of the Whittier State School recently opened bids for the construction of two buildings for the girls' department. There were 36 bids. Stephens & Myers were awarded the contract for plumbing and steam heating; Mackay & Young, the contract for carpentering, plastering, iron and brick work; The Globe Cornice Works, galvanized-iron work; E. E. Peck, electric work; Stumpf & Spence, painting. It is expected that the buildings will be completed June 1st.

—On January 1st a new schedule of wages will go into effect in the Mare Island Navy Yard. The Board of Wages, after investigating the wages paid in San Francisco, prepared a new schedule which involves a big cut. The recommendations of the board were sent to Washington, and a telegram received to-day announces that Secretary Herbert will approve the board's action. The decrease amounts to from 24 to 56 cents per day. Laborers are not affected. In a few instances there will be a slight increase, but every man that is a mechanic will get less pay.

—A very important suit has been commenced in the United States Court at Los Angeles by the Crystal Springs Water Company against the city of Los Angeles. This will settle the question as to whether the city owns the water in the Los Angeles river or whether the company does, and includes as well the point as to the ownership of water which percolates through the bed of a river and is drawn off by means of wells sunk below the bottom of the river but at some distance from it. On the outcome of the case depends the possibility of the city constructing and owning its own water works.

—Recently good news was brought to town by Sam Todd and Tom Wood, says the Alturas *Herald*. While out prospecting about two miles this side of Cedarville, in Cedar pass, they discovered a six-inch vein of coal that could be traced some distance. Samples of the coal were tested by George Armstrong, the blacksmith, and were pronounced by him as being of excellent quality. It burned just the same in the forge as the coal he uses from the city, and he had no trouble in obtaining enough heat from it to weld iron. The discoverers have filed their location papers and will return in a few days and prospect the vein to find out if it increases in size and quality as depth is reached.

—The Southern Pacific earnings for 1893 will make a gratifying showing. In 1892 the gross earnings amounted to $48,972,000 and the operating expenses were $31,288,000, giving the net result of $17,684,000 to the good. The operating expenses for this year will aggregate about the same as last year, and though the officers of the company admit that they look for a slight decrease in the net earnings they think the falling off this year will be very slight. The difference will certainly be smaller proportionately than was shown at the end of October in this year, for the reason that the November and December receipts were much in excess of the receipts of those months last year.

—The State Treasury is rapidly being filled with gold received from the counties of the State on account of the first installment of taxes. The counties that have settled so far, together with the amounts, are as follows:

Placer	$40,388 11	Yolo	$83,019 02
Tehama	43,336 12	Plumas	9,674 50
Solano	89 678 29	Lake	18,377 00
Napa	63 450 01	Humboldt	78,019 55
Orange	38,301 26	Siskiyou	27,104 38
Glenn	44,515 04	Trinity	5,674 60
El Dorado	17,849 55	Tuolumne	13,779 40
Madera	20,646 38		
Nevada	14 083 15	Total	$607,596 36

—Fire in "Printer's Row," San Francisco, Monday, Dec. 25th, caused the following losses:

Francis, Valentine & Co.	$100,000
E. J. Shattuck & Co.	10,000
E. W. Goggin	4,000
Commercial Steam Power Company	5,000
Blake, Moffatt & Towne	20,000
Edward Bosqui	45 000
Paul Brunotte	500
Mysell & Rollins	1,000
Losses on buildings	30,000
Losses on cuts, papers, etc., in Francis, Valentine & Co's	10,000
Call and Bulletin	5,000
Total	$230,500

All are covered by insurance except Francis, Valentine & Co., who have $22,000.

—The first circular giving information touching the Southern Pacific Company's new freight tariff has been issued, showing a marked reduction in the rates to be charged to shippers in this State and on this coast after the first of next month. The circular just issued covers only a limited ground, being selections from a list of some hundred grocery articles, drawn up by the Southern Pacific Company, showing the difference in rates between the present tariff and the new, from San Francisco and Sacramento to Fresno, Bakersfield, Maricopa and points in Arizona on the Southern Pacific main line; to Chico, Tehama, Red Bluff, Redding, Delta, Sissons, Montague, etc., on the Oregon main line; and Auburn, Reno, Winnemucca, etc., on the Central main line. In many instances the rates show a reduction of from 20 to 33⅓ per cent and as low as 50 per cent, but the average will be about 10 per cent.

—The California and Nevada Southern railroad will reach Iron county in southern Utah in four and one-half or five months. The line is being pushed right along. It will connect with the Rio Grande Western at Provo. This line will give Utah a direct route to southern California, and by next July it is expected that a through train will be run between Ogden and Los Angeles. The new line starts from a point 100 miles north of Goff, Cal., on the Atlantic and Pacific, and extends through southern Nevada to Iron county, Utah, where the company owns coal and iron properties, there to connect with an extended line from the Rio Grande Western. There is unlimited capital behind this road, and the track will be constructed so as to make it a fast and safe line. The grade will not exceed 1½ per cent anywhere, notwithstanding the rough country through which it passes. Already $600,000 has been expended for engineering work alone.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE IVANHOE.—Plymouth cor. *Dispatch*, Dec. 21: The above-mentioned mine is owned and operated by a company of four young men, born and raised in this immediate vicinity. Any one visiting the Ivanhoe mine to-day will find there a shaft down 100 feet, with a tonnel or drift on the 90-foot level running north on the ledge 20 feet and another running south on the ledge 25 feet, and a steem engine of a 12-horse power capacity, used for hoisting. A well-equipped blacksmith shop and a five-stamp mill, run by water power.

The ore pays $4.50 in free gold milling test, the sulphurets assay $50 per ton, with an eight-foot ledge in the bottom of the shaft and a ten-foot ledge in each tunnel or drift. The present owners of this fine piece of mining property will continue to sink 100 feet deeper on the beginning of the new year. At present they are working, taking out and milling $4.50 rock from the tunnel above mentioned, more for the purpose of prospecting the ledge than otherwise, and being satisfied and convinced that they have a mine, hence sinking another 100 feet will be the next move, after which they again intend to drift both north and south on the ledge. The rock in the shaft at present is $4.50, the same as in the drifts.

Superintendent Jones informs your reporter that the "bolkhead" in the Bay State tunnel is completed, and that sinking will commence on the 20th inst., and will be pushed along as speedily as possible.

AT THE FARRELL.—Amador *Ledger*, Dec. 23: The improvements at the Farrell mine have grown till the bank of the river at that point is dotted with new buildings, including a mill, an office, a boarding-house, sleeping apartments and all the necessary constructions connected with a well-appointed mine. The work is in charge of R. Wise, one of the chief owners of the property. The mill was started Wednesday upon heavily sulphuretted rock, which assayed $10 per ton. The development of this mine has proved beyond a preadventure of a doubt that it is located on the Gwinn mine ledge. Many good miners who worked in that property say the formations are precisely alike and that the ore is identical in character. During the prospecting work that has been done since the present people have had charge of the property, an abundance of rock has been uncovered, ample being now in sight to run the mill for many months. They get their power from the Blue Lakes ditch, which carries water to the hill above their mill, the fall being ample for all purposes.

Butte.

AT FORRESTOWN.—*New Era*: A. B. Birmingham and Max Bills are developing a quartz ledge near Lumpkin. They have a four-foot ledge which prospects well in both free gold and sulphurets, and it is reported that a ten-stamp mill will be erected on the mine in the spring.

L. C. Jacobs, of Oroville, and Morris Laughton, of Lumpkin, are also doing considerable work upon a recently discovered ledge near the Birmingham & Bills' mine, with equally as good prospects. In years past several arrastras have been built and operated upon ledges in this vicinity, and considerable gold obtained, but the process of working was too slow, as well as not favorable to the saving of the gold and the method has been abandoned; but it is believed that, with stamps and improved machinery, several of the ledges already uncovered will pay well.

L. L. Myers, superintendent of the Spring Valley Gold Co., of Cherokee, in company with others, is at work upon a quartz ledge on the east side of the Middle Fork of Feather river, near the old Meachum mine. This ledge is supposed to be an extension of the Crystal Hill mine, and is about four feet wide. The parties having the work done are men of capital, and it is reported that they are well pleased with the prospects so far obtained. The Crystal Hill mine had a mill upon it away back in the '50's, and considerable gold was obtained from a short run; but, like most of the early quartz mining, more gold was lost than saved. The mill was moved away and the mine abandoned. It is said that parties afterward cleaned up over $700 in amalgam just below where the tailings from the mill were dumped.

Morse & Co., who have been running a tunnel to strike a quartz ledge on New York Flat for some time past, have finally got through and struck the ledge, which is well defined and prospects well. The tunnel is over 250 feet long and is substantially built. It is quite probable that a mill will be built upon the ledge at no distant day. Rock taken out of the tunnel shows as good ore as any in the district. The owners have labored long and hard and spent much money in running the tunnel, and everybody unites in the wish that they have struck a bonanza. The mine is situated about 1½ miles from Forbestown, on New York Flat, a flat very rich in placer mines in days gone by.

The Denver mill, near Forbestown, is ready to commence crushing ore and only awaits the completion of the ditch, which is to furnish the power, to start up.

Work upon the Bullion mill, about a mile west of Forbestown, is being pushed forward with all possible speed, but the bad weather and roads are making it slow at the best, and it will be a month before the mill is completed.

W. A. Williams, superintendent of the Burlington mine, has a force of men driving a tunnel to tap the ledge at a low level. This mine is situated within half a mile of the business portion of Forbestown.

Inyo.

GOOD STRIKE.—*Register*: A good strike is reported from the Georgia mine in Redding canyon. An 18-inch ledge of good gold ore is in sight.

Nevada.

THE CALIFORNIA.—*Telegraph*: The California mine, now called the Gaston Ridge, is being actively prospected. The mine is near Eureka South, and is the one which Patrick Foley used to superintend. Just now there is very heavy machinery being shipped to the mine, and that machinery will soon be in operation. Twenty stamps will be grinding out quartz from the mine in a short time. Mr. Eddridge Newton is the superintendent of the mine. He has been mining in Siberia and in North China, and is thoroughly acquainted with all the details of mining.

THE PENNSYLVANIA.—*Tidings*: Superintendent Eddie reports everything looking first-class at the Pennsylvania mine. The ledge in the bottom of the shaft looks well and the drifts are being steadily driven ahead.

A GOOD MINE.—*Herald*: The West Harmony gravel mine is turning out some fine quartz boulders, which are found in the gravel, and which are rich in free gold. Superintendent McCall has saved a number of pieces which show bright leaf gold, in fantastic shapes, and will send them to the Midwinter Fair.

MINE TO BE SOLD.—*Transcript*, Dec. 22: For some time past negotiations have been going on for the purchase of the Murchie Mining Company's property, about two miles from Nevada City, and it is said, upon good authority, that within a week or ten days the sale will be made. The parties who are to purchase the property are all wealthy Germans of San Francisco, and after as good an examination as could be made they were satisfied with the property and the price and agreed to take it. As soon as they get the property they propose to work it on a very extensive scale, and will erect a larger stemp mill than there is in the county at the present time. That means employment for a hundred or more men as soon as they can get the mine in a condition to do so. The mine consists of about 400 acres of patented ground, and there is a complete network of quartz ledges running through the whole property. Those who know say there are thousands of tons of low-grade ore in one of the mines alone, and this the new company proposes to work.

J. V. Brooks, who recently purchased the Turner mine at Hunt's Hill, ordered Friday from the East one of Bennett's amalgamating machines, to be shipped immediately. Mr. Brooks expects to receive it here within 90 days. It will be the largest machine of the kind on the coast.

H. W. Morris, principal owner of the Boss mine, near Sweetland, was in town Friday. He reports everything looking well at the mine, the developments thus far exceeding the company's most sanguine expectations. Work is progressing nicely. Mr. Morris went to San Francisco on Friday. While below he will order six more Huntington mills sent to the mine. When these are ready to run the number of employes will be increased.

Thomas Fairweather, who has been for some time past working the White Diamond mine, which is situated above the Derbec mine, in Bloomfield township, struck very rich quartz the other day. He has a shaft down 75 feet on the ledge.

Jay Ostrom of Bloomfield was in town on Friday. He has for some time been working a gravel mine near that place and has lately struck rich gravel containing coerse gold. One piece was found that was worth $4.80.

The Derbec drift gravel mine is looking better than for a long time. Twenty-five men are employed on day shift, and they are taking out fine gravel.

ANOTHER MINE SOLD.—*Transcript*: J. V. Brooks, the mining man from Louisville, Kentucky, who has been in this county for the past two weeks looking for a mine for Eastern capitalists, has purchased the Mistletoe mine at Rough and Ready. It is said to be a good mine and will be worked on an extensive scale.

BOUGHT A NEW PUMP.—*Transcript*: Of late the volume of water in the San Jose gravel mine has increased so rapidly that it became impossible to handle it successfully with the pump used. A larger pump has been purchased and will be taken to the mine and set to work without delay. The gravel that is being taken out is quite rich.

ELECTRIC LIGHTS FOR THE CHAMPION.—*Transcript*, Dec. 21: Supt. Zeitler informs us that the dynamo ordered for the Champion mine was expected here to-day. The work of setting it in place and running the wires will be commenced without delay, and, if nothing happens, the mine, mill, hoisting works and chlorination works will be lighted with electricity by the 1st of January. The incandescent lamps will be of 80-candle power, and will be used under and above ground.

Placer.

THIRTY-FIVE MEN WORKING.—Colfax *Sentinel*, Dec. 23: Up near Cape Horn the South Yuba Canal Company has about 35 men at work digging the ditch and clearing brush. The men were making rapid progress until yesterday, when they were forced to suspend work on account of the rain.

PROSPECTS WELL.—Colfax *Sentinel*: The Willis Gould mine, situated on the ridge about three miles above the Morning Star mine, is rapidly developing into a good mine. Mr. Gould has been working this mine alone for several years past and some time ago broke through into the main channel of the divide, and found a bed of pay gravel some 60 feet

wide, which pays from $5 to $11 a carload. Lest week he bronght $150 to Iowa Hill in nice smooth gold, and Sunday he brought in a nugget that weighed $22. There is a fine chance for some person who has the meens to rnn ahont 500 feet of bedrock tunnel to meke a good investment.

FAVORABLY IMPRESSED.—Colfax *Sentinel*: Two expert miners named W. H. Ronse of Oekland and W. B. Stanley of Virginia City were in Colfax last week on mining bnsiness. They investigated the large ledge on Gillis Hill, about two miles below here. The ledge is an extensive one, being some 20 feet between the walls, and shows well in free gold. The property is well located and affords an excellent opportunity for tapping the ledge at a good depth by the tunnel process. The gentlemen were very favorably impressed with the prospect.

Shasta.

SHASTA COAL.—Redding *Free Press*, Dec. 23: Jay Conklin, the veteren coal miner, who for ten years pest hes been trying to develop the coal deposits lying in the Ronnd Mountain district, about 25 miles from Redding, says that the coal of Round mountain is not excelled for heating purposes hy that eold in the San Francisco market; hut he realizes that the distance from market makes it at present of little valne. Perhaps, with river transportation, Shasta county coal will become valuable. If Mr. Enright extends his road, the coal conld be sent to the river at a trifling expense and loaded on barges.

GOOD PROPERTY.—Redding *Free Press*: Since the Iler brothers returned from Galt, they have been faithfully at work on their mine near Slick rock, ahove Flat creek. They fonnd a 40-foot cave in the tunnel, which they cleared away, putting in new timhers. There is no question regarding the valne of their property, which inclndes six good locations. The main tnnnel, which is 300 feet long, is the key to quite a number of ledges. From the mouth of the tnnnel to the top of the mountain it is 300 feet. The boys will force the tunnel throngh the hill, a distance of 200 feet farther. This will open up a vast hody of ore which is ahont the same grade and quality as the ore fonnd in the Uncle Sam, in the same range.

In the winter of 1889, M. Chapman, while crossing the mountains into the Happy Camp section, discovered some fine qnartz, showing free gold. Ae the snow was very deep, he postponed looking for the ledge nntil the following summer, when, accompanied by three others, he spent three weeks searching for it, but conld find neither the ledge nor the place where he had picked np the specimens. Each snceeding snmmer he renewed the qnest, with no better snccess. A few days ago, however, he received a letter from his pertner, a Mr. Johnson, saying that he had fonnd the ledge and thet it is very rich. In the first specimens found the gold was eesily visible to the naked eye, and the discoverers no donbt have a paying property.

NEVADA.

White Horse District.

ON A NEW LONE.—A representetive of the Wadsworth *Dispatch* has an interesting acconnt of that new mining district. He says:

Striking ont with one of Crosby's livery teems toward the range of monntains about five or six miles northwest of Wadsworth, after a pleasent drive of an honr the writer ceme to the foot of the White Horse canyon, where is located the Addie C. claim, at which he fonnd a sheft. It is being worked by Mexicans sent from Sen Jose by capitalists. The sheft was 35 feet deep and drifts were running eest and west in search of a prospect. The resnlt was the finding of a three-foot ledge of gold rock. Nnmerons semples have been sent to San Jose, and the returns must have heen satisfactory enongh to keep the three men delving.

The next prominent cleim was the Eest Jim Blaine, upon which some prospecting has been done. However, as this claim joins the Jim Blaine, it was considered valuable enough by its owners to be offered under a bond of a year's time for $25,000. These figures were given in compliance to a request made hy an expert who visited the district in the interest of San Francisco capitalists. The Pay Car claim was, nnder the same conditions, placed at $15,000. These claims are not developed, and the croppings only prospected and assayed.

The Jim Blaine mine, owned by Ned Gregory, and being worked under bond by Sacramento psople, is the farthest of the claims in the district and the canse of the excitement at White Horse. A dozen assays taken from this mine range from $30 per ton npward in gold, and attracted attention to the district. The Jim Blaine shaft is down 93 feet, and when it is 100 feet deep, by the terms of the bond, crosscntting will commence and the width of the ledge will be determined. Regardless of the width of the ledge there is ore enongh in sight to pay donble the amonnt for which the mine is bonded.

At White Horse City we fonnd a typical young mining camp of four houses and lumber for more. It is known as the Coal Camp from the fact that a small seam of first-class coal was found at the point some 17 years ago, hut after sinking some $5000 the finders abandoned the coal mine.

Tonching White Horse City is the Emma L. mine, owned hy the Wæsheim brothers. Here is a two-foot ledge with some very rich gold rock in it. This claim promises to pay big from the surface, and some of the specimens taken from this ledge would ornament any cabinet. This claim is held at $50,000, the owners offering to hond for that amount. The claim is covered with rich streaks, as indicated by the croppings, and if they come together, look ont for a famous mine. Jnst over the hill are the Tigers, Black Point and Bi-Metallic, which are held in pool for hond at $30,000.

The Washoe Company is running a tunnel, and hope to realize sanguine expectations in about six weeks. They have very rich croppings, and will strike the ledge 200 feet from the snrface when the tunnel is 150 feet. Miners at the Royal are tunneling for the main ledge, which they expect to reech very soon; in the meantime they are enconntering pay rock right along, but are anxious to see what it looks like "in there."

The North Broncho is econnted a "sure thing," with a good ledge cropping ont at the lowest point in the gully. The claim is between the Royal and the Washoe Company's Sunset. Then there is the Manhattan, and Andy swears by it, end the indications are first-class. We have confidence in the good angel.

There are a number of claims in the district owned hy parties at Reno and Wadsworth. The croppings all prospect, and as soon es a little work is done the owners will know e little more abont them.

BRITISH COLUMBIA.

IN THE SLOCAN.—Nelson *Tribune*, Dec. 14: Every available team is now engaged in hanling ore from the mines in Slocan district, and by New Yeers the ontpnt landed at the wharf at Kaslo, or at the ore-sheds at Three Forks, will aggregate 30 tons a day. There are now 23 regnlar freight teams on the road between Three Forks and Kaslo. George W. Hnghes is hauling the output of the Idaho, the Monntein Chief end the Noble Five gronp. He is also making a trail to the Snrprise, the claim thet was purchased last week by E. W. Ferguson of Chicago for $60,000, helf spot cesh. There are over 150 tons of ore sacked at the Snrprise, and Hughes hes the contrect to haul it to Keelo. Snrprise is adjacent to the Noble Five gronp, and was located in Jnly, 1892. A man named Jennings end Thomes McGnigan were the owners. Hugh Mann has a contract for hanling 500 tons, and as mnch more as he can haul, from the Slocan Star to the ore-shed at Three Forks. Gilliam & Pound are raw-hiding ore from the Washington to the road, where it is forwarded to Kaslo by a teemster named Mitchell.

The following mines are being worked: Freddie Lee, Slocan Star, Enreka, Noonday, Rico, Surprise, Washington, Bonanza King, World's Fair, Sepphire, Alamo, Idaho, Mountain Chief, Dardanelles and Northern Belle. Work was suspended on the Wellington this week, Snperintendent Watts and Foreman Robb both leaving for the East. Tenders ere being asked for a 200-foot tunnel on the Alpha, one of the Grady gronp. Everything considered, the ontlook is good for a large output of ore from Slocan mines this season.

A STRIKE AT AINEWORTH.—Nelson *Miner*, Dec. 16: News of a new aod valuable strike has been received from Ainsworth. Last week while the men were engaged in rnnning a joint tnnnel on the boundary line between the Black Diamond and the Little Phill, they suddenly broke into a strong vein of gelene. When enough had been done to size np the new and it proved to be 8½ feet of clean galena ore that will run 80 or 90 onnces in silver and about 75 per cent lead.

The Black Diamond is owned by J. Stevens, chief engineer of the Great Northern, and the Little Phill is the property of Tom McGovern and Capt. Heyword.

OREGON.

THE SIMMONS' DAM.—Rogue River *Courier*: Tbe carrying away of the Simmons' dam is bad for the Waldo conntry, as it throws a nnmber of men ont of employment and forces the owners to discontinue piping for the seeson. This rich placer annnelly distribntes thonsands of dollars in the southern end of this connty, besides netting a handsome cleannp for its owners. The valne of the dem was probably ahont $500, hut its loss is small compared to loss of the seeson's run.

MONTANA.

TO DRIVE A LONG TUNNEL.—Bntte *Inter-Mountain*: When President McLure of the Granite Monntain Mining Company was in this city a few days ago, he divulged some interesting news which may be considered perfectly reliable. The directors of the Granite and Bi-Metallic companies were in Philipsburg and vicinity dnring the past two weeks and mnch anxiety was felt in that neighborhood over what the visit of the mining men might mean.

The Granite Mountain and Bi-Metallic companies will, jointly, drive a tunnel one and one-half miles long. This will tap the Granite vein at a depth of 1400 feet and the Bi-Metallic vein at abont 1100 feet. The estimated cost of this work will be between $350,000 and $400,000. It is expected to have the big bore through in 18 months. This will be fast time, hut work will be carried on through more than one opening. Levels will be run from the present workiogs of the two mines and the shafts will be developed to the same depth as the tunnel.

The main pnrpose in doing this work at this time, Mr. McLure says, is to give employment to men. Under the contemplated programme of work it is thought from 200 to 300 men can be utilized, as work will be going on in several portions of the two mines at once. The surveys for the work have been already completed. All this new work is to be let out by contract, and it is the intention to have it in progress on or about the first day of January. All work will be paid for in silver coin. It is a fact nowadays that the Granite people will not pay for anything in other than silver coin.

It is proposed by this tunnel to keep the properties drained of water and to lessen the expense of pnmping. It is expected, however, by the time the long tunnel is completed silver will have received more favorable recognition.

Another new enterprise decided npon is the building of a suitable mill for working the tailings on hand. It is estimated the Granite company has about 200,000 tons of tailings. The tailings mill is to be huilt very soon.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DECEMBER 12, 1893.

510,668.—SELF-LAYING TRACK—A. P. Andereon, Oriental, Nev.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notioes of Reoent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER FILTER.—C. K. Lamb, S. F., Cal. No. 511,149. Dated Dec. 19, 1893. This invention relates to certain improvements in water filters, preferably adapted to be attached directly to the discharge pipe through which water is conducted. It consists of a case having a hermetically closed removable top and a conical or funnel-shaped bottom, with a peculiar valve or cock by which the direction of water from the inlet pipe may be changed or cut off at will, so that water may either be drawn directly from the cock through a pipe extending below the bottom of the filter, or directed up through the filter and drawn through a discharge pipe leading from the upper part of the filter, or, lastly, from the chamber beneath the filter, so as to wash out any collecting sediment. The filtering material rests upon a perforated filter bottom, and above it is an inclined perforated filter plate through which the water passes to the upper chamber after having been filtered. Whenever the cock is turned so as to admit water into the filter, the direct discharge passage is cut off and water passes up through the filter and thence through the discharge pipe at the top. When the cock is turned to cut off the supply of water, that which remains in the conical chamber beneath the bottom filter plate is free to escape through the bottom discharge passage, and the sediment is thus washed out every time the filter is used.

RAILWAY RAIL JOINT.—Leonard W. Kennedy, Oakland, Cal. No. 510,268. Dated Dec. 5, 1893. This invention relates to an improved joint for railways. Difficulty is experienced in making suitable joints between the meeting ends of railway rails; on account of the constant pounding and variation of weight when heavily loaded trains pass over such joints they are continually rising and falling with reference to each other, and the passage of the wheels over these unequally supported ends causes a constant hammering which soon spreads and batters the rail. This invention contemplates the interposition of an anvil block or support which extends between the meeting ends of the rails and serves as a tie or support thereof. These anvils are made in various forms and interposed either by cutting away the lower flange and part of the web of the rail and allowing the head and upper portion of the two rails to abut over this anvil, or by cutting out also a portion of the head of the rail and extending a correspondingly shaped section of the anvil up between the meeting ends of the rails. This extended portion may be essentially rectangular in its horizontal section or it may have vertical channels of a V-shape, and the ends of the rails correspondingly shaped to fit. Suitably shaped fish-plates extend upon either side of these supports and along the webs of the abutting rails to which they are secured. In some cases the support block has transverse extensions which slope downwardly each way from the rails and are bolted upon the ties or other supports, the rails abutting against these supports as previously described. If preferred, the anvil block may be rolled with the fish-plate upon one side, forming a part of it, and this will be bolted to the abutting rails, while the separate fish-plate will be bolted upon the opposite side in the usual manner. This device reinforces and strengthens the rail joints, makes them smooth by dividing the spaces allowed for expansion, and the solid interposed anvil base receives the principal force of the blow of the wheels, thus protecting the ends of the rails and preventing their brooming; and it also eliminates the hinge motion of the present form of joints and prevents the blowing of dry dust or the pumping of the soft, wet material when the roadbed is wet, so that the track is preserved even and smooth and the cost of maintaining a roadbed and rolling stock is reduced.

SHAVING BRUSH.—Gilbert L. Belcher, Oakland, Cal. No. 510,152. The object of this invention is to provide what may be termed a fountain shaving brush. It consists of a brush having a hollow handle forming a reservoir which is filled with a soap paste of the proper character for shaving purposes. The end of this handle or reservoir is so formed as to receive the upper fixed ends of the bristles which form the brush and retain them permanently in place. The diaphragm or partition which separates the bottom of the chamber from the bristles is perforated, having an opening or tube leading from the chamber into the space between the bristles. The opposite end of the chamber is provided with the plunger which is movable by screwing or otherwise so as to force the paste through the opening and into and among the bristles. Any quantity may be thus forced into the bristles, and, by simply wetting the brush and passing it over the face, a suitable lather will be formed for shaving. This brush is very useful for travelers and others who wish to avoid the annoyance of separate soap boxes, hot-water cups, etc.

PICTURE BLOCK.—Oscer Waihel of S. F., Cel. No. 510,216. Dated Dec. 5, 1893. This invention consists of a nnmber of blocks nnited throngh diagonal plenes by a flexible connection, so thet the blocks may be turned into various positions with relation to eech other, to form figures and desigos of varied character. Tbere are several strings of these blocks end their snrfaces are so ornamented as to form perts of a complete design, reached only by long stndy and careful manipulation in tnrning all the blocks and uniting the several strings.

Justinian Caire.

One of the names familiar to tbe mining regions of tbis coast is that of Justinian Caire, agent of the San Francisco Novelty and Plating Works, wbo, as a provider of mining and milling supplies of all descriptions, has made his large establishment in this city useful to all engaged in quartz, gravel and placer mining; and he makes it his special busioess to see that each appliance is of the best, most durable and most efficient in use. One specialty is the silver-plated amalgamating plates, which have stood the test of long use and which are in high favor among millmen. Each plate is guaranteed to have full weigbt of silver and to be of the best quality of workmanship. The best soft Lake Superior copper is used.

The list of assayers and chemists' supplies is very complete. He furnishes, among other things, a $90 outfit for assayers and prospectors, which comprises all apparatus and chemicals necssary to fit up a small establishment. This outfit enables many a miner and prospector, with a little experience, to do much of his own assaying, especially in remote places where access to competent persons is difficult. The list of drawing instruments is large and varied. Text books on chemical and metallurgical subjects at all likely to be in demand are kept in stock. Chemicals and compounds for assayer's use, reducing ores, etc., are on hand in packages of convenient size, many in ounce bottles, chemically pure for tests. Commercial acids, bone ash, blue stone, copperas, and many other supplies, are made by Mr. Caire. A specialty is made of cyanide of potash. One other thing to which the attention of the public should be directed is the wire cloth and screens and other wire goods made by the Excelsior Wire Works. Customers are supplied with whatever style and mesh of cloth is desired, whether of brass, copper, iron or steel. The firm also makes it its invariable policy to give the public the benefit of any change in quotations on chemicals or other articles kept in stock.

DIVIDEND NOTICE

THE GERMAN SAVINGS AND LOAN SOCIETY,

526 CALIFORNIA STREET.

For the half year ending December 31st, 1893, a dividend hee been declared at the rate of five and one-tenth (5 1-10) per cent per annum on term deposits, and four and one-quarter (4¼) per cent per annum on ordinary deposits, payable on and after Tuesday, January 2d, 1894. GEO. TOURNY, Secretary

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 28, 1893.

Silver has shown improvement in London during the week, but has, on the contrary, declined in New York. Congress is in recess, and no progress has been made toward silver legislation.

Change in Quicksilver.

For several days past some small lots of quicksilver have been pressing on the local market at prices considerably lower than the asking rates previously quoted. Holders of these parcels have shown particular anxiety to realize, and, as a consequence, the market is now in a very unsettled condition. Offers to sell at $35 per flask were promptly met by leading receivers at $34.50, as against $40.50 to $41 previously asked for home consumption. At present there is hardly any local demand, and export orders have been filled recently at a sweeping reduction. In the meantime the London market has undergone no change.

Silver and the Metals.

Copper has fluctuated, but closes the week in fairly good position. Lead shows no improvement in price, but the market is somewhat stronger.

NEW YORK, Dec. 28.—Following are the closing prices for the week:

	Silver in—

Mining Share Market.

SAN FRANCISCO, Dec. 28, 1893.

The Comstock market has been neglected during the holidays. During last week the fluctuations were small, but gradually weakening. Tuesday, after the holiday, the market opened quietly. As a rule, however, prices were steady and a few stocks had a firmer tone. Yellow Jacket, in the Gold Hill group, and Andes at the north end of the list, had a sharp little advance. After the first session, Consolidated California and Virginia moved up to $2.95, and there was a better feeling. Then came a weaker range of prices.

Wednesday was another quiet day. The offerings of the Comstock shares were small, however, and with a few exceptions prices opened with a steadier tone, which developed into firmness as noon approached. Most of the trade was among the regular army of the street. Mining stocks are not the only branch of business which is quiet. At the banks and in commercial and general trade circles the dullness incidental to the holidays and other causes prevails.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Cal. Debris Commission Notices.

THE CALIFORNIA DEBRIS COMMISSION having received petitions to mine, by the hydraulic process, from W. R. Stewart, in the Badger mine near Cno, Shasta Co., and to deposit tailings on adjacent flats; from Clonzo Eagle, in the Walker mine, near Ico, Shasta Co., to deposit tailings behind dams in Pomeroy Gulch; from McKinstry & Gilbert, in the Christmas Hill Seam diggings, near Butcher Ranch, Placer Co., to deposit tailings on the banks of a fork of the American river; from W. R. Read, in the Tannery Ravine mine, near Challenge Mills, Yuba Co., to deposit tailings behind dams in Tannery Ravine; from Manuel Mateos, in the Mateos mine, near Sierra City, to deposit tailings in Howard creek; from Jos. Davie, in the Davis mine, near Sierra City, to deposit tailings in Howard creek; from Frank Barbero, in the First Chance mine, near Sierra City, to deposit tailings behind dams in Howard creek; from Philip McGuire, in the North Star mine, near Mokelumne Hill, Calaveras Co., to deposit tailings behind dams in Buckeye Gulch, and from J. W. Smith, in the Green Mountain mine, near Mokelumne Hill, to deposit tailings behind dams in Chile Gulch, and from the 54 Flat Placer Mining Co., in the 54 Flat mine, near Volcano, Amador Co., Cal., to deposit tailings behind dams in a dry ravine—gives notice that a meeting will be held at Room 92, Flood Building, San Francisco, on January 2, 1894, at 1:30 P. M.

Assessment Notices.

STANDARD GOLD AND SILVER MINING COMPANY. Location of principal place of business, San Francisco, Cal. Location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of December, 1893, an assessment, No. 1, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 4, No. 330 Pine Street, San Francisco, Cal., or to the President, Tyler Beach, St. James Hotel, San Jose Cal. Any stock upon which the assessment shall remain unpaid on the 26th day of January, 1894, will be delinquent, and advertised for sale at public auction; and unless payment be made before, will be sold on SATURDAY, the 17th day of February, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. T. E. JEWELL, Secretary.

Office—Room 4, 330 Pine Street, San Francisco, Cal.

DELINQUENT SALE NOTICE.

CO-OPERATIVE PRINTING CO., 408 Sacramento St., S. F., Cal.

NOTICE.—There is delinquent upon the following described stock, on account of assessments levied on the 22d day of November, 1893, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
H. P. Brown	2	330	$660 00
Morgan Backus	3	330	660 00
Geo. W. Craddock	6	50	100 00
E. L. Walcott	8	280	560 00
T. P. Robinson (not issued)	9	330	660 00

And in accordance with law and an order of the Board of Directors made on the 22 day of November, 1893, so many shares of each parcel of such stock as may be necessary, will be sold, at the office of the Company, 408 Sacramento St., S. F., Cal., on the 5th day of January, 1894, at 12 o'clock noon of such day, to pay delinquent assessments thereon, together with the costs of advertising and expenses of the sale.

MORGAN BACKUS, Secretary.

408 Sacramento St., S. F., Cal.

FOR SALE OR RENT.

THE TOSTON SMELTER.

Specially adapted for pyritic smelting. Capacity 100 tons per diem. On the Northern Pacific R. R., within a few miles of the extensive gold deposits of Radersburg, St. Louis, Winston, etc. Apply

Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

68 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiere, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing the supplies since the first discovery of mines in the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents of the **Denver Fire Clay Co.** and for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

NOTICE TO MINE OWNERS!

The undersigned will have in operation at the Midwinter Fair a complete free gold and concentrating plant, where they will work, free of charge, any lots of ore from one to five tons.

For further information address them at 213 First Street, San Francisco.
